 show postgresql [ [ [name] | [glob] | [regex] ] ... ]  
 show running-config postgresql  
 show running-config postgresql [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
   all-properties  
   non-default-properties  
   one-line  
   partition

**DELETE**  
 delete postgresql [name]

Note: You cannot delete default monitors.

**DESCRIPTION**  
 You can use the postgresql component to configure a custom monitor, or you can use the default PostgreSQL monitor that the Local Traffic Manager provides. This type of monitor verifies PostgreSQL-based services.

**EXAMPLES**  
 create postgresql my\_postgresql defaults-from postgresql

Creates a monitor named my\_postgresql that inherits properties from the default PostgreSQL monitor.

list postgresql

Displays the properties of all of the PostgreSQL monitors.

**OPTIONS**

**app-service**  
 Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

**count**  
 Specifies the number of monitor probes after which the connection to the database will be terminated. Count value of zero indicates that the connection will never be terminated. The default value is zero.

**database**  
 Specifies the name of the database with which the monitor attempts to communicate. The default value is none.

**debug**  
 Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

**no** Specifies that the system does not redirect error messages and additional information related to this monitor.

**yes** Specifies that the system redirects error messages and additional information to the

/var/log/monitors/--.log file.

**defaults-from**

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is postgresql.

**description**

User defined description.

**destination**

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

\*:\* Specifies to perform a health check on the IP address and port supplied by a pool member.

\*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**interval**

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 30 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**manual-resume**

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**

Displays the administrative partition within which the component resides.

**password**

Specifies the password if the monitored target requires authentication. The default value is none.

**recv** Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is included in a field in your database. If you do not specify a value for both the send and recv options, the monitor performs a simple service check and connect only.

**recv-column**

Specifies the column in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

**recv-row**

Specifies the row in the database where the system expects the specified Receive String to be located. Specify this option only if you configure the send and recv options. The default value is none.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**send** Specifies the SQL query that the monitor sends to the target database, for example, SELECT count(\*) FROM mytable.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if not null.

**time-until-up**

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 91 seconds.

If the target responds within the set time period, it is

considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

**up-interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

**Important:** F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**username**  
Specifies the username, if the monitored target requires authentication. The default value is none.

## ltm monitor radius-accounting

**NAME**  
radius-accounting - Configures a RADIUS accounting monitor for the BIG-IP(r) Local Traffic Manager.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the radius-accounting component within the ltm monitor module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create radius-accounting [name]  
modify radius-accounting [name]  
options:  
app-service [[string] | none]  
debug [no | yes]  
defaults-from [ [name] | none]  
description [string]  
destination [ip address]  
interval [integer]  
manual-resume [disabled | enabled]  
nas-ip-address [ip address]  
secret [string]  
time-until-up [integer]  
timeout [integer]  
up-interval [integer]  
username [none | [string] ]  
  
edit radius-accounting [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
  
**DISPLAY**  
list radius-accounting  
list radius-accounting [ [ [name] | [glob] | [regex] ] ... ]  
show radius-accounting [ [ [name] | [glob] | [regex] ] ... ]  
show running-config radius-accounting  
show running-config radius-accounting [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition  
  
**DELETE**  
delete radius-accounting [name]

Note: You cannot delete default monitors.

**DESCRIPTION**  
You can use the radius-accounting component to configure a custom

monitor, or you can use the default RADIUS accounting monitor that the Local Traffic Manager provides. This type of monitor provides information about the usage of the RADIUS service for accounting purposes.

#### EXAMPLES

```
create radius-accounting my_radius_acct defaults-from radius_accounting
```

Creates a monitor named `my_radius_acct` that inherits properties from the default RADIUS accounting monitor.

```
list radius-accounting
```

Displays the properties of all of the RADIUS accounting monitors.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

##### debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

`no` Specifies that the system does not redirect error messages and additional information related to this monitor.

`yes` Specifies that the system redirects error messages and additional information to the `/var/log/monitors/--.log` file.

##### defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is `radius`.

##### description

User defined description.

##### destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is `*:*`.

Possible values are:

`*:*` Specifies to perform a health check on the IP address and port supplied by a pool member.

##### \*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

##### IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

`glob` Displays the items that match the glob expression. See `help glob` for a description of glob expression syntax.

##### interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 10 seconds.

Important: F5 Networks recommends that when you configure this option and the `up-interval` option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

##### manual-resume

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the `manual-resume` option is disabled.

Note that if you set the `manual-resume` option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

##### nas-ip-address

Specifies the network access server IP address that the system uses to identify itself to the RADIUS server. Using this option, multiple BIG-IP(r) systems can appear as a single network access device to the RADIUS server. The default value is none.

##### partition

Displays the administrative partition within which the component resides.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

**secret**  
Specifies the secret the monitor needs to communicate with the resource. The default value is none.

**time-until-up**  
Specifies the amount of time in seconds after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

**up-interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**username**  
Specifies the username, if the monitored target requires authentication. The default value is none.

## ltm monitor radius

**NAME**  
radius - Configures a Remote Access Dial-in User Service (RADIUS) monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the radius component within the ltm monitor module using the syntax in the following sections.

```
CREATE/MODIFY
create radius [name]
modify radius [name]
options:
  app-service [[string] | none]
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ip address][port]
  interval [integer]
  manual-resume [enabled | disabled]
  nas-ip-address [ [ip address] | none]
  password [none | [password] ]
  secret [none | [secret] ]
  time-until-up [integer]
  timeout [integer]
  up-interval [integer]
  username [ [name] | none]

edit radius [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list radius
list radius [ [ [name] | [glob] | [regex] ] ... ]
show radius [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config radius
show running-config radius [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
DELETE
delete radius [name]
```

Note: You cannot delete default monitors.

#### DESCRIPTION

You can use the radius component to configure a custom monitor, or you can use the default RADIUS monitor that the Local Traffic Manager provides. This type of monitor verifies the RADIUS service by attempting to authenticate the specified user.

#### EXAMPLES

```
create radius my_radius defaults-from radius
```

Creates a monitor named my\_radius that inherits properties from the default RADIUS monitor.

```
list radius
```

Displays the properties of all of the RADIUS monitors.

#### OPTIONS

app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is radius.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

\*:\* Specifies to perform a health check on the IP address and port supplied by a pool member.

\*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 10 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

manual-resume

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

nas-ip-address

Specifies the network access server IP address that the system

uses to identify itself to the RADIUS server. With this option, multiple BIG-IP systems can appear as a single network access device to the RADIUS server. The default value is none.

**partition**  
Displays the administrative partition within which the component resides.

**password**  
Specifies the password if the monitored target requires authentication. The default value is none.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**secret**  
Specifies the secret the monitor must use when contacting the resource. The default value is none.

**time-until-up**  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

**up-interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**username**  
Specifies the username, if the monitored target requires authentication. The default value is none.

## ltm monitor real-server

**NAME**  
real-server - Configures a RealServer(r) monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the real-server component within the ltm monitor module using the syntax in the following sections.

**CREATE/MODIFY**  
create real-server [name]  
modify real-server [name]  
options:  
app-service [[string] | none]  
defaults-from [name]  
description [string]  
interval [integer]  
metrics [ [metrics] | none]  
time-until-up [integer]  
timeout [integer]

```

edit real-server [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list real-server
list real-server [ [ [name] | [glob] | [regex] ] ... ]
show real-server [ [ [name] | [glob] | [regex] ] ... ]
show running-config real-server
show running-config real-server [ [ [name] | [glob] | [regex] ] ... ]
options:
  agent
  all-properties
  command
  method
  non-default-properties
  one-line
  partition

DELETE
delete real-server [name]

```

Note: You cannot delete default monitors.

#### DESCRIPTION

You can use the real-server component to configure a custom monitor, or you can use the default RealServer monitor that the Local Traffic Manager provides. This type of monitor checks the performance of a pool, pool member, or virtual server that is running the RealServer data collection agent, and then dynamically load balances traffic accordingly.

#### EXAMPLES

```
create real-server my_real-server defaults-from real_server
```

Creates a monitor named my\_real-server that inherits properties from the default RealServer monitor.

```
list real-server
```

Displays the properties of all of the RealServer monitors.

#### OPTIONS

**agent**  
Displays the agent for the monitor. The default agent is Mozilla/4.0 (compatible: MSIE 5.0; Windows NT). You cannot modify the agent.

**app-service**  
Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

**command**  
Displays the command that the system uses to obtain the metrics from the resource. See the documentation for this resource for information on available commands. You cannot modify the command.

**defaults-from**  
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is real-server.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**interval**  
Specifies the frequency at which the system issues the monitor check. The default value is 5 seconds.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**method**  
Displays the GET method. You cannot modify the method.

**metrics**  
Specifies the performance metrics that the commands collect from the target. The default value is ServerBandwidth:1.5, CPUPercentUsage, MemoryUsage, TotalClientCount.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**time-until-up**  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

SEE ALSO

## ltm monitor rpc

NAME

rpc - Configures a Remote Procedure Call (RPC) monitor.

MODULE

ltm monitor

SYNTAX

Configure the rpc component within the ltm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create rpc [name]
modify rpc [name]
options:
  app-service [[string] | none]
  debug [no | yes]
  defaults-from [name]
  description [string]
  destination [ip address] [port]
  interval [integer]
  manual-resume [enabled | disabled]
  mode [tcp | udp]
  program-number [ [integer] | none]
  time-until-up [integer]
  timeout [integer]
  up-interval [integer]
  version-number [ [integer] | none]
```

```
edit rpc [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list rpc
list rpc [ [ [name] | [glob] | [regex] ] ... ]
show rpc [ [ [name] | [glob] | [regex] ] ... ]
show running-config rpc
show running-config rpc [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete rpc [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the rpc component to configure a custom monitor, or you can use the default RPC monitor that the Local Traffic Manager provides. This type of monitor queries the RPC server, and verifies the availability of a given program.

EXAMPLES

```
create rpc my_rpc defaults-from rpc
```

Creates a monitor named my\_rpc that inherits properties from the default RPC monitor.

```
list rpc
```

Displays the properties of all of the RPC monitors.

## OPTIONS

### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

### debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks.

The default value is no. The options are:

**no** Specifies that the system does not redirect error messages and additional information related to this monitor.

**yes** Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

### defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is rpc.

### description

User defined description.

### destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

**\*.\*** Specifies to perform a health check on the IP address and port supplied by a pool member.

### \*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

### IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

### interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 10 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

### manual-resume

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

**mode** Specifies the protocol that the monitor uses to communicate with the target. The default value is tcp.

The options are:

**tcp** Specifies that the monitor uses the TCP protocol to communicate with the target object.

**udp** Specifies that the monitor uses the UDP protocol to communicate with the target object.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

### partition

Displays the administrative partition within which the component resides.

### program-number

Specifies the number of the program for which you want the monitor to verify availability. The default value is none.

### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

### time-until-up

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

#### timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

#### up-interval

Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

#### version-number

Specifies the number of the version for which you want the monitor to verify availability. The default value is none.

#### SEE ALSO

create, delete, edit, glob, list, modify, regex, show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## ltm monitor sasp

#### NAME

sasp - Configures a Server Application State Protocol (SASP) monitor.

#### MODULE

ltm monitor

#### SYNTAX

Configure the sasp component within the ltm monitor module using the syntax in the following sections.

#### CREATE/MODIFY

create sasp [name]

modify sasp [name]

show running-config sasp

show running-config sasp [ [ [name] | [glob] | [regex] ] ... ]

#### options:

all-properties  
non-default-properties  
one-line  
partition

#### DELETE

delete sasp [name]

Note: You cannot delete default monitors.

## DESCRIPTION

You can use the sasp component to configure a custom monitor, or you can use the default FTP monitor that the Local Traffic Manager provides. This type of monitor verifies the availability of IBM Group Workload Managers network resources.

## EXAMPLES

```
create sasp my_sasp defaults-from sasp
```

Creates a monitor named my\_sasp that inherits properties from the default SASP monitor.

```
list sasp
```

Displays the properties of all of the SASP monitors.

## OPTIONS

**app-service**

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

**defaults-from**

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is sasp.

**description**

User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**interval**

Specifies the frequency at which the system issues the monitor check. The default value is auto.

**mode** Specifies whether the load balancer should send Get Weight Request messages (pull) or receive Send Weights messages (push) from the GWM. The default mode is pull.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**

Displays the administrative partition within which the component resides.

**primary-address**

Specifies the IP address of the primary Group Workload Manager.

**protocol**

Specifies the protocol that the monitor uses to communicate with the target. The default value is tcp.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**secondary-address**

Specifies the IP address of the secondary Group Workload Manager.

**service**

Specifies the port through which the SASP monitor communicates with the Group Workload Manager. The default port is 3860.

**time-until-up**

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 100 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

## SEE ALSO

## ltm monitor scripted

**NAME**  
scripted - Configures a Scripted monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the scripted component within the ltm monitor module using the syntax in the following sections.

**CREATE/MODIFY**  
create scripted [name]  
modify scripted [name]  
options:  
  app-service [[string] | none]  
  debug [no | yes]  
  defaults-from [name]  
  description [string]  
  destination [ip address] [port]  
  filename [ [filename] | none]  
  interval [integer]  
  manual-resume [enabled | disabled]  
  time-until-up [integer]  
  timeout [integer]  
  up-interval [integer]

edit scripted [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list scripted  
list scripted [ [ [name] | [glob] | [regex] ] ... ]  
show scripted [ [ [name] | [glob] | [regex] ] ... ]  
show running-config scripted  
show running-config scripted [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition

**DELETE**  
delete scripted [name]

Note: You cannot delete default monitors.

**DESCRIPTION**  
You can use the scripted component to configure a custom monitor, or you can use the default scripted monitor that the Local Traffic Manager provides.

**EXAMPLES**  
create scripted my\_scripted defaults-from scripted

Creates a monitor named my\_scripted that inherits properties from the default scripted monitor.

list scripted

Displays the properties of all of the scripted monitors.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

debug  
Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks.

The default value is no. The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

defaults-from  
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is scripted.

description  
User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

\*:\* Specifies to perform a health check on the IP address and port supplied by a pool member.

\*:port  
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port  
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

filename  
Specifies the name of a file in the /config/eav/ directory on the system. The user-created file contains the send and expect data that the monitor uses for the monitor check. The default value is none.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

interval  
Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 10 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

manual-resume  
Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition  
Displays the administrative partition within which the component resides.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

time-until-up  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

timeout  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

up-interval  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

## ltm monitor sip

**NAME**  
sip - Configures a Session Initiation Protocol (SIP) monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the sip component within the ltm monitor module using the syntax in the following sections.

**CREATE/MODIFY**  
create sip [name]  
modify sip [name]  
options:  
  app-service [[string] | none]  
  cert [ [cert list] | none]  
  cipherlist [string]  
  compatibility [enabled | disabled]  
  debug [ no | yes]  
  defaults-from [name]  
  description [string]  
  destination [ip address][port]  
  filter [any | none | status]  
  filter-neg [any | none | status]  
  headers [ [new line separated headers] | none]  
  interval [integer]  
  key [ [key] | none]  
  manual-resume [enabled | disabled]  
  mode [sips | tcp | tls | udp]  
  request [none | [string] ]  
  time-until-up [integer]  
  up-interval [integer]  
  username [ [name] | none]

edit sip [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list sip  
list sip [ [ [name] | [glob] | [regex] ] ... ]  
show sip [ [ [name] | [glob] | [regex] ] ... ]  
show running-config sip  
show running-config sip [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition

**DELETE**  
delete sip [name]

Note: You cannot delete default monitors.

**DESCRIPTION**  
You can use the sip component to configure a custom monitor, or you can use the default SIP monitor that the Local Traffic Manager provides. This type of monitor checks the status of SIP Call-ID services on a device. The SIP protocol enables real-time messaging, voice, data, and video.

**EXAMPLES**  
create sip my\_sip defaults-from sip  
  
Creates a monitor named my\_sip that inherits properties from the default SIP monitor.  
  
list sip  
  
Displays the properties of all of the SIP monitors.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.  
  
cert Specifies a fully-qualified path for a client certificate that the monitor sends to the target SSL server. The default value is none.  
  
cipherlist  
Specifies the list of ciphers for this monitor. The default value is DEFAULT:+SHA:+3DES:+KEDH.  
  
compatibility  
Specifies, when enabled, that the SSL options setting (in OpenSSL) is set to ALL. The default value is enabled.  
  
debug  
Specifies whether the monitor sends error messages and additional

information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks.

The default value is no. The options are:

**no** Specifies that the system does not redirect error messages and additional information related to this monitor.

**yes** Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

**defaults-from**  
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is sip.

**description**  
User defined description.

**destination**  
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

**\*.\*** Specifies to perform a health check on the IP address and port supplied by a pool member.

**\*:port**  
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

**IP address:port**  
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

**filter**  
Specifies the SIP status codes that the target can return to be considered up. By default the system always accepts status codes whose value is in the 100, 200 or 300s.

The options are:

**any** Specifies that the monitor accepts any SIP status codes.

**none** Specifies that the monitor does not accept any other SIP status codes. This is the default value.

**status**  
Specifies one or more status codes that you want to add to the monitor.

**filter-neg**  
Specifies the SIP status codes that the target can return to be considered down. By default the system always accepts status codes according to sip-monitor.filter. After checking that, the status code is checked against this key. If a code is also in sip-monitor.filter, the node is marked up.

The options are:

**any** Specifies that the monitor rejects all SIP status codes that are not in sip-monitor.filter.

**none** Specifies that the monitor does not specifically reject any other SIP status codes. This is the default value.

**status**  
Specifies one or more status codes that you want to add to the monitor.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**headers**  
Specifies the set of SIP headers in the SIP message that is sent to the target. Separate each header with a new line. The default value is none.

**interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 5 seconds.

**Important:** F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**key** Specifies the key if the monitored target requires authentication. The default value is none.

**manual-resume**  
Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

**mode** Specifies the protocol that the monitor uses to communicate with

the target. The default mode is udp. The options are:

**sips** Specifies that the monitor uses SIPS to communicate with the target.

**tcp** Specifies that the monitor uses TCP to communicate with the target.

**tls** Specifies that the monitor uses TLS to communicate with the target, and the SIP URI is SIPS.

**udp** Specifies that the monitor uses UDP to communicate with the target.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**request**  
Specifies the SIP request line in the SIP message that is sent to the target. The default value is none.

**time-until-up**  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is

**timeout**  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

**up-interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

## ltm monitor smb

NAME

smb - Configures a Server Message Bloc (SMB)/Common Internet File System (CIFS) monitor.

MODULE

ltm monitor

SYNTAX

Configure the smb component within the ltm monitor module using the syntax in the following sections.

CREATE/MODIFY

create smb [name]

modify smb [name]

options:

app-service [[string] | none]

```

debug [no | yes]
defaults-from [name]
description [string]
destination [ip address][port]
get [none | [filename] ]
interval [integer]
manual-resume [enabled | disabled]
password [none | [password] ]
server [ [NETBIOS name] | none]
service [ [[name] | [integer]] | none]
time-until-up [integer]
timeout [integer]
up-interval [integer]
username [ [name] | none]

edit smb [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list smb
list smb [ [ [name] | [glob] | [regex] ] ... ]
show smb [ [ [name] | [glob] | [regex] ] ... ]
show running-config smb
show running-config smb [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete smb [name]

```

Note: You cannot delete default monitors.

#### DESCRIPTION

You can use the smb component to configure a custom monitor, or you can use the default SMB monitor that the Local Traffic Manager provides. This type of monitor verifies the availability of an SMB/CIFS server. You can use this type of monitor to either check the availability of the server as a whole, the availability of a specific service on the server, or the availability of a specific file used by a service.

#### EXAMPLES

```
create smb my_smb defaults-from smb
```

Creates a monitor named my\_smb that inherits properties from the default SMB monitor.

```
list smb
```

Displays the properties of all of the SMB monitors.

#### OPTIONS

**app-service**

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

**debug**

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

**no** Specifies that the system does not redirect error messages and additional information related to this monitor.

**yes** Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

**defaults-from**

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is smb.

**description**

User defined description.

**destination**

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

**\*.\*** Specifies to perform a health check on the IP address and port supplied by a pool member.

**\*:port**

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

**IP address:port**

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

**get** Specifies a file associated with a service. The default value is

none.

The monitor uses the relative path to the service itself when attempting to locate the file. You are not required to specify a value for this option; however, if you elect to use this option you must also specify a value for the service option.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 10 seconds.

**Important:** F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**manual-resume**  
Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the component resides.

**password**  
Specifies the password if the monitored target requires authentication. The default value is none.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**server**  
Specifies the NetBIOS name of the SMB/CIFS server for which this monitor checks for availability. You must specify a server for this monitor to function. The default value is none.

**service**  
Specifies a specific service on the SMB/CIFS for which you want to verify availability. The default value is none.

**time-until-up**  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

**up-interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

**Important:** F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**username**  
Specifies the user name if the monitored target requires authentication. The default value is none.

## ltm monitor smtp

**NAME**  
smtp - Configures a Simple Mail Transport Protocol (SMTP) monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the smtp component within the ltm monitor module using the syntax in the following sections.

**CREATE/MODIFY**  
create smtp [name]  
modify smtp [name]  
options:  
  app-service [[string] | none]  
  debug [no | yes]  
  defaults-from [name]  
  description [string]  
  destination [ip address][port]  
  domain [ [name] | none]  
  interval [integer]  
  manual-resume [enabled | disabled]  
  time-until-up [integer]  
  timeout [integer]  
  up-interval [integer]

edit smtp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list smtp  
list smtp [ [ [name] | [glob] | [regex] ] ... ]  
show smtp [ [ [name] | [glob] | [regex] ] ... ]  
show running-config smtp  
show running-config smtp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition

**DELETE**  
delete smtp [name]

Note: You cannot delete default monitors.

**DESCRIPTION**  
You can use the smtp component to configure a custom monitor, or you can use the default SMTP monitor that the Local Traffic Manager provides. This type of monitor checks the status of a pool, pool member, or virtual server by issuing standard SMTP commands.

**EXAMPLES**  
create smtp my\_smtp defaults-from smtp

Creates a monitor named my\_smtp that inherits properties from the default SMTP monitor.

list smtp

Displays the properties of all of the SMTP monitors.

**OPTIONS**

**app-service**  
Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

**debug**  
Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

**no** Specifies that the system does not redirect error messages and additional information related to this monitor.

**yes** Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

**defaults-from**  
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is smtp.

description  
User defined description.

destination  
Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

\*:\* Specifies to perform a health check on the IP address and port supplied by a pool member.

\*:port  
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port  
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

domain  
Specifies the domain name to check, for example, bigipinternal.com. The default value is none.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

interval  
Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 5 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

manual-resume  
Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition  
Displays the administrative partition within which the component resides.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

time-until-up  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

timeout  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

up-interval  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

## ltm monitor snmp-dca-base

**NAME**  
snmp-dca-base - Configures a base Simple Network Management Protocol (SNMP) Data Center Audit monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the snmp-dca-base component within the ltm monitor module using the syntax in the following sections.

### CREATE/MODIFY

```
create snmp-dca-base [name]
modify snmp-dca-base [name]
  options:
    app-service [[string] | none]
    community [ [name] | none]
    cpu-coefficient [ [integer] | none]
    defaults-from [name]
    description [string]
    interval [integer]
    time-until-up [integer]
    timeout [integer]
    user-defined [ [name] [value] | [name] none ]
    version [ [integer] | none]

edit snmp-dca-base [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
```

### DISPLAY

```
list snmp-dca-base
list snmp-dca-base [ [ [name] | [glob] | [regex] ] ... ]
show snmp-dca-base [ [ [name] | [glob] | [regex] ] ... ]
show running-config snmp-dca-base
show running-config snmp-dca-base [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition
```

### DELETE

```
delete snmp-dca-base [name]
```

Note: You cannot delete default monitors.

### DESCRIPTION

You can use the snmp-dca-base component to configure a custom monitor, or you can use the default base SNMP DCA monitor that the Local Traffic Manager provides. This type of monitor checks the performance of a server running an SNMP agent such as UC Davis. Use this monitor only when you want the load balancing destination to be based solely on user data, and not CPU, memory or disk use.

### EXAMPLES

```
create snmp-dca-base my_snmp-dca-base defaults-from snmp_dca_base
```

Creates a monitor named my\_snmp-dca-base that inherits properties from the default base SNMP DCA monitor.

```
list snmp-dca-base
```

Displays the properties of all of the base SNMP DCA monitors.

### OPTIONS

#### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

#### community

Specifies the community name that the BIG-IP system must use to authenticate with the host server through SNMP. The default value is public.

#### defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is snmp\_dca\_base.

#### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### interval

Specifies the frequency at which the system issues the monitor

check. The default value is 10 seconds.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**time-until-up**  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 30 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

**user-defined**  
Specifies any user-defined command-line arguments and variables that the external program requires. Use the following syntax to specify a user defined parameter.

```
modify external my_external user-defined my_param_name  
my_param_value
```

Use the following syntax to remove a user defined parameter.

```
modify external my_external user-defined my_param_name none
```

**version**  
Specifies the version of SNMP that the host server uses. The default value is none.

#### SEE ALSO

create, delete, edit, glob, list, modify, regex, show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## ltm monitor snmp-dca

**NAME**  
snmp-dca - Configures a Simple Network Management Protocol (SNMP) Data Center Audit monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the snmp component within the ltm monitor module using the syntax in the following sections.

```
CREATE/MODIFY  
create snmp-dca [name]  
modify snmp-dca [name]  
options:  
agent-type [generic | other | win2000 | ucd]  
app-service [[string] | none]  
community [ [name] | none]  
cpu-coefficient [ [integer] | none]  
cpu-threshold [none | [integer] ]  
defaults-from [name]  
description [string]  
disk-coefficient [ [integer] | none]  
disk-threshold [none | [integer] ]  
interval [integer]  
memory-coefficient [ [integer] | none]  
memory-threshold [none | [integer] ]
```

```

time-until-up [integer]
timeout [integer]
user-defined
version [ [integer] | none]

edit snmp-dca [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list snmp-dca
list snmp-dca [ [ [name] | [glob] | [regex] ] ... ]
show snmp-dca [ [ [name] | [glob] | [regex] ] ... ]
show running-config snmp-dca
show running-config snmp-dca [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete snmp-dca [name]

```

Note: You cannot delete default monitors.

#### DESCRIPTION

You can use the snmp-dca component to configure a custom monitor, or you can use the default SNMP DCA monitor that the Local Traffic Manager provides. This type of monitor checks the performance of a server running an SNMP agent such as UC Davis, for the purpose of load balancing traffic to that server.

#### EXAMPLES

```
create snmp-dca my_snmp-dca defaults-from snmp_dca
```

Creates a monitor named my\_snmp-dca that inherits properties from the default SNMP DCA monitor.

```
list snmp-dca
```

Displays the properties of all of the SNMP DCA monitors.

#### OPTIONS

**agent-type**  
Specifies the type of agent. The default value is ucd.

**app-service**  
Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

**community**  
Specifies the community name that the BIG-IP system must use to authenticate with the host server through SNMP. The default value is public.

**cpu-coefficient**  
Specifies the coefficient that the system uses to calculate the weight of the CPU threshold in the dynamic ratio load balancing algorithm. The default value is 1.5.

**cpu-threshold**  
Specifies the maximum acceptable CPU usage on the target server. The default value is 80 percent.

**defaults-from**  
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is snmp\_dca.

**description**  
User defined description.

**disk-coefficient**  
Specifies the coefficient that the system uses to calculate the weight of the disk threshold in the dynamic ratio load balancing algorithm. The default value is 2.0.

**disk-threshold**  
Specifies the maximum acceptable disk usage on the target server. The default value is 90 percent.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**interval**  
Specifies the frequency at which the system issues the monitor check. The default value is 10 seconds.

**memory-coefficient**  
Specifies the coefficient that the system uses to calculate the weight of the memory threshold in the dynamic ratio load balancing algorithm. The default value is 1.0.

**memory-threshold**  
Specifies the maximum acceptable memory usage on the target server. The default value is 70 percent.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**time-until-up**  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 30 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

**user-defined**  
Specifies attributes for a monitor that you define. The default value is none.

**version**  
Specifies the version of SNMP that the host server uses. The default value is none.

## ltm monitor soap

**NAME**  
soap - Configures a Simple Object Access Protocol (SOAP) monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the soap component within the ltm monitor module using the syntax in the following sections.

**CREATE/MODIFY**  
create soap [name]  
modify soap [name]  
options:  
app-service [[string] | none]  
debug [no | yes]  
defaults-from [name]  
description [string]  
destination [ip address][port]  
expect-fault [no | yes]  
interval [integer]  
manual-resume [enabled | disabled]  
method [string]  
namespace [ [name] | none]  
parameter-name [ [name] | none]  
parameter-type [bool | int | long | string ]  
parameter-value [none | [integer] | [string] ]  
password [none | [password] ]  
protocol [http | https]  
return-type [bool | char | double | int | long | short | string]  
return-value [none | [integer] | [string] ]  
soap-action [string]  
time-until-up [integer]  
timeout [integer]  
up-interval [integer]  
url-path [none | [string] ]  
username [[name] | none]  
  
edit soap [ [ [name] | [glob] | [regex] ] ... ]  
options:

all-properties  
non-default-properties

#### DISPLAY

list soap  
list soap [ [ [name] | [glob] | [regex] ] ... ]  
show soap [ [ [name] | [glob] | [regex] ] ... ]  
show running-config soap  
show running-config soap [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

#### DELETE

delete soap [name]

Note: You cannot delete default monitors.

#### DESCRIPTION

You can use the soap component to configure a custom monitor, or you can use the default SOAP monitor that the Local Traffic Manager provides. This type of monitor tests a Web service based on SOAP.

#### EXAMPLES

create soap my\_soap defaults-from soap

Creates a soap monitor that inherits values from the system default SOAP monitor.

list soap

Displays the properties of all of the SOAP monitors.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

##### debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

no Specifies that the system does not redirect error messages and additional information related to this monitor.

yes Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

##### defaults-from

Specifies the type of monitor you want to use to create the new monitor. The default value is soap.

##### description

User defined description.

##### destination

Specifies the IP address and service port of the resource that is the destination of this monitor. Possible values are:

\*:\* Specifies to perform a health check on the IP address and port supplied by a pool member.

##### \*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

##### IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

##### expect-fault

Specifies whether the value of the method option causes the monitor to expect a SOAP fault message. The default value is no.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 5 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

##### manual-resume

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must

manually mark the resource as up before the system can use it for load balancing connections.

method

Specifies the method by which the monitor contacts the resource.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

namespace

Specifies the name space for the Web service you are monitoring, for example, http://example.com/. The default value is none.

parameter-name

If the method has a parameter, specifies the name of that parameter. The default value is none.

parameter-type

Specifies the parameter type. The default value is bool.

parameter-value

Specifies the value for the parameter. The default value is none.

partition

Displays the administrative partition within which the component resides.

password

Specifies the password if the monitored target requires authentication. The default value is none.

protocol

Specifies the protocol that the monitor uses to communicate with the target, http or https. The default value is http.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

return-type

Specifies the type for the returned parameter. The default value is bool.

return-value

Specifies the value for the returned parameter. The default value is none.

soap-action

Specifies the value for the SOAPAction header. The default value is the empty string.

time-until-up

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds. If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

url-path

Specifies the URL for the Web service that you are monitoring, for example, /services/mybservice.aspx. The default value is none.

up-interval

Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

username

Specifies the user name if the monitored target requires authentication. The default value is none.

SEE ALSO

create, delete, edit, glob, list, modify, regex, show, tmsh

## ltm monitor tcp-echo

**NAME**  
tcp-echo - Configures a Transmission Control Protocol (TCP) Echo monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the tcp-echo component within the ltm monitor module using the syntax in the following sections.

**CREATE/MODIFY**  
create tcp-echo [name]  
modify tcp-echo [name]  
options:  
adaptive [enabled | disabled]  
adaptive-divergence-type [relative | absolute]  
adaptive-divergence-value [integer]  
adaptive-limit [integer]  
adaptive-sampling-timespan [integer]  
app-service [[string] | none]  
defaults-from [name]  
description [string]  
destination [ip address]  
interval [integer]  
manual-resume [enabled | disabled]  
time-until-up [integer]  
timeout [integer]  
transparent [disabled | enabled]  
up-interval [integer]

edit tcp-echo [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list tcp  
list tcp [ [ [name] | [glob] | [regex] ] ... ]  
show tcp [ [ [name] | [glob] | [regex] ] ... ]  
show running-config tcp-echo  
show running-config tcp-echo [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

**DELETE**  
delete tcp-echo [name]

Note: You cannot delete default monitors.

**DESCRIPTION**  
You can use the tcp-echo component to configure a custom monitor, or you can use the default TCP Echo monitor that the Local Traffic Manager provides. This type of monitor checks the status of a resource, using TCP Echo.

**EXAMPLES**  
create tcp-echo my\_tcp-echo defaults-from tcp\_echo  
  
Creates a monitor named my\_tcp-echo that inherits properties from the default TCP Echo monitor.  
  
list tcp-echo  
  
Displays the properties of all of the TCP Echo monitors.

**OPTIONS**  
adaptive  
Specifies whether the adaptive feature is enabled for this monitor. Not all monitors support the adaptive feature.  
  
adaptive-divergence-type  
Specifies whether the adaptive-divergence-value is relative or absolute.  
  
adaptive-divergence-value  
Specifies how far from mean latency each monitor probe is allowed to be. If adaptive-divergence-type is relative, this value is a percentage deviation from mean (e.g. 50 would indicate the probe is allowed to exceed the mean latency by 50%.) If adaptive-divergence-type is absolute, this value is an offset from mean in milliseconds (e.g. 250 would indicate the probe is allowed to exceed the mean latency by 250 ms.) A probe that exceeds latency is counted the same as a probe that is not received, so in the typical scenario, it will require three missed latencies in a row to mark a pool member or node down (i.e. a 15-second interval with a 46-second timeout, would require three missed probes before the pool member or node would be marked down.)

#### adaptive-limit

Specifies the hard limit, in milliseconds, which the probe is not allowed to exceed, regardless of the divergence value. For example, if this value is 500, then the probe latency may not exceed 500 ms even if that would still fall within the divergence value.

#### adaptive-sampling-timespan

Specifies the size of the sliding window, in seconds, which records probe history. For example, if this value is 300, then a sliding window of the last five minutes' probe history will be used for calculating probe mean latency and standard deviation.

#### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

#### defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is tcp\_echo.

#### description

User defined description.

#### destination

Specifies the IP address of the resource that is the destination of this monitor. The default value is \*.

Possible values are:

\* Specifies to perform a health check on the IP address of the node.

#### IP address

Specifies to perform a health check on the IP address that you specify, and mark the associated node up or down accordingly.

#### IP address (with the transparent option enabled)

Specifies to perform a health check on the IP address that you specify, route the check through the IP address of the associated node, and mark the IP address of the associated node up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 5 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

#### manual-resume

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### partition

Displays the administrative partition within which the component resides.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### time-until-up

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

#### timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

#### transparent

Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

**up-interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

SEE ALSO

## ltm monitor tcp-half-open

NAME

tcp-half-open - Configures a Transmission Control Protocol (TCP) Half Open monitor.

MODULE

ltm monitor

SYNTAX

Configure the tcp-half-open component within the ltm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create tcp-half-open [name]
modify tcp-half-open [name]
options:
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  destination [ip address][port]
  interval [integer]
  manual-resume [enabled | disabled]
  time-until-up [integer]
  timeout [integer]
  transparent [disabled | enabled]
  up-interval [integer]
```

```
edit tcp-half-open [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list tcp-half-open
list tcp-half-open [ [name] | [glob] | [regex] ] ... ]
show tcp-half-open [ [name] | [glob] | [regex] ] ... ]
show running-config tcp-half-open
show running-config tcp-half-open [ [name] | [glob] |
  [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete tcp-half-open [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the tcp-half-open component to configure a custom monitor, or you can use the default TCP Half Open monitor that the Local Traffic Manager provides.

For more information about configuring monitors, refer to the Configuration Guide for BIG-IP(r) Local Traffic Manager(r).

EXAMPLES

```
create tcp-half-open my_tcp-half-open defaults-from tcp_half_open
```

Creates a monitor named my\_tcp-half-open that inherits properties from the default TCP Half Open monitor.

list tcp-half-open

Displays the properties of all of the TCP Half Open monitors.

#### OPTIONS

app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is tcp\_half\_open.

description

User defined description.

destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

\*:\* Specifies to perform a health check on the IP address and port supplied by a pool member.

\*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

IP address:port (with the transparent option enabled)

Specifies to perform a health check on the server at the IP address and port you specify, route the check through the IP address and port supplied by the pool member, and mark the pool member (the gateway) up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 5 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

manual-resume

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

time-until-up

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

transparent

Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

up-interval

Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

## ltm monitor tcp

NAME

tcp - Configures a Transmission Control Protocol (TCP) monitor.

MODULE

ltm monitor

SYNTAX

Configure the tcp component within the ltm monitor module using the syntax in the following sections.

CREATE/MODIFY

```
create tcp [name]
modify tcp [name]
options:
  adaptive [enabled | disabled]
  adaptive-divergence-type [relative | absolute]
  adaptive-divergence-value [integer]
  adaptive-limit [integer]
  adaptive-sampling-timespan [integer]
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  destination [ip address][port]
  interval [integer]
  ip-dscp [integer]
  manual-resume [enabled | disabled]
  recv [none | [string] ]
  recv-disable [none | [string] ]
  reverse [enabled | disabled]
  send [none | [string] ]
  time-until-up [integer]
  timeout [integer]
  transparent [disabled | enabled]
  up-interval [integer]
```

```
edit tcp [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list tcp
list tcp [ [name] | [glob] | [regex] ] ... ]
show tcp [ [name] | [glob] | [regex] ] ... ]
show running-config tcp
show running-config tcp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete tcp [name]
```

Note: You cannot delete default monitors.

DESCRIPTION

You can use the tcp component to configure a custom monitor, or you can use the default TCP monitor that the Local Traffic Manager provides.

EXAMPLES

```
create tcp my_tcp defaults-from tcp
```

Creates a monitor named my\_tcp that inherits properties from the default TCP monitor.

```
list tcp
```

Displays the properties of all of the TCP monitors.

#### OPTIONS

##### adaptive

Specifies whether the adaptive feature is enabled for this monitor. Not all monitors support the adaptive feature.

##### adaptive-divergence-type

Specifies whether the adaptive-divergence-value is relative or absolute.

##### adaptive-divergence-value

Specifies how far from mean latency each monitor probe is allowed to be. If adaptive-divergence-type is relative, this value is a percentage deviation from mean (e.g. 50 would indicate the probe is allowed to exceed the mean latency by 50%.) If adaptive-divergence-type is absolute, this value is an offset from mean in milliseconds (e.g. 250 would indicate the probe is allowed to exceed the mean latency by 250 ms.) A probe that exceeds latency is counted the same as a probe that is not received, so in the typical scenario, it will require three missed latencies in a row to mark a pool member or node down (i.e. a 15-second interval with a 46-second timeout, would require three missed probes before the pool member or node would be marked down.)

##### adaptive-limit

Specifies the hard limit, in milliseconds, which the probe is not allowed to exceed, regardless of the divergence value. For example, if this value is 500, then the probe latency may not exceed 500 ms even if that would still fall within the divergence value.

##### adaptive-sampling-timespan

Specifies the size of the sliding window, in seconds, which records probe history. For example, if this value is 300, then a sliding window of the last five minutes' probe history will be used for calculating probe mean latency and standard deviation.

##### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

##### defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is tcp.

##### description

User defined description.

##### destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

\*:\* Specifies to perform a health check on the IP address and port supplied by a pool member.

##### \*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

##### IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

##### IP address:port (with the transparent option enabled)

Specifies to perform a health check on the server at the IP address and port you specify, route the check through the IP address and port supplied by the pool member, and mark the pool member (the gateway) up or down accordingly.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 5 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

##### ip-dscp

Specifies the differentiated services code point (DSCP). DSCP is a 6-bit value in the Differentiated Services (DS) field of the IP header. It can be used to specify the quality of service desired for the packet. The valid range for this value is 0 to 63 (hex 0x0 to 0x3f). The default value is zero.

##### manual-resume

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for

load balancing connections.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`  
Displays the administrative partition within which the component resides.

`recv` Specifies the text string that the monitor looks for in the returned resource. The default value is none.

The most common receive expressions contain a text string that is included in an HTML file on your site. The text string can be regular text, HTML tags, or image names. If you do not specify a value for both the `send` and `recv` options, the monitor performs a simple service check and connect only.

`recv-disable`  
Specifies a text string that the monitor looks for in the returned resource. If the text string is matched in the returned resource, the corresponding node or pool member is marked session disabled. The default value is none.

You specify a `recv-disable` string in the same way that you specify a `recv` string.

If you specify a `recv-disable` string, you must also specify a `recv` string. You cannot specify a `recv-disable` string, if the `reverse` option is enabled.

`regex`  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

`reverse`  
Specifies whether the monitor operates in reverse mode. When the monitor is in reverse mode, a successful check marks the monitored object down instead of up. You can use this mode only if you configure both the `send` and `recv` options.

The default value is disabled, which specifies that the monitor does not operate in reverse mode. The enabled value specifies that the monitor operates in reverse mode.

`send` Specifies the text string that the monitor sends to the target object. The default setting is `GET /`, which retrieves a default HTML file for a web site.

To retrieve a specific page from a web site, specify a fully-qualified path name, for example, `GET /www/company/index.html`. Since the string may have special characters, the system may require that the string be enclosed with single quotation marks.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the `recv` option and ignores the option even if not null.

`time-until-up`  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

`timeout`  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

`transparent`  
Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

`up-interval`  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

## ltm monitor udp

**NAME**  
udp - Configures a User Datagram Protocol (UDP) monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the udp component within the ltm monitor module using the syntax in the following sections.

**CREATE/MODIFY**  
create udp [name]  
modify udp [name]  
options:  
adaptive [enabled | disabled]  
adaptive-divergence-type [relative | absolute]  
adaptive-divergence-value [integer]  
adaptive-limit [integer]  
adaptive-sampling-timespan [integer]  
app-service [[string] | none]  
debug [no | yes]  
defaults-from [name]  
description [string]  
destination [ip address][port]  
interval [integer]  
manual-resume [enabled | disabled]  
recv [none | [string] ]  
recv-disable [none | [string] ]  
reverse [enabled | disabled]  
send [none | [string] ]  
time-until-up [integer]  
timeout [integer]  
transparent [disabled | enabled]  
up-interval [integer]

edit udp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list udp  
list udp [ [ [name] | [glob] | [regex] ] ... ]  
show udp [ [ [name] | [glob] | [regex] ] ... ]  
show running-config udp  
show running-config udp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

**DELETE**  
delete udp [name]

Note: You cannot delete default monitors.

**DESCRIPTION**  
You can use the udp component to configure a custom monitor, or you can use the default UDP monitor that the Local Traffic Manager provides. This type of monitor verifies the UDP service by attempting to send UDP packets to a pool, pool member, or virtual server and receiving a reply.

**EXAMPLES**  
create udp my\_udp defaults-from udp  
  
Creates a monitor named my\_udp that inherits properties from the default UDP monitor.  
  
list udp  
  
Displays the properties of all of the UDP monitors.

**OPTIONS**  
adaptive  
Specifies whether the adaptive feature is enabled for this monitor. Not all monitors support the adaptive feature.  
  
adaptive-divergence-type  
Specifies whether the adaptive-divergence-value is relative or absolute.  
  
adaptive-divergence-value  
Specifies how far from mean latency each monitor probe is allowed to be. If adaptive-divergence-type is relative, this value is a

percentage deviation from mean (e.g. 50 would indicate the probe is allowed to exceed the mean latency by 50%.) If adaptive-divergence-type is absolute, this value is an offset from mean in milliseconds (e.g. 250 would indicate the probe is allowed to exceed the mean latency by 250 ms.) A probe that exceeds latency is counted the same as a probe that is not received, so in the typical scenario, it will require three missed latencies in a row to mark a pool member or node down (i.e. a 15-second interval with a 46-second timeout, would require three missed probes before the pool member or node would be marked down.)

#### adaptive-limit

Specifies the hard limit, in milliseconds, which the probe is not allowed to exceed, regardless of the divergence value. For example, if this value is 500, then the probe latency may not exceed 500 ms even if that would still fall within the divergence value.

#### adaptive-sampling-timespan

Specifies the size of the sliding window, in seconds, which records probe history. For example, if this value is 300, then a sliding window of the last five minutes' probe history will be used for calculating probe mean latency and standard deviation.

#### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

#### debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

**no** Specifies that the system does not redirect error messages and additional information related to this monitor.

**yes** Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

#### defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is udp.

#### description

User defined description.

#### destination

Specifies the IP address and service port of the resource that is the destination of this monitor. Possible values are:

**\*:\*** Specifies to perform a health check on the IP address and port supplied by a pool member.

#### \*:port

Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

#### IP address:port

Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

#### IP address:port (with the transparent option enabled)

Specifies to perform a health check on the server at the IP address and port you specify, route the check through the IP address and port supplied by the pool member, and mark the pool member (the gateway) up or down accordingly.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 5 seconds.

**Important:** F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

#### manual-resume

Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### partition

Displays the administrative partition within which the component resides.

recv Specifies the text string that the monitor looks for in the returned resource. The default value is none.

#### recv-disable

Specifies a text string that the monitor looks for in the returned resource. If the text string is matched in the returned resource, the corresponding node or pool member is marked session disabled. The default value is none.

The recv-disable string may be specified the same way a recv string may be specified.

If the recv-disable string is configured, the recv string must be non-empty. The recv-disable string may not be configured if reverse mode is enabled.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### reverse

Specifies whether the monitor operates in reverse mode. When the monitor is in reverse mode, a successful check marks the monitored object down instead of up. You can use the this mode only if you configure both the send and recv options.

The default value is disabled, which specifies that the monitor does not operate in reverse mode. The enabled value specifies that the monitor operates in reverse mode.

send Specifies the text string that the monitor sends to the target object. The default value is GET /, which retrieves a default HTML file for a web site.

To retrieve a specific page from a web site, specify a fully-qualified path name, for example, GET /www/company/index.html. Since the string may have special characters, the system may require that the string be enclosed with single quotation marks.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if it is not null. The default value is none.

#### time-until-up

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

#### timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds. If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

#### transparent

Specifies whether the monitor operates in transparent mode. Monitors in transparent mode can monitor pool members through firewalls. The default value is disabled.

#### up-interval

Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**NAME**  
virtual-location - Configures a Virtual Location monitor.

**MODULE**  
ltm monitor

**SYNTAX**  
Configure the virtual-location component within the ltm monitor module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create virtual-location [name]  
modify virtual-location [name]  
options:  
  app-service [[string] | none]  
  debug [no | yes]  
  defaults-from [name]  
  description [string]  
  interval [integer]  
  pool [name]  
  time-until-up [integer]  
  timeout [integer]  
  up-interval [integer]

edit virtual-location [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list virtual-location  
list virtual-location [ [ [name] | [glob] | [regex] ] ... ]  
show virtual-location [ [ [name] | [glob] | [regex] ] ... ]  
show running-config virtual-location  
show running-config virtual-location  
  [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition

**DELETE**  
delete virtual-location [name]

Note: You cannot delete default monitors.

**DESCRIPTION**  
The Virtual Location monitor will determine if a pool member which has a virtual IP is currently a local pool member with its arp entry existing on a local VLAN, or, a remote pool member with its ARP entry existing on a tunnel VLAN. If the pool member is local it will set the pool member's priority to 2. If the pool member is remote it will set the priority to 1 (a lower priority). The Virtual Location will always return up as the availability for the pool member. It is necessary to use an additional monitor to check the availability status of the pool member.

You can use the virtual-location component to configure a custom monitor, or you can use the default Virtual Location monitor that the Local Traffic Manager provides.

**EXAMPLES**  
create virtual-location my\_virtual-location defaults-from  
virtual\_location pool aPool

Creates a monitor named my\_virtual-location that inherits properties from the default Virtual Location monitor.

list virtual-location

Displays the properties of all of the Virtual Location monitors.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

debug  
Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. The default setting is no. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The options are no (specifies that the system does not redirect error messages and additional information related to this monitor.) and yes (specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.)

defaults-from  
Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is virtual\_location.

description  
User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### interval

Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 5 seconds.

Important: F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### partition

Displays the administrative partition within which the component resides.

pool Specifies the pool for the target pool member. This is a required argument.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### time-until-up

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

#### timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

#### up-interval

Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

#### SEE ALSO

## ltm monitor wap

#### NAME

wap - Configures a Wireless Application Protocol (WAP) monitor.

#### MODULE

ltm monitor

#### SYNTAX

Configure the wap component within the ltm monitor module using the syntax in the following sections.

#### CREATE/MODIFY

create wap [name]

modify wap [name]

#### options:

accounting-node [none | [RADIUS server name] ]

accounting-port [[integer] | none]

app-service [[string] | none]

call-id [none | [RADIUS server 11 digit phone number] ]

debug [no | yes]

defaults-from [name]

```

description [string]
destination [ip address][port]
framed-address [none | [RADIUS framed IP address] ]
interval [integer]
manual-resume [enabled | disabled]
recv [none | [string] ]
secret [none | [password] ]
send [none | [string]]
server-id [none | [RADIUS NAS-ID] ]
session-id [none | [RADIUS session ID] ]
time-until-up [integer]
timeout [integer]
up-interval [integer]

edit wap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list wap
list wap[ [ [name] | [glob] | [regex] ] ... ]
show wap[ [ [name] | [glob] | [regex] ] ... ]
show running-config wap
show running-config wap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete wap [name]

```

Note: You cannot delete default monitors.

#### DESCRIPTION

You can use the wap component to configure a custom monitor, or you can use the default WAP monitor that the Local Traffic Manager provides. This type of monitor requests the URL specified in the send option, and finds the string specified in the recv option somewhere in the data returned by the URL response.

#### EXAMPLES

```
create wap my_wap defaults-from wap
```

Creates a monitor named my\_wap that inherits properties from the default WAP monitor.

```
list wap
```

Displays the properties of all of the WAP monitors.

#### OPTIONS

##### accounting-node

Specifies the RADIUS server that provides authentication for the WAP target. Note that if you configure the accounting-port option, but you do not configure the this option, the system assumes that the RADIUS server and the WAP server are the same system.

##### accounting-port

Specifies the port that the monitor uses for RADIUS accounting. The default value is none. A value of 0 (zero) disables RADIUS accounting.

##### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

##### call-id

Specifies the 11-digit phone number for the RADIUS server. The default value is none.

##### debug

Specifies whether the monitor sends error messages and additional information to a log file created and labeled specifically for this monitor. You can use the log information to help diagnose and troubleshoot unsuccessful health checks. The default value is no.

The options are:

**no** Specifies that the system does not redirect error messages and additional information related to this monitor.

**yes** Specifies that the system redirects error messages and additional information to the /var/log/monitors/--.log file.

##### defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is wap.

##### description

User defined description.

##### destination

Specifies the IP address and service port of the resource that is the destination of this monitor. The default value is \*.\*.

Possible values are:

**\*:\*** Specifies to perform a health check on the IP address and port supplied by a pool member.

**\*:port**  
Specifies to perform a health check on the server with the IP address supplied by the pool member and the port you specify.

**IP address:port**  
Specifies to mark a pool member up or down based on the response of the server at the IP address and port you specify.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**framed-address**  
Specifies the RADIUS framed IP address. The default value is none.

**interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when either the resource is down or the status of the resource is unknown. The default value is 10 seconds.

**Important:** F5 Networks recommends that when you configure this option and the up-interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

**manual-resume**  
Specifies whether the system automatically changes the status of a resource to up at the next successful monitor check. The default value of the manual-resume option is disabled.

Note that if you set the manual-resume option to enabled, you must manually mark the resource as up before the system can use it for load balancing connections.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the component resides.

**recv** Specifies the text string that the monitor looks for in the returned resource. The most common receive expressions contain a text string that is included in an HTML file on your site. The text string can be regular text, HTML tags, or image names. If you do not specify both a value for both the send and recv options, the monitor performs a simple service check and connect only. The default value is none.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**secret**  
Specifies the password the monitor needs to access the resource. The default value is none.

**send** Specifies the text string that the monitor sends to the target object. The default setting is GET /, which retrieves a default HTML file for a web site.

To retrieve a specific page from a web site, specify a fully-qualified path name, for example, GET /www/company/index.html. Since the string may have special characters, the system may require that the string be enclosed with single quotation marks.

If this value is null, then a valid connection suffices to determine that the service is up. In this case, the system does not need the recv option and ignores the option even if it is not null. The default value is none.

**server-id**  
Specifies the RADIUS NAS-ID for this system when configuring a RADIUS server. The default value is none.

**session-id**  
Specifies the RADIUS session identification number when configuring a RADIUS server. The default value is none.

**time-until-up**  
Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

**timeout**  
Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 31 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

**up-interval**  
Specifies, in seconds, the frequency at which the system issues the monitor check when the resource is up. The default value is 0 (zero), which specifies that the system uses the value of the

interval option whether the resource is up or down.

Important: F5 Networks recommends that when you configure this option and the interval option, whichever value is greater be a multiple of the lesser value to allow for an even distribution of monitor checks among all monitors.

## ltm monitor wmi

NAME

wmi - Configures a Windows Management Infrastructure (WMI) monitor.

MODULE

ltm monitor

SYNTAX

Configure the wmi component within the ltm monitor module using the syntax in the following sections.

CREATE/MODIFY

create wmi [name]

modify wmi [name]

options:

agent [string]

app-service [[string] | none]

command [ [command] | none ]

defaults-from [name]

description [string]

interval [integer]

metrics [ [value] | none]

password [none | [password] ]

time-until-up [integer]

timeout [integer]

url [none | [URL] ]

username [ [name] | none]

edit wmi [ [ [name] | [glob] | [regex] ] ... ]

options:

all-properties

non-default-properties

DISPLAY

list wmi

list wmi [ [ [name] | [glob] | [regex] ] ... ]

show wmi [ [ [name] | [glob] | [regex] ] ... ]

show running-config wmi

show running-config wmi [ [ [name] | [glob] | [regex] ] ... ]

options:

agent

all-properties

method

non-default-properties

one-line

partition

post

DELETE

delete wmi [name]

Note: You cannot delete default monitors.

DESCRIPTION

You can use the wmi component to configure a custom monitor, or you can use the default WMI monitor that the Local Traffic Manager provides. This type of monitor checks the performance of a pool, pool member, or virtual server that is running the WMI data collection agent, and then dynamically load balances traffic accordingly.

EXAMPLES

```
create wmi my_wmi defaults-from wmi
```

Creates a monitor named my\_wmi that inherits properties from the default WMI monitor.

```
list wmi
```

Displays the properties of all of the WMI monitors.

#### OPTIONS

##### agent

Displays the agent for the monitor. The default agent is Mozilla/4.0 (compatible: MSIE 5.0; Windows NT).

##### app-service

Specifies the name of the application service to which the monitor belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the monitor. Only the application service can modify or delete the monitor.

##### command

Specifies the command that the system uses to obtain the metrics from the resource. See the documentation for this resource for information on available commands.

##### defaults-from

Specifies the name of the monitor from which you want your custom monitor to inherit settings. The default value is wmi.

##### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### interval

Specifies the frequency at which the system issues the monitor check. The default value is 5 seconds.

##### method

Displays the GET method. You cannot modify the method.

##### metrics

Specifies the performance metrics that the commands collect from the target. The default value is LoadPercentage, DiskUsage, PhysicalMemoryUsage:1.5, VirtualMemoryUsage:2.0.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

##### partition

Displays the administrative partition within which the component resides.

##### password

Specifies the password if the monitored target requires authentication. The default value is none.

##### post

Specifies the mechanism that the monitor uses for posting. The default value is RespFormat=HTML.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

##### time-until-up

Specifies the amount of time, in seconds, after the first successful response before a node is marked up. A value of 0 (zero) causes a node to be marked up immediately after a valid response is received from the node. The default value is 0 (zero).

##### timeout

Specifies the number of seconds the target has in which to respond to the monitor request. The default value is 16 seconds.

If the target responds within the set time period, it is considered up. If the target does not respond within the set time period, it is considered down. Also, if the target responds with a RESET packet, the system immediately flags the target as down without waiting for the timeout interval to expire.

url Specifies the URL that the monitor uses. The default value is /scripts/f5Isapi.dll.

##### username

Specifies the user name if the monitored target requires authentication. The default value is none.

#### SEE ALSO

create, delete, edit, glob, list, modify, regex, show, tmsh

#### COPYRIGHT

## ltm nat

**NAME**  
nat - Configures network address translation (NAT) for the Local Traffic Manager.

**MODULE**  
ltm

**SYNTAX**  
Configure the nat component within the ltm module using the syntax in the following sections.

**CREATE/MODIFY**  
create nat [name]  
modify nat [name]  
options:  
  app-service [[string] | none]  
  arp  
  auto-lasthop [default | enabled | disabled ]  
  description [string]  
  [enabled | disabled]  
  originating-address [ip address]  
  translation-address [ip address]  
  traffic-group [[string] | default | non-default | none]  
  vlans [enabled | disabled]  
  vlans-disabled  
  vlans-enabled  
reset-stats nat  
reset-stats nat [ [ [name] | [glob] | [regex] ] ... ]

edit nat [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list nat  
list nat [ [ [name] | [glob] | [regex] ] ... ]  
show running-config nat  
show running-config nat [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition

show nat  
show nat [name]  
options:  
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
  field-fmt

**DELETE**  
delete nat [name]

**DESCRIPTION**  
A network address translation (NAT) defines a mapping between an originating IP address and an IP address that you specify.

A primary reason for defining a NAT is to allow one of the servers in the server array behind the traffic management system to start communication with a computer in front of, or external to, the system.

**EXAMPLES**  
create nat new\_nat translation-address 10.0.140.100 originating-address 11.0.0.100

The node behind the system with the IP address 10.0.140.100 has a presence in front of the BIG-IP(r) System as IP address 11.0.0.100.

delete nat new\_nat

Permanently deletes the NAT from the system configuration.

**Additional Restrictions**  
The nat component has the following additional restrictions:

- o A virtual server cannot use the IP address specified in the NAT.
- o A NAT should not use an IP address of a BIG-IP system.
- o A NAT cannot use an originating or translated IP address defined for and used by a SNAT or another NAT.
- o You must delete a NAT before you can redefine it.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the NAT belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the NAT. Only the application service can modify or delete the NAT.

arp Enables or disables Address Resolution Protocol (ARP).

description  
User defined description.

[enabled | disabled]  
Enables or disables the NAT. The default value is enabled.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

inherited-traffic-group  
Indicates if the traffic-group is inherited from the parent folder. This property is read only.

originating-address  
Specifies the IP address from which traffic is being initiated.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

traffic-group  
Specifies the traffic group of the failover device group on which the NAT is active. The default traffic group is inherited from the containing folder.

translation-address  
Specifies the IP address that is translated or mapped, and the IP address to which it is translated or mapped. This option is required when creating a NAT. This option may not be changed after the nat has been created.

unit Specifies the unit in a redundant system. Derived from traffic-group. This property is read only.

vlan  
Specifies a list of existing VLANs on which access to the NAT is enabled or disabled. A NAT is accessible on all VLANs by default.

vlan-disabled  
Indicates the NAT is disabled on the list of VLANs.

vlan-enabled  
Indicates the NAT is enabled on the list of VLANs.

#### SEE ALSO

## ltm node

NAME  
node - Configures node addresses and services.

MODULE  
ltm

SYNTAX  
Configure the node component within the ltm module using the syntax in the following sections.

```
CREATE/MODIFY
create node [name]
modify node [name]
options:
  address [ip address]
  app-service [[string] | none]
  connection-limit [integer]
  description [string]
  [down | up]
  dynamic-ratio [integer]
  fqdn {
  name [string]
  address-family [ipv4 | ipv6]
  autopopulate [enabled | disabled]
  down-interval [integer]
  interval [integer]
  }
  logging [enabled | disabled]
```

```

monitor [ [name] | none]
rate-limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
state [user-down | user-up]
metadata
  [add | delete | modify] {
[metadata_name ... ] {
  value [ "value content" ]
  persist [ true | false ]
}
}

reset-stats node
reset-stats node [ [ [ip address] | [glob] | [regex] ] ... ]

edit node [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

mv node [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]] ]
options:
  to-folder

DISPLAY
list node
list node [ [ [name] | [glob] | [regex] ] ... ]
show running-config node
show running-config node [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
show node
show node [name]
options:
  all-properties
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt

DELETE
delete node [name]

```

#### DESCRIPTION

Displays information about nodes, and sets attributes of nodes and node IP addresses.

#### EXAMPLES

```
list node all-properties
```

Displays all of the properties of all of the nodes.

```
modify node all monitor none
```

Removes all monitor associations from nodes.

```
create node myNode address 10.10.10.15
```

Creates a node named myNode with an IP address of 10.10.10.15.

```
modify node myNode monitor none
```

Removes all monitor associations from the node, myNode.

```
show node
```

Displays statistics and status for all nodes in the system configuration.

```
show node all-properties
```

Displays statistics and status for all nodes in the system configuration. If the system includes Packet Velocity(r) ASIC (PVA) and PVA Assist capabilities, this command displays status and statistics for that feature.

```
mv /ltm node /Common/10.10.10.15 to-folder /Common/all_nodes
```

Moves the node 10.10.10.15 to a folder named all\_nodes, where all\_nodes has already been created under /Common.

Note: If you wish to change the name of the node, you must use the nodes same IP Address or a name that does not represent an IP Address that does not match the address configured on the node.

Please refer to the mv manual page for additional examples on how to use the mv command.

#### OPTIONS

address

Specifies the IP address of the node.

app-service

Specifies the name of the application service to which the node belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the node. Only the application service can modify or delete the node.

connection-limit

Specifies the maximum number of connections that a node or node address can handle. The default value is 0 (zero).

**description**  
Specifies a user-defined description.

**[down | up]**  
Marks the node up or down. The default value is down.

**dynamic ratio**  
Sets the dynamic ratio number for the node. The ratio weights are based on continuous monitoring of the servers and are therefore continually changing. The default value is 1.

Dynamic Ratio load balancing can currently be implemented on RealNetworks RealServer platforms, on Windows platforms equipped with Windows Management Instrumentation (WMI), or on a server equipped with either the UC Davis SNMP agent or Windows 2000 Server SNMP agent.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**metadata**  
Associates user defined data, each of which has a name and value pair and persistence. The default value is persistent, which saves the data to the config file.

**fqdn** Specifies the attributes for defining a fully qualified domain name for the node.

**name** Specifies the fully-qualified domain name of the node.

**address-family**  
Specifies whether the fqdn should consider IPv4, IPv6, or IP-agnostic address family.

**autopopulate**  
Specifies whether a node defined by a fully-qualified domain name should automatically scale to the set of IP addresses returned by the DNS query. If disabled, only one ephemeral node is generated from the first IP address returned by DNS. The default is disabled.

**interval**  
Specifies the interval to instantiate DNS queries on a fully-qualified domain name. The default is the TTL.

**down-interval**  
Specifies the interval for the domain name resolution operation when a DNS query fails.

**logging**  
Specifies whether the monitor applied should log its actions. Logs are stored in /var/log/monitors/ and are regularly rotated and compressed. The default value is disabled. This option isn't a part of configuration and will reset to disabled on load. This option doesn't sync.

**monitor**  
Specifies the name of the monitor that you want to associate with the node. The default value is none.

**partition**  
Displays the administrative partition in which the node object resides.

**rate-limit**  
Specifies the maximum number of connections per second allowed for a node or node address. The default value is 'disabled'.

**ratio**  
Specifies the fixed ratio value used for a node during Ratio load balancing. The default value is 1.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**session**  
Establishing a session with a node is establishing the ability of the client to persist to the node when making new connections. When a node is session disabled, clients that have already established sessions with the node may create new connections, but a client that has not already established a session may not create a new one (or make a connection which would create a new session). This feature is used to gently drain connections from a node, typically as part of a maintenance operation. The default value is user-enabled.

**state**  
Specifies the current state of the node. Use user-down to indicate that the node may not handle any new connections. Use user-up, after using user-down, to indicate that the node may accept new connections.

**to-folder**  
This is used with the mv command to specify a folder in which to move the node to.

Note: nodes can be moved to any folder under /Common, but dependencies upon it may restrict moving it out of /Common.

create, delete, edit, glob, list, ltm pool, modify, mv, regex, reset-  
stats, show, tmsh

show running-config cookie [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  non-default-properties
  one-line
  partition
```

#### DELETE

```
delete cookie [name]
options:
  all
```

#### DESCRIPTION

You can use the cookie component to configure cookie persistence for the BIG-IP(r) system. Cookie persistence uses an HTTP cookie stored on a client's computer to allow the client to connect to the same server previously visited at a web site.

A persistence profile is a profile that enables persistence when you assign the profile to a virtual server. Using a persistence profile avoids having to write an iRule to implement a type of persistence. You can either use the default profile, or create a custom profile based on the default.

## EXAMPLES

list cookie

Displays all cookie persistence profiles.

create cookie cookie\_persistence defaults-from cookie

Creates a custom cookie persistence profile named `cookie_persistence` that inherits its settings from the default cookie persistence profile.

mv cookie /Common/my\_cookie\_profile to-folder /Common/my\_folder

Moves a custom cookie persistence profile named `my_cookie_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

## OPTIONS

always-send

Send the cookie persistence entry on every reply, even if the entry has previously been supplied to the client. The default value is disabled.

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

cookie-name

Specifies a unique name for the cookie. This option is required.

defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is `cookie`, the system default cookie persistence profile.

description

User defined description.

cookie-encryption

Specifies the way in which cookie format will be used: `disabled`: generate old format, `unencrypted`, preferred: generate encrypted cookie but accept both encrypted and old format, and `required`: cookie format must be encrypted. Default is `required`.

cookie-encryption-passphrase

Specifies a passphrase to be used for cookie encryption.

expiration

Specifies the cookie expiration date in the format `d:h:m:s`, `h:m:s`, `m:s` or seconds. (hours 0-23, minutes 0-59, seconds 0-59). The time period must be less than 24856 days.

You can use "session-cookie" (0 seconds) to indicate that the cookie expires when the browser closes.

`glob` Displays the items that match the `glob` expression. See help `glob` for a description of `glob` expression syntax.

httponly

Specifies whether the `httponly` attribute should be enabled or disabled for the inserted cookies. The default value is enabled.

secure

Specifies whether the `secure` attribute should be enabled or disabled for the inserted cookies. The default value is enabled.

hash-length

Specifies the cookie hash length. The length is the number of bytes to use when calculating the hash value. The default value is 0 (zero) bytes.

hash-offset

Specifies the cookie hash offset. The offset is the number of bytes in the cookie to skip before calculating the hash value. The default value is 0 (zero) bytes.

match-across-pools

Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is disabled.

match-across-services

Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is disabled.

match-across-virtuals

Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is disabled.

method

Specifies the type of cookie processing that the system uses. The default value is `insert`.

mirror

Specifies whether the system mirrors persistence records to the high-availability peer. This option is applicable only when the value of the `method` option is `hash`. The default value is disabled.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

**override-connection-limit**  
Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is disabled.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**timeout**  
Specifies the duration of the persistence entries. The default value is 180 seconds.

**to-folder**  
cookie persistence profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

## ltm persistence dest-addr

NAME

dest-addr - Configures a destination address affinity persistence profile.

MODULE

ltm persistence

SYNTAX

Configure the dest-addr component within the ltm persistence module using the syntax in the following sections.

MODIFY

```
create dest-addr [name]
modify dest-addr [name]
options:
  all
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  hash-algorithm [carp | default]
  mask [ [ip address] | none]
  match-across-pools [ enabled | disabled]
  match-across-services [enabled | disabled]
  match-across-virtuals [enabled | disabled]
  mirror [enabled | disabled]
  override-connection-limit [enabled | disabled]
  timeout [integer]
```

```
edit dest-addr [ [name] | [glob] | [regex] ] ... ]
```

```
options:
  all-properties
  non-default-properties
```

```
mv dest-addr [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]] ]
```

```
options:
  to-folder
```

DISPLAY

```
list dest-addr
list dest-addr [ [name] | [glob] | [regex] ] ... ]
show running-config dest-addr

  partition
```

DELETE  
delete dest-addr [name]  
options:  
all

#### DESCRIPTION

You can use the dest-addr component to configure a destination address affinity persistence profile for the BIG-IP(r) system. Also known as sticky persistence, destination address affinity persistence supports TCP and UDP protocols, and directs session requests to the same server based solely on the destination IP address of a packet.

A persistence profile is a profile that enables persistence when you assign the profile to a virtual server. Using a persistence profile means that you do not have to write an iRule to implement a type of persistence. You can either use the default profile, or create a custom profile based on the default.

#### EXAMPLES

```
list dest-addr
```

Displays all destination address affinity persistence profiles.

```
create dest-addr da_persistence defaults-from dest-addr
```

Creates a custom destination address affinity persistence profile named da\_persistence that inherits its settings from the default destination address affinity persistence profile.

```
mv dest-addr /Common/my_dest-addr_profile to-folder /Common/my_folder
```

Moves a custom destination address persistence profile named my\_dest-addr\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is dest\_addr, the system default destination address affinity persistence profile.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

hash-algorithm

Specifies the system uses hash persistence load balancing. The default value is default (no hash persistence).

The options are:

carp Specifies to use the Cache Array Routing Protocol (CARP) to select the pool member for LB. The input to CARP is the hash value of destination address.

default

no hash persistence.

mask Specifies an IP mask. This is the mask used by simple persistence for connections. The default value is ::.

match-across-pools

Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is disabled.

match-across-services

Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is disabled.

match-across-virtuals

Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is disabled.

mirror

Specifies whether the system mirrors persistence records to the high-availability peer. The default value is disabled.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

override-connection-limit

Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is disabled.

partition

Displays the administrative partition within which the component resides.

regex

Displays the items that match the regular expression. The regular

expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**timeout**  
Specifies the duration of the persistence entries. The default value is 180 seconds.

**to-folder**  
dest-addr persistence profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

## ltm persistence global-settings

NAME

global-settings - Configures persistence for the BIG-IP(r) system.

MODULE

ltm persistence

SYNTAX

Configure the global-settings component within the ltm persistence module using the syntax in the following sections.

MODIFY

modify global-settings [option name]

options:

description [string]  
dest-addr-limit-mode [timeout | maxcount]  
dest-addr-max [integer]  
proxy-group [string]

edit global-settings [ [ [name] | [glob] | [regex] ] ... ]

options:

all-properties  
non-default-properties

DISPLAY

list global-settings

list global-settings [ [ [name] | [glob] | [regex] ] ... ]

show running-config global-settings

show running-config global-settings

[ [ [name] | [glob] | [regex] ] ... ]

options:

all-properties  
non-default-properties  
one-line

DESCRIPTION

You can use the global-settings component within the ltm persistence module to configure persistence for the system.

For information about configuring session persistence for a virtual server, see the man pages for the following components: ltm persistence hash, ltm persistence msrdp, ltm persistence sip, ltm persistence source-addr, ltm persistence ssl, and ltm persistence universal.

EXAMPLES

list global-settings

Displays the global persistence configuration.

modify global-settings dest-addr-limit-mode maxcount

Sets the value of the option dest-addr-limit-mode to maxcount, which indicates that a persistence session is limited by the maximum number of requests to the destination address.

OPTIONS

description

User defined description.

dest-addr-limit-mode

Specifies that a persistence session is limited by either the

number of seconds before the persistence entry times out, or by a maximum number of requests to the destination address. The default value is timeout.

**dest-addr-max**

Specifies the maximum number of entries that the persistence table can contain at any one time, when the value of the option dest-addr-limit-mode is maxcount. The default value is 2048 entries.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**proxy-group**

Specifies a group of servers that are configured to process all of the requests from a single source address during a persistence session. The default value is aol.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**

list, ltm virtual, modify, regex, show, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

**DISPLAY**

list hash

list hash [ [ [name] | [glob] | [regex] ] ... ]

show running-config hash

show running-config hash [ [ [name] | [glob] | [regex] ] ... ]

options:

all

all-properties

non-default-properties

one-line

partition

```
DELETE
delete hash [name]
options:
  all
```

#### DESCRIPTION

You can use the hash component to configure a hash persistence profile for the BIG-IP(r) system. Hash persistence can also be activated from an existing iRule.

A persistence profile is a profile that enables persistence when you assign the profile to a virtual server. Using a persistence profile means that you do not have to write an iRule to implement a type of persistence. You can either use the default profile, or create a custom profile based on the default.

#### EXAMPLES

```
list hash
```

Displays all hash persistence profiles.

```
create hash hash_persistence defaults-from hash
```

Creates a custom hash persistence profile named hash\_persistence that inherits its settings from the default hash persistence profile.

```
mv hash /Common/my_hash_profile to-folder /Common/my_folder
```

Moves a custom hash persistence profile named my\_hash\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

**app-service**

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

**defaults-from**

Specifies the existing profile from which the system imports settings for the new profile. The default value is hash, the system default cookie persistence profile.

**description**

User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**hash-algorithm**

Specifies the algorithm the system uses for hash persistence load balancing. The default value is default.

The options are:

**carp** Specifies to use the Cache Array Routing Protocol (CARP) to select the pool member for LB.

**default**

Specifies to use indexing of pool members to select the pool member for LB.

**hash-buffer-limit**

Specifies the maximum buffer length the system collects to locate the hashing pattern for hash persistence load balancing. The default value is 0 (zero).

**hash-end-pattern**

Specifies the string that describes the ending location of the hash pattern that the system uses to perform hash persistence load balancing. The default value is none.

**hash-length**

Specifies the length of data within the packet in bytes that the system uses to calculate the hash value when performing hash persistence load balancing. The default value is 0 (zero) bytes.

**hash-offset**

Specifies the start offset within the packet from which the system begins the hash when performing hash persistence load balancing. The default value is 0 (zero).

**hash-start-pattern**

Specifies the string that describes the start location of the hash pattern that the system uses to perform hash persistence load balancing. The default value is none.

**match-across-pools**

Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is disabled.

**match-across-services**

Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is disabled.

**match-across-virtuals**

Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is disabled.

**mirror**  
Specifies whether the system mirrors persistence records to the high-availability peer. The default value is disabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**override-connection-limit**  
Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is disabled.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**rule** Specifies a rule name, if you are using a rule for universal persistence.

**timeout**  
Specifies the duration of the persistence entries. The default value is 180 seconds.

**to-folder**  
hash persistence profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**SEE ALSO**

create, delete, edit, glob, list, ltm virtual, modify, mv, regex, show, tmsh

## ltm persistence host

**NAME**  
host - Configures a host persistence profile.

**MODULE**  
ltm persistence

**SYNTAX**  
Configure the host component within the ltm persistence module using the syntax in the following sections.

**MODIFY**  
create host [name]  
modify host [name]  
options:  
all  
app-service [[string] | none]  
defaults-from [name]  
description [string]  
match-across-pools [enabled | disabled]  
match-across-services [enabled | disabled]  
match-across-virtuals [enabled | disabled]  
mirror [enabled | disabled]  
override-connection-limit [enabled | disabled]  
timeout [integer]

edit host [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

mv host [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]] ]  
options:  
to-folder

**DISPLAY**  
list host  
list host [ [ [name] | [glob] | [regex] ] ... ]

```
show running-config host
show running-config host [name]
options:
  all
  all-properties
  non-default-properties
  one-line
  partition
```

```
DELETE
delete host [name]
options:
  all
```

#### DESCRIPTION

You can use the host component to configure a host persistence profile for the BIG-IP(r) system. Host persistence uses the HTTP Host header passed in a HTTP request to determine which pool member to pick. Host persistence can also be activated from an existing iRule.

A persistence profile is a profile that enables persistence when you assign the profile to a virtual server. Using a persistence profile means that you do not have to write an iRule to implement a type of persistence. You can either use the default profile, or create a custom profile based on the default.

#### EXAMPLES

```
list host
```

Displays all host persistence profiles.

```
create host host_persistence defaults-from host
```

Creates a custom host persistence profile named host\_persistence that inherits its settings from the default host persistence profile.

```
mv host /Common/my_host_profile to-folder /Common/my_folder
```

Moves a custom host persistence profile named my\_host\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

**app-service**

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

**defaults-from**

Specifies the existing profile from which the system imports settings for the new profile. The default value is host, the system default host persistence profile.

**description**

User defined description.

**match-across-pools**

Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is disabled.

**match-across-services**

Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is disabled.

**match-across-virtuals**

Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is disabled.

**mirror**

Specifies whether the system mirrors persistence records to the high-availability peer. The default value is disabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**override-connection-limit**

Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is disabled.

**partition**

Displays the administrative partition within which the component resides.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**timeout**

Specifies the duration of the persistence entries. The default value is 180 seconds.

**to-folder**

host persistence profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

## ltm persistence msrdp

NAME  
msrdp - Configures a Microsoft(r) Remote Display Protocol (MSRDP)  
persistence profile.

MODULE  
ltm persistence

SYNTAX  
Configure the msrdp component within the ltm persistence module using  
the syntax in the following sections.

### MODIFY

```
create msrdp [name]
modify msrdp [name]
options:
  all
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  has-session-dir [no | yes]
  match-across-pools [enabled | disabled]
  match-across-services [enabled | disabled]
  match-across-virtuals [enabled | disabled]
  mirror [enabled | disabled]
  override-connection-limit [enabled | disabled]
  timeout [integer]
```

```
edit msrdp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
mv msrdp [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-na
options:
  to-folder
```

### DISPLAY

```
list msrdp
list msrdp [ [name] | [glob] | [regex] ] ... ]
show running-config msrdp
show running-config msrdp [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  non-default-properties
  one-line
  partition
```

### DELETE

```
delete msrdp [name]
options:
  all
```

### DESCRIPTION

You can use the msrdp component to configure an MSRDP persistence  
profile for the BIG-IP(r) system. MSRDP persistence provides an  
efficient way of load balancing traffic and maintaining persistent  
sessions between Windows clients and servers that are running the  
Microsoft Terminal Services service. The recommended scenario for  
enabling the MSRDP persistence feature is to create a load balancing  
pool that consists of members running Windows .NET Server 2003,  
Enterprise Edition, or later, where all members belong to a Windows  
cluster and participate in a Windows session directory.

A persistence profile is a profile that enables persistence when you  
assign the profile to a virtual server. Using a persistence profile  
means that you do not have write an iRule to implement a type of  
persistence. You can either use the default profile, or create a custom  
profile based on the default.

### EXAMPLES

```
list msrdp
```

Displays all MSRDP persistence profiles.

```
create msrdp msrdp_persistence defaults-from msrdp
```

Creates a custom MSRDP persistence profile named `msrdp_persistence` that inherits its settings from the default MSRDP persistence profile

```
mv msrdp /Common/my_msrdp_profile to-folder /Common/my_folder
```

Moves a custom MSRDP persistence profile named `my_msrdp_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

##### defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is `msrdp`, the system default cookie persistence profile.

##### description

User defined description.

`glob` Displays the items that match the `glob` expression. See help `glob` for a description of `glob` expression syntax.

##### has-session-dir

Specifies whether the Microsoft terminal services are configured with a session directory, so the system does not load balance the initial connection. The default value is `yes`.

##### match-across-pools

Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is `disabled`.

##### match-across-services

Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is `disabled`.

##### match-across-virtuals

Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is `disabled`.

##### mirror

Specifies whether the system mirrors persistence records to the high-availability peer. The default value is `disabled`.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

##### override-connection-limit

Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is `disabled`.

##### partition

Displays the administrative partition within which the component resides.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an `@` sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

##### timeout

Specifies the duration of the persistence entries. The default value is 300 seconds.

##### to-folder

`msrdp` persistence profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm virtual`, `modify`, `mv`, `regex`, `show`, `tmsh`

#### COPYRIGHT

## ltm persistence persist-records

**NAME**  
persist-records - Displays or deletes persistence records.

**MODULE**  
ltm persistence

**SYNTAX**  
Configure the persist-records component within the ltm persistence module using the syntax in the following sections.

**DISPLAY**  
show persist-records  
options:  
client-addr [ip address]  
key [string]  
mode [cookie | destination-address | hash | msrdp | sip | source-address | ssl-session-id | universal]  
node-addr [ip address]  
node-port [integer]  
pool [string]  
save-to-file [ filename ]  
virtual [string]

**DELETE**  
delete persist-records  
options:  
client-addr [ip address]  
key [string]  
mode [cookie | destination-address | hash | msrdp | sip | source-address | ssl-session-id | universal]  
node-addr [ip address]  
node-port [integer]  
pool [string]  
virtual [string]

**DESCRIPTION**  
You can use the persist-records component to either display or delete records of persistent connections.

**EXAMPLES**  
show persist-records  
Displays all persistent connections on the BIG-IP(r) system.  
delete persist-records client-addr 172.19.255.1  
Deletes all persistent connections that originate from the client IP address, 172.19.255.1.

**OPTIONS**  
client-addr  
Specifies the IP address of the client from which the persistent connections you want to view or delete persist.  
key Specifies a string that the system is using to persist the connections you want to view or delete.  
mode Specifies the type of persistence of the connections you want to view or delete. The options are:  
cookie  
Cookie persistence uses an HTTP cookie stored on a client's computer to allow the client to connect to the same server previously visited at a web site.  
destination-address  
Also known as sticky persistence, destination address affinity persistence supports TCP and UDP protocols, and directs session requests to the same server based solely on the destination IP address of a packet.  
hash Hash persistence is based on an existing iRule.  
msrdp  
MSRDP persistence provides an efficient way of load balancing traffic and maintaining persistent sessions between Windows(r) clients and servers that are running the Microsoft(r) Terminal Services service. The recommended scenario for enabling the MSRDP persistence feature is to create a load balancing pool that consists of members running Windows .NET Server 2003, Enterprise Edition, or later, where all members belong to a Windows cluster and participate in a Windows session directory.  
sip Session Initiation Protocol (SIP) persistence is a type of persistence available for server pools. You can configure SIP persistence for proxy servers that receive SIP messages sent through UDP. The BIG-IP system currently supports persistence for SIP messages sent through UDP, TCP, or SCTP.  
source-address  
Also known as simple persistence, source address affinity persistence supports TCP and UDP protocols, and directs session requests to the same server based solely on the source IP address of a packet. When you specify a source address as the mode of persistence, you must specify an IP

address using the client-addr option.

**ssl-session-id**  
SSL persistence is a type of persistence that tracks non-terminated SSL sessions, using the SSL session ID. Even when the client's IP address changes, the system still recognizes the connection as being persistent based on the session ID. Note that the term, non-terminated SSL sessions, refers to sessions in which the system does not perform the tasks of SSL certificate authentication and encryption/re-encryption.

**universal**  
Universal persistence allows you to write an expression that defines what to persist on in a packet. The expression, written using the same expression syntax that you use in `iRules(r)`, defines some sequence of bytes to use as a session identifier.

**node-addr**  
Specifies the IP address of the node with which the client sessions that you want to view or delete remain persistent.

**node-port**  
Specifies the port number of the node with which the client sessions that you want to view or delete remain persistent.

**pool** Specifies the pool member with which the client sessions that you want to view or delete remain persistent.

**save-to-file**  
Specifies the file which persist-records information can be save to. With this option, it can write a file larger than 2GB.

**virtual**  
Specifies the virtual server with which the client sessions that you want to view or delete remain persistent.

  one-line
  partition

DELETE
delete sip [name]
options:
  all
```

#### DESCRIPTION

You can use the sip component to configure a SIP persistence profile for the BIG-IP(r) system. SIP persistence is a type of persistence available for server pools. You can configure SIP persistence for proxy servers that receive SIP messages sent through UDP. The BIG-IP system currently supports persistence for SIP messages sent through UDP, TCP, or SCTP.

A persistence profile is a profile that enables persistence when you assign the profile to a virtual server. Using a persistence profile means that you do not have to write an iRule to implement a type of persistence. You can either use the default profile, or create a custom profile based on the default.

#### EXAMPLES

```
list sip

Displays all SIP persistence profiles.

create sip sip_persistence defaults-from sip_info

Creates a custom SIP persistence profile named sip_persistence that inherits its settings from the default SIP persistence profile.

mv sip /Common/my_sip_profile to-folder /Common/my_folder

Moves a custom SIP persistence profile named my_sip_profile to a folder named my_folder, where my_folder has already been created and exists within /Common.
```

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

**defaults-from**  
Specifies the existing profile from which the system imports settings for the new profile. The default value is sip\_info, the system default cookie persistence profile.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**match-across-pools**  
Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is disabled.

**match-across-services**  
Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is disabled.

**match-across-virtuals**  
Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is disabled.

**mirror**  
Specifies whether the system mirrors persistence records to the high-availability peer. The default value is disabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**override-connection-limit**  
Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is disabled.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**sip-info**  
Specifies the SIP header field on which you want SIP sessions to

persist. The default value is none.

**timeout**  
Specifies the duration of the persistence entries. The default value is 180 seconds.

**to-folder**  
sip persistence profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

partition

DELETE

delete source-addr [name]

options:

all

DESCRIPTION

You can use the source-addr component to configure a source address affinity persistence profile for the BIG-IP(r) system. Also known as simple persistence, source address affinity persistence supports TCP and UDP protocols, and directs session requests to the same server based solely on the source IP address of a packet.

A persistence profile is a profile that enables persistence when you assign the profile to a virtual server. Using a persistence profile means that you do not have to write an iRule to implement a type of persistence. You can either use the default profile, or create a custom profile based on the default.

#### EXAMPLES

```
list source-addr
```

Displays all source address affinity persistence profiles.

```
create source-addr simple_persistence defaults-from source_addr
```

Creates a custom source address affinity persistence profile named `simple_persistence` that inherits its settings from the default source address affinity persistence profile.

```
mv source-addr /Common/my_source-addr_profile to-folder  
/Common/my_folder
```

Moves a custom source address persistence profile named `my_source-addr_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

#### OPTIONS

```
app-service
```

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

```
defaults-from
```

Specifies the existing profile from which the system imports settings for the new profile. The default value is `source_addr`, the system default cookie persistence profile.

```
description
```

User defined description.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

```
hash-algorithm
```

Specifies the system uses hash persistence load balancing. The default value is `default` (no hash persistence).

The options are:

`carp` Specifies to use the Cache Array Routing Protocol (CARP) to select the pool member for LB. The input to CARP is the hash value of source address.

```
default
```

no hash persistence.

```
map-proxies
```

Enables or disables the map proxies attribute. The default value is disabled.

This attribute controls whether a source address will first be checked against an IP data-group/class to determine whether it is a well-known proxy address. If it matches the IP class, then the source address will be mapped to a single IP address for the purposes of persistence. The default well known proxy class is based on a pre-defined data-group "aol" which represents the AOL(r) company's previously-published list of proxies. Using this feature enables you to use client/source IP address persistence with a simple persist mask, but forces all clients matching the IP class to persist to the same server. The IP data-group/class may also be changed using either the `map-proxy-class` profile attribute or globally by changing the DB variable `Persist.WellKnownProxyClass`. Also, the IP address used for mapping a single source IP address for persistence may also be specifically set using the `map-proxy-address` profile attribute.

```
map-proxy-address
```

Specifies the single IP address to use when the source address matches the proxy data-group/class. The default value is any which results in the default behavior of using one of the IP addresses from the proxy data-group/class. Note: This mapped IP address does not have to be contained in the IP data-group/class. It may actually be any IP address since it is only used for keying the persistence record.

```
map-proxy-class
```

Specifies the data-group/class to use for determining whether a source address is from a proxy. The default value is none which will result in map proxies using the class defined by the DB variable `Persist.WellKnownProxyClass`.

`mask` Specifies an IP mask. This is the mask used by simple persistence for connections. The default value is `::`.

```
match-across-pools
```

Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is disabled.

```
match-across-services
```

Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is disabled.

**match-across-virtuals**  
 Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is disabled.

**mirror**  
 Specifies whether the system mirrors persistence records to the high-availability peer. The default value is disabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**override-connection-limit**  
 Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is disabled.

**partition**  
 Displays the administrative partition within which the component resides.

**regex**  
 Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**timeout**  
 Specifies the duration of the persistence entries. The default value is 180 seconds.

**to-folder**  
 source-addr persistence profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

## ltm persistence ssl

NAME

ssl - Configures a Secure Socket Layer (SSL) persistence profile.

MODULE

ltm persistence

SYNTAX

Configure the ssl component within the ltm persistence module using the syntax in the following sections.

MODIFY

```
create ssl [name]
modify ssl [name]
options:
  all
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  match-across-pools [ enabled | disabled]
  match-across-services [enabled | disabled]
  match-across-virtuals [enabled | disabled]
  mirror [enabled | disabled]
  override-connection-limit [enabled | disabled]
  timeout [integer]
```

```
edit ssl [ [ [name] | [glob] | [regex] ] ... ]
options:
```

```
  all-properties
  non-default-properties
```

```
mv ssl [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name] ]
options:
  to-folder
```

DISPLAY

```
list ssl
```

```
list ssl [ [name] | [glob] | [regex] ] ... ]
show running-config ssl
show running-config ssl [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete ssl [name]
options:
  all
```

#### DESCRIPTION

You can use the ssl component to configure a destination address affinity persistence profile for the BIG-IP(r) system. SSL persistence is a type of persistence that tracks non-terminated SSL sessions, using the SSL session ID. Even when the client's IP address changes, the system still recognizes the connection as being persistent based on the session ID. Note that the term, non-terminated SSL sessions, refers to sessions in which the system does not perform the tasks of SSL certificate authentication and encryption/re-encryption.

A persistence profile is a profile that enables persistence when you assign the profile to a virtual server. Using a persistence profile means that you do not have to write an iRule to implement a type of persistence. You can either use the default profile, or create a custom profile based on the default.

#### EXAMPLES

```
list ssl
```

Displays all SSL persistence profiles.

```
create ssl ssl_persistence defaults-from ssl
```

Creates a custom SSL persistence profile named ssl\_persistence that inherits its settings from the default SSL persistence profile.

```
mv ssl /Common/my_ssl_profile to-folder /Common/my_folder
```

Moves a custom SSL persistence profile named my\_ssl\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is ssl, the system default cookie persistence profile.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

match-across-pools

Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is disabled.

match-across-services

Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is disabled.

match-across-virtuals

Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is disabled.

mirror

Specifies whether the system mirrors persistence records to the high-availability peer. The default value is disabled.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

override-connection-limit

Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is disabled.

partition

Displays the administrative partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

timeout

Specifies the duration of the persistence entries. The default value is 300 seconds.

to-folder  
ssl persistence profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

## ltm persistence universal

NAME

universal - Configures a universal persistence profile.

MODULE

ltm persistence

SYNTAX

Configure the universal component within the ltm persistence module using the syntax in the following sections.

MODIFY

create universal [name]

modify universal [name]

options:

app-service [[string] | none]

defaults-from [name]

description [string]

match-across-pools [enabled | disabled]

match-across-services [enabled | disabled]

match-across-virtuals [enabled | disabled]

method [hash | insert | passive | rewrite]

mirror [enabled | disabled]

override-connection-limit [enabled | disabled]

rule [ [iRule name] | none]

timeout [integer]

edit universal [ [name] | [glob] | [regex] ] ... ]

options:

all-properties

non-default-properties

mv universal [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]] ]

options:

to-folder

DISPLAY

list universal

list universal [ [name] | [glob] | [regex] ] ... ]

show running-config universal

show running-config universal [ [name] | [glob] | [regex] ] ... ]

options:

all-properties

non-default-properties

one-line

partition

DELETE

delete universal [name]

DESCRIPTION

You can use the universal component to configure a universal persistence profile for the BIG-IP(r) system. With universal persistence you can write an expression that defines what to persist on in a packet. The expression, written using the same expression syntax that you use in iRules(r), defines some sequence of bytes to use as a session identifier.

A persistence profile is a profile that enables persistence when you assign the profile to a virtual server. Using a persistence profile means that you do not have to write an iRule to implement a type of persistence. You can either use the default profile, or create a custom profile based on the default.

EXAMPLES

list universal

Displays all universal persistence profiles.

```
create universal uni_persistence defaults-from universal
```

Creates a custom universal persistence profile named `uni_persistence` that inherits its settings from the default universal persistence profile.

```
mv universal /Common/my_universal_profile to-folder /Common/my_folder
```

Moves a custom universal persistence profile named `my_universal_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

##### defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is `universal`, the system default cookie persistence profile.

##### description

User defined description.

`glob` Displays the items that match the `glob` expression. See help `glob` for a description of `glob` expression syntax.

##### match-across-pools

Specifies, when enabled, that the system can use any pool that contains this persistence record. The default value is disabled.

##### match-across-services

Specifies, when enabled, that all persistent connections from a client IP address, which go to the same virtual IP address, also go to the same node. The default value is disabled.

##### match-across-virtuals

Specifies, when enabled, that all persistent connections from the same client IP address go to the same node. The default value is disabled.

##### mirror

Specifies whether the system mirrors persistence records to the high-availability peer. The default value is disabled.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

##### override-connection-limit

Specifies, when enabled, that the pool member connection limits are not enforced for persisted clients. Per-virtual connection limits remain hard limits and are not disabled. The default value is disabled.

##### partition

Displays the administrative partition within which the component resides.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

`rule` Specifies an `iRule` name when you are using a rule for universal persistence.

##### timeout

Specifies the duration of the persistence entries. The default value is 180 seconds.

##### to-folder

universal persistence profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm virtual`, `modify`, `mv`, `regex`, `show`, `tmsh`

#### COPYRIGHT

## ltm policy-strategy

**NAME**  
policy-strategy - Configures policy-strategy for Centralized Policy Manager.

**MODULE**  
ltm

**DESCRIPTION**  
The policy-strategy component stores the different matching strategies employed by LTM Policy engine. Strategy comes into play when a policy has multiple rules, and the behavior of the policy can be customized as the situation requires.

There are 3 pre-defined matching strategies: "first-match", "all-match", and "best-match". A "first-match" strategy terminates the matching engine on the first condition that matches and executes that rule's actions. An "all-match" strategy will execute the actions for all conditions that match.

The "best-match" strategy is intended for situations when multiple conditions match simultaneously, and allows for the more specific match to win. For example, one rule may match the http-uri hostname while another may match the http-uri extension. The system has a built-in table defining combinations of event, operand, and selector, and an associated precedence value for each combination. When multiple rules match in a "best-match" situation, then the condition with the lowest ordinal value of event-operand-selector precedence is declared to be the most specific, and its actions are executed.

Generally policy-strategy should not require additions or changes. However, it could make sense to create user-defined policy-strategy when a "best-match" strategy is desired, but the built-in precedence table does not reflect the organization's idea of which operand-selector combinations are most specific.

For additional details, refer to Local Traffic Policy documentation on the AskF5 knowledge base at <http://support.f5.com>.

```
CREATE/MODIFY
create policy-strategy [name]
modify policy-strategy [name]
options:
    [ strategy | [ all-match | best-match | first-match ] ]
    operands [add | delete | modify | replace-all-with] {
ORDINAL {
    [OPERAND] [EVENT] [SELECTOR]
}
}
[ app-service [VALUE | none]]
[ partition VALUE ]
```

where

**strategy**  
Specifies the match method: all-match, best-match, or first-match.

**operands**  
Define a combination of event, operand, selector, and associate it with an ordinal precedence value.

**ORDINAL**  
Integer precedence value, lower value indicates a higher precedence.

**OPERAND**  
Entity to compare, see some examples in Precedence Table below, or ltm\_policy documentation for list with descriptions.

**EVENT**  
Framework event like request or response, default is "request" if not specified.

**SELECTOR**  
More specific part of operand, default is "all" if not specified. See some examples in the Precedence Table below, or ltm\_policy documentation for list and descriptions.

**app-service**  
Specifies the name of the application service to which the policy strategy belongs. The default value is "none" if not specified. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the policy strategy. Only the application service can modify or delete the policy strategy.

```
DISPLAY
list policy-strategy
list policy-strategy [ [ [name] | [glob] | [regex] ] ... ]
options:
    all-properties
    non-default-properties
    one-line
    partition
```

DELETE  
delete policy-strategy [name]

EXAMPLES

```
create policy-strategy my_strategy strategy first-match
```

Creates the policy strategy my\_strategy which matches the first rule selected.

Precedence Table

DELETE
delete policy [name]
```

Note: Before a policy can be deleted, it must be removed from all virtual servers holding a reference to it.

DESCRIPTION  
An LTM Policy is a set of rules which can be attached to a virtual server to efficiently process traffic. Similar in concept to iRules, Policies can inspect requests and responses, and perform programmed actions.

It is not necessary to specify controls or requires aspects for a policy. These will be automatically set based on an inspection of which conditions and actions are used in LTM Policy rules.

EXAMPLES  
create policy Drafts/my\_policy  
strategy my\_strategy

Creates a Local Traffic Manager policy in the Drafts folder named my\_policy. The strategy determining policy actions is my\_strategy. Draft policies may be modified, but cannot be applied to a virtual server until they are published.

```
create ltm policy Drafts/new_policy copy-from published_policy
create ltm policy Drafts/new_policy copy-from Drafts/old_policy
```

Creates a Local Traffic Manager policy based on an existing published policy, and from an existing draft policy, respectively.

```
modify ltm policy new_policy create-draft
```

Creates a draft policy of an existing published policy.

`publish ltm policy Drafts/my_policy`

Takes a policy that was created or modified in the Drafts folder, and publishes it. Published policies can then be applied to a virtual server.

`delete policy my_policy`

Deletes the policy named `my_policy`.

`show policy`

Displays statistics and status for all Local Traffic Manager policies in the system configuration.

`show policy all-properties`

Displays statistics and status for all Local Traffic Manager policies in the system configuration.

Note that if the system includes Packet Velocity(r) ASIC (PVA) and PVA Assist capabilities, this command displays status and statistics for that feature.

`list policy my_policy`

Displays properties of the policy named `my_policy`.

`app-service` - Specifies the name of the application service to which the policy belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the policy. Only the application service can modify or delete the policy.

`CONTROLS_ASPECT` is one or more of the following:

`none` - Associated with unrestricted actions that are always available, like logging.

`forwarding` - Enables many options for Forwarding connections to the back end.

`caching` - Caching enable or disable on a per-request basis.

`compression` - Actions which enable / disable compression and decompression. Virtual server will need to have an appropriate compression profile applied.

`acceleration` - Enable or disable Web Acceleration

`asm` - Enable or disable Application Security Management

`avr` - Enable or disable Application Visibility Reporting

`l7dos` - Enable or disable Layer 7 Denial-of-Service protection

`classification` - Used by the Traffic classification engine

`request-adaptation` - Enable or disable Request Adaptation

`response-adaptation` - Enable or disable Response Adaptation

`server-ssl` - Enable or disable SSL connection on the server side

`websocket` - Actions related to WebSockets

`REQUIRES_ASPECT` is one or more of the following:

`none` - Associated with conditions that are always available, like `cpu-usage`, with no specific profiles required to be attached to a virtual server

`http` - Makes available HTTP-specific conditions. An HTTP profile needs to be attached to a virtual server with this policy.

`tcp` - A TCP profile needs to be attached to a virtual with this policy. Makes available TCP-specific conditions.

`client-ssl` - A Client-SSL profile needs to be attached to a virtual with this policy.

`ssl-persist` - SSL persistence. Requires a persistence profile of type `ssl` to be present on virtual server.

`classification` - A classification profile needs to be attached to a virtual with this policy.

Data Types

`BOOLEAN` - [true\* | false]

`NUMBER` - signed 32-bit integer

`STRING` - Bare\_string -or- "quoted string"

`TCLSTRING` - A STRING optionally containing Tcl command substitutions to be evaluated at runtime. If string begins with the 4-character prefix "tcl:", then the prefix is removed and the rest of the string is passed to the Tcl interpreter. If no prefix, then whole string is treated as a plain string with no Tcl interpreter overhead. Examples:

```
log request message "tcl:This is Tcl-enabled and the URI is [HTTP:uri]"
log request message "This is just a plain old string"
```

IP\_ADDRESS - IPv4 or IPv6 address

Comparison operators

Core to defining conditions is the need to compare quantities at run time against pre-defined values. LTM Policy allows you to specify single or multiple values in a comparison.

NUMBER\_COMPARISON

```
[not] [equals* | less | greater | less-or-equal | greater-or-equal]
values { VAL1 [[VAL2] ...]}
```

Sample numeric comparisons:

```
not greater values { 1024 } # no more than 1024
values { 80 443 8080 } # compare against 80, 443, or 8080, equals implied
```

STRING\_COMPARISON

```
[not] [equals* | starts-with | ends-with | contains]
values { VAL1 [[VAL2 ...]] [case-insensitive* | case-sensitive ]
```

Sample string comparisons:

```
equals values { Abel bAkEr chArLle } # case-insensitive match of 3 candidates
values { Abel bAkEr chArLle } # same as above, equals implied
ends-with values { html txt } # match if string ends with either candidate
contains values { "jj83Q@#@AFRT@==" } case-sensitive # match value, case must match
```

\*default if not specified

CONDITION\_SPEC

A CONDITION\_SPEC, or condition specification, is where you can tell the system the specific attributes you would like to inspect and use as a trigger for action.

Conditions are associated with an event, so conditions can be evaluated at different times during a request-response cycle.

Below is a list of all supported conditions, the events during which they can be evaluated, additional qualifiers, and parameters.

http-uri

Inspect the URI on a request and match on various parts or the entire URI (since 11.4.0)

Specifying http-uri in a condition automatically adds "requires {http}" to the policy.

```
http-uri [request*]
[all STRING_COMPARISON
 [normalized BOOL]
]
[scheme STRING_COMPARISON
 [normalized BOOL]
]
[host STRING_COMPARISON
 [normalized BOOL]
]
[port NUMBER_COMPARISON
 [normalized BOOL]
]
[path STRING_COMPARISON
 [normalized BOOL]
]
[extension STRING_COMPARISON
 [normalized BOOL]
]
[query-string STRING_COMPARISON
 [normalized BOOL]
]
[query-param STRING_COMPARISON
 name STRING
 [normalized BOOL]
]
[unnamed-query-param STRING_COMPARISON
 index NUMBER
 [normalized BOOL]
]
[path-segment STRING_COMPARISON
 index NUMBER
 [normalized BOOL]
]
```

where

all - match on the full URI  
normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
scheme - match on the scheme, e.g. http, https, ftp,  
file  
normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
host - match on the hostname in the URI  
normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
port - match on the port number in the URI  
normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
path - match on the URI path

normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
 extension - match on the file extension in the URI, e.g. jpg, html, cgi  
 normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
 query-string - match against text in the query string  
 normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
 query-param - match value of the named query parameter from the query string  
 name - Specify the name of the particular query parameter whose value is to be used  
 normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
 unnamed-query-param - match the value of a query parameter by a numeric index instead of by name  
 index - The numeric order of the query parameter whose value is to be used, starting at 1. Negative values indicate counting right to left.  
 normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
 path-segment - Match a part of the URI path by a numeric index  
 index - The numeric order of a segment in the path, starting at 1. Negative values indicate counting right to left.  
 normalized - Normalizes the result to a canonical form to allow consistent comparisons.

tcp

Inspect and match on various TCP properties of a connection (since 11.5.0)

Specifying tcp in a condition automatically adds "requires {tcp}" to the policy.

```

tcp [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response |
ws_request | ws_response | classification-detected]
  [address IP_COMPARISON
  [internal BOOL]
  [local BOOL]
  ]
  [port NUMBER_COMPARISON
  [internal BOOL]
  [local BOOL]
  ]
  [mss NUMBER_COMPARISON
  [internal BOOL]
  ]
  [rtt NUMBER_COMPARISON
  [internal BOOL]
  ]
  [vlan STRING_COMPARISON
  [internal BOOL]
  ]
  [vlan_id NUMBER_COMPARISON
  [internal BOOL]
  ]
  [route_domain NUMBER_COMPARISON
  [internal BOOL]
  ]

```

where

address - Match on IP address. By default the IP address is the one associated with the external interface, remote end of the connection.  
 internal - Internal specifies the IP address of the endpoint on the "internal" side of the connection.  
 local - Local specifies the IP address of the local side of the connection, i.e. not the remote side.  
 port - Match on port number. By default the port is the one associated with the external interface, remote end of the connection.  
 internal - Internal specifies the port of the endpoint on the "internal" side of the connection.  
 local - Local specifies the port of the local side of the connection, i.e. not the remote side.  
 mss - Compare the TCP maximum segment size on the external network interface.  
 internal - Refers to the maximum segment size on the internal interface.  
 rtt - Inspect the round trip time on the external network interface.  
 internal - Refers to the round trip time on the internal interface.  
 vlan - Compare traffic with specified vlan on the external network interface.  
 internal - Refers to the vlan on the internal interface.  
 vlan\_id - Compare traffic with specified vlan-id number on the external network interface.  
 internal - Refers to the vlan\_id on the internal interface.  
 route domain - Compare traffic with specified route domain number on the external network interface.  
 internal - Specifies the route domain on the internal interface.

## Examples

```
tcp address matches values { 141.202.53.16 }
tcp address internal matches values { 192.168.63.1 192.168.63.121 }
tcp port matches values { 8080 3128 }
```

## client-ssl

Inspect properties of the SSL connection on the client side of the device. (since 11.4.0)

Specifying client-ssl in a condition automatically adds "requires {client-ssl}" to the policy.

```
client-ssl [request* | response]
[protocol STRING_COMPARISON]
[cipher STRING_COMPARISON]
[cipher-bits NUMBER_COMPARISON]
```

where

```
protocol - Compare SSL protocol name
cipher - Cipher name
cipher-bits - cipher strength in number of bits
```

## http-method

Inspect the request's HTTP method, e.g. GET, POST, HEAD (since 11.4.0)

Specifying http-method in a condition automatically adds "requires {http}" to the policy.

```
http-method [request*]
all STRING_COMPARISON
```

Example

```
http-method all values { POST }
```

## http-version

Inspect the version of an HTTP request or response (since 11.4.0)

Specifying http-version in a condition automatically adds "requires {http}" to the policy.

```
http-version [request* | response]
[all STRING_COMPARISON]
[protocol STRING_COMPARISON]
[major NUMBER_COMPARISON]
[minor NUMBER_COMPARISON]
```

where

```
all - Compare against full version string
protocol - HTTP protocol
major - Numeric major part of HTTP version
minor - Numeric minor part of HTTP version
```

## Examples

```
http-version all contains values { HTTP/1.1 }
http-version protocol values { HTTP }
http-version major values { 1 }
http-version minor greater-or-equal values { 0 }
```

## http-status

Inspect the HTTP response's status (since 11.4.0)

Specifying http-status in a condition automatically adds "requires {http}" to the policy.

```
http-status [response*]
[all STRING_COMPARISON]
[code NUMBER_COMPARISON]
[text STRING_COMPARISON]
```

where

```
all - Compare against full HTTP status response
including both code and text
code - Numeric HTTP response status code
text - HTTP response status string, e.g.
"Authentication Required"
```

## Examples

```
http-status response values { "HTTP/1.1 200 OK" }
http-status response code values { 401 }
http-status response text contains values { "Authentication Required" }
```

## http-host

Match against an HTTP request's Host: header (since 11.4.0)

Specifying http-host in a condition automatically adds "requires {http}" to the policy.

```
http-host [request*]
[all STRING_COMPARISON]
```

```
[host STRING_COMPARISON]
[port NUMBER_COMPARISON]
```

where

```
all - Compare against full Host header string
host - compare against hostname
port - compare against port number
```

Examples

```
http-host values { example.com }
http-host host values { ns1.example.com ns2.example.com }
http-host port values { 80 443 3128 8080 }
```

http-header

Match against any HTTP header (since 11.4.0)

Specifying http-header in a condition automatically adds "requires {http}" to the policy.

```
http-header [request* | response]
  all STRING_COMPARISON
  name STRING
```

Example

```
http-header response name Content-type starts-with values { text/ }
```

http-referer

Inspect HTTP Referer: header or specific parts of the URI value. (since 11.4.0)

Specifying http-referer in a condition automatically adds "requires {http}" to the policy.

```
http-referer [request*]
[all STRING_COMPARISON
 [normalized BOOL]
]
[scheme STRING_COMPARISON
 [normalized BOOL]
]
[host STRING_COMPARISON
 [normalized BOOL]
]
[port NUMBER_COMPARISON
 [normalized BOOL]
]
[path STRING_COMPARISON
 [normalized BOOL]
]
[extension STRING_COMPARISON
 [normalized BOOL]
]
[query-string STRING_COMPARISON
 [normalized BOOL]
]
[path-segment STRING_COMPARISON
 index NUMBER
 [normalized BOOL]
]
[query-param STRING_COMPARISON
 name STRING
 [normalized BOOL]
]
[unnamed-query-param STRING_COMPARISON
 index NUMBER
 [normalized BOOL]
]
```

where

```
all - entire URI, e.g.
http://example.com/path/to/page.cgi?a=b&c=d
normalized - Normalizes the result to a canonical
form to allow consistent comparisons.
scheme - e.g. http, https, ftp
normalized - Normalizes the result to a canonical
form to allow consistent comparisons.
host - DNS hostname or IP address
normalized - Normalizes the result to a canonical
form to allow consistent comparisons.
port - numeric port number, e.g. 80
normalized - Normalizes the result to a canonical
form to allow consistent comparisons.
path - URI path, e.g. /path/to
normalized - Normalizes the result to a canonical
form to allow consistent comparisons.
extension - document extension, e.g. cgi
normalized - Normalizes the result to a canonical
form to allow consistent comparisons.
query-string - full query string, e.g. a=b&c=d
normalized - Normalizes the result to a canonical
form to allow consistent comparisons.
path-segment - path segment by numerical index
index - Identify a segment of a path by its
numerical order starting at 1. Negative values
indicate counting right to left.
normalized - Normalizes the result to a canonical
form to allow consistent comparisons.
```

query-param - value of query param by name  
name - Identify a query string parameter by its name  
normalized - Normalizes the result to a canonical form to allow consistent comparisons.  
unnamed-query-param - value of query parameter by numerical index  
index - Identify a query string parameter by its numerical order starting at 1. Negative values indicate counting right to left.  
normalized - Normalizes the result to a canonical form to allow consistent comparisons.

#### Examples

```
http-referer request all contains values { cgi }
http-referer request all scheme values { http https }
http-referer request all host values { example.com 127.0.0.1 }
http-referer request all port values { 80 8080 }
http-referer request all path contains values { /cgi-bin/ }
http-referer request all extension contains values { xml xhtml xsd }
http-referer request all query-string contains values { __utmz }
http-referer path-segment index 2 values { to }
http-referer query-parameter name foo contains values { bar }
http-referer request unnamed-query-param index 1 values { a }
```

#### http-cookie

Inspect an HTTP request's Cookie: header (since 11.4.0)

Specifying http-cookie in a condition automatically adds "requires {http}" to the policy.

```
http-cookie [request*]
  all STRING_COMPARISON
  name STRING
```

#### Example

```
http-cookie name User values { xyz123 }
```

#### http-set-cookie

Inspect an HTTP response's Set-Cookie: header (since 11.4.0)

Specifying http-set-cookie in a condition automatically adds "requires {http}" to the policy.

```
http-set-cookie [response*]
  [value STRING_COMPARISON
  name STRING
  ]
  [version STRING_COMPARISON
  name STRING
  ]
  [path STRING_COMPARISON
  name STRING
  ]
  [domain STRING_COMPARISON
  name STRING
  ]
  [expiry STRING_COMPARISON
  name STRING
  ]
]
```

#### where

value - value of the named cookie named by the parameter  
version - version of the named cookie  
path - path of the named cookie  
domain - value of the domain specified by the named cookie  
expiry - Time when validity of named cookie expires, in RFC 6265 format (Wdy, DD Mon YYYY HH:MM:SS GMT)

#### Examples

```
http-set-cookie response value name Cust-Id values { org177 org187 org197 }
http-set-cookie response version name mycook values { 1.1 }
http-set-cookie response path name mycook values { /private/cgi-bin/ }
http-set-cookie response domain name mycook values { example.com }
http-set-cookie response expiry name MyCookie contains values { "Wed, 09 Jun 2021" }
```

#### http-basic-auth

Inspect an HTTP request's username/password specified for Basic authentication. (since 11.4.0)

Specifying http-basic-auth in a condition automatically adds "requires {http}" to the policy.

```
http-basic-auth [request*]
  [username STRING_COMPARISON]
  [password STRING_COMPARISON]
```

#### where

username - basic authentication username  
password - basic authentication password

#### Example

```
http-basic-auth password not values { password }
```

#### ssl-extension

Inspect SSL extensions being negotiated during HELLO phase. (since 11.4.0)

Specifying ssl-extension in a condition automatically adds "requires {ssl-persist}" to the policy.

```
ssl-extension [ssl-client-hello* | ssl-server-hello]
[server-name STRING_COMPARISON]
[npn STRING_COMPARISON]
[index NUMBER]
]
[alpn STRING_COMPARISON]
[index NUMBER]
]
```

#### where

server-name - server name indication  
npn - next protocol negotiation  
alpn - application layer protocol negotiation

#### Example

```
ssl-extension ssl-client-hello server-name values { secure43.example.org }
```

#### ssl-cert

Inspect properties of an SSL certificate. (since 11.4.0)

Specifying ssl-cert in a condition automatically adds "requires {ssl-persist}" to the policy.

```
ssl-cert [ssl-server-handshake*]
common-name STRING_COMPARISON
[index NUMBER]
```

#### where

common-name - hostname covered by the SSL certificate

#### geoip

Specify a condition based upon properties of the geographical location of the IP address, such as continent code, country code, city, region, or organization. The default is to inspect the external interface, remote endpoint. (since 11.5.0)

This condition is available to all policies.

```
geoip [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response]
[continent STRING_COMPARISON]
[internal BOOL]
[local BOOL]
]
[country-code STRING_COMPARISON]
[internal BOOL]
[local BOOL]
]
[country-name STRING_COMPARISON]
[internal BOOL]
[local BOOL]
]
[region-code STRING_COMPARISON]
[internal BOOL]
[local BOOL]
]
[region-name STRING_COMPARISON]
[internal BOOL]
[local BOOL]
]
[org STRING_COMPARISON]
[internal BOOL]
[local BOOL]
]
[isp STRING_COMPARISON]
[internal BOOL]
[local BOOL]
]
```

#### where

continent - Two-character continent code: AF, AN, AS, OC, EU, NA, SA  
country-code - Two-character country code as defined in ISO-3166-2  
country-name - Full name of country  
region-code - Abbreviation of State, Province, or country-specific region  
region-name - Full name of State, Province, or country-specific region  
org - Organization associated with address  
isp - Internet Service Provider associated with address

#### Examples

```
geoip continent values { NA }
geoip country-code values { us }
geoip country-name values { "United States" }
geoip region-code values { NY CA TX }
geoip region-name values { Washington Oregon Idaho }
geoip organization values { "Acme Widgets" }
geoip isp values { "Fastcast Networks" "Responsive Cable Inc." }
```

#### cpu-usage

Specify a condition based upon CPU usage percentage for the past 15 seconds, 1 minute or 5 minutes intervals. (since 11.5.0)

This condition is available to all policies.

```
cpu-usage [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response]
  [last-15secs NUMBER_COMPARISON]
  [last-1min NUMBER_COMPARISON]
  [last-5mins NUMBER_COMPARISON]
```

#### where

```
last-15secs - CPU usage ratio % over the past 15
seconds, 0-100
last-1min - CPU usage ratio % over the past minute,
0-100
last-5mins - CPU usage ratio % over the past 5
minutes, 0-100
```

#### Examples

```
cpu-usage request last-15secs 8
cpu-usage response last-1min 10
cpu-usage last-5mins 12
```

#### http-user-agent

Specify a condition based upon User Agent sub-string, i.e. version, browser type, or mobile device make and model. (since 11.4.0)

Specifying http-user-agent in a condition automatically adds "requires {http}" to the policy.

```
http-user-agent [request*]
  [device-make STRING_COMPARISON]
  [device-model STRING_COMPARISON]
  [browser-type STRING_COMPARISON]
  [browser-version STRING_COMPARISON]
  [ua-token STRING_COMPARISON]
  name STRING
]
```

#### where

```
device-make - Make of device
device-model - Model of device
browser-type - Browser name/type
browser-version - Browser version string
ua-token - Sub version string associated with
specified parameter
```

#### Examples

```
http-user-agent device-make values { Samsung ASUS }
http-user-agent device-model values { DroidX }
http-user-agent request browser-type values { Mozilla }
http-user-agent request browser-version values { "37.0.2049.0" }
http-user-agent user-agent-token name Mozilla values { 9.0 }
```

#### websocket

Specify a condition based upon properties of a websockets connection. (since 12.1.0)

Specifying websocket in a condition automatically adds "requires {websocket}" to the policy.

```
websocket [ws_request* | ws_response]
  [protocol STRING_COMPARISON]
  [extension STRING_COMPARISON]
  [version STRING_COMPARISON]
  [ws_key STRING_COMPARISON]
```

#### where

```
protocol - value of the Sec-WebSocket-Protocol header
extension - value of the Sec-WebSocket-Extensions
header
version - value of the Sec-WebSocket-Version header
ws_key - value of the masking-key
```

#### classification

Specify a condition based on flow's classification results. (since 13.0.0)

Specifying classification in a condition automatically adds "requires {classification}" to the policy.

```
classification [classification-detected*]
```

```
[application STRING_COMPARISON]
[application-id NUMBER_COMPARISON]
[application-risk NUMBER_COMPARISON]
[category STRING_COMPARISON]
[category-id NUMBER_COMPARISON]
[url-category STRING_COMPARISON]
[url-category-id NUMBER_COMPARISON]
```

where

```
application - Classification Application Name
application-id - Classification Application ID
application-risk - Classification Application Risk
category - Application's category name
category-id - Application's category ID
url-category - URL's category name
url-category-id - URL's category ID
```

Examples

```
application values { cnn youtube }
application-id values { 1245 }
application-risk greater-or-equal values { 3 }
category values { News_And_Media }
category-id values { 16666 }
url-category starts-with values { News }
url-category-id values { 25555 }
```

#### ACTION\_SPEC

An ACTION SPEC, or action specification, is where you can tell the system the specific programmed actions you would like to take.

Actions are associated with an event, and depending on the action, can be set to run at different times during the request-response cycle.

Below is a list of all supported actions, the events during which they can be executed, their specific sub-actions, and parameters (if any).

ltm-policy

Provides the ability to disable LTM Policy processing on a request by request basis. (since 11.4.0)

This action is available to all policies.

```
ltm-policy [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response]
disable*
```

http

Provides the ability to enable or disable Big Ip's HTTP filter processing (since 11.4.0)

This action is available to all policies.

```
http [request* | response]
[enable*]
[disable]
```

http-uri

Modify the request's URI or path or query string. Setting URI value overrides path and query-string setting. (since 11.4.0)

This action is available to all policies.

```
http-uri [request*]
replace*
[value TCLSTRING]
[path TCLSTRING]
[query-string TCLSTRING]
```

http-host

Modify the request's Host: header (since 11.4.0)

This action is available to all policies.

```
http-host [request*]
replace*
value TCLSTRING
```

http-header

Modify HTTP header in request or response (since 11.4.0)

This action is available to all policies.

```
http-header [request* | response]
[replace*
name STRING
value TCLSTRING
]
[insert
name STRING
value TCLSTRING
]
[remove
name STRING
]
```

http-referer

Modify the request's Referer: header (since 11.4.0)

This action is available to all policies.

```
http-referer [request*]
  [replace*
   [value TCLSTRING]
  ]
  [insert
   value TCLSTRING
  ]
  [remove]
```

where

replace - Replace request's Referer: header.  
value - New value for request's Referer: header.  
Values beginning with "tcl:" are treated as Tcl  
command substitutions and expanded before use.  
insert - Insert an HTTP Referer: header into the

request

value - New value for request's Referer: header.  
Values beginning with "tcl:" are treated as Tcl  
command substitutions and expanded before use.

remove - Remove the HTTP Referer: header from the  
request

http-cookie

Modify the request's Cookie: header (since 11.4.0)

This action is available to all policies.

```
http-cookie [request*]
  [insert*
   name STRING
   [value TCLSTRING]
  ]
  [remove
   name STRING
  ]
```

where

insert - Insert an HTTP Cookie: header into the  
request

name - Name of the cookie being inserted into  
request's Cookie: header.

value - New value for the cookie in the request's  
Cookie: header. Values beginning with "tcl:" are  
treated as Tcl command substitutions and expanded  
before use.

remove - Remove the HTTP Cookie: header from the  
request

name - Name of the cookie being inserted into  
request's Cookie: header.

Examples

```
http-cookie request insert name "Source-IP" value "tcl:[IP::remote_addr]"
http-cookie remove name "X-Tracker"
```

http-set-cookie

Modify the response's Set-Cookie: header (since 11.4.0)

This action is available to all policies.

```
http-set-cookie [response*]
  [insert*
   name STRING
   value TCLSTRING
   [domain TCLSTRING]
   [path TCLSTRING]
  ]
  [remove
   name STRING
  ]
```

where

insert - Insert an HTTP Set-Cookie: header into the  
response

name - Name of the cookie being inserted into  
response's Set-Cookie: header.  
value - New value for the cookie in the response's  
Set-Cookie: header. Values beginning with "tcl:"  
are treated as Tcl command substitutions and  
expanded before use.

domain - Value for the domain attribute of a  
cookie in Set-Cookie header. Tcl command  
substitutions are allowed for this field.

path - Value for the path attribute of a cookie in  
Set-Cookie header. Tcl command substitutions are  
allowed for this field.

remove - Remove the HTTP Cookie: header from the  
request

name - Name of the cookie to be removed from  
response's Set-Cookie: header.

http-reply

Redirect an HTTP request to a different URL (since 11.4.0)

Specifying http-reply in an action automatically adds "controls {forwarding}" to the policy.

```
http-reply [request* | response]
  redirect*
  location TCLSTRING
```

where

redirect - Redirect an HTTP request to a different URL  
location - The new URL for which a redirect response will be sent. A Tcl command substitution can be used for this field.

log

Write messages to local or remote system log (since 11.4.0)

This action is available to all policies.

```
log [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response |
ws_request | ws_response | classification-detected]
  write*
  message TCLSTRING
  [facility STRING]
  [priority STRING]
  [ip_address STRING]
  [port NUMBER]
```

where

write - Write a message to the system log files, local or remote  
message - The message to write to the system log. A Tcl command substitution is allowed here.  
facility - Standard syslog facility associated with message, such as auth, kern, daemon, user.  
priority - Standard syslog priority associated with message, such as emerg, alert, err, warning, notice, info, debug.  
ip\_address - For remote logging, the IP address of the remote syslog server.  
port - For remote logging, the port number of the remote syslog server.

Examples

```
log request message "tcl:This is Tcl-enabled and the URI is [HTTP::uri]"
log request message "This is just a plain old string"
log request message "Something serious is happening!" priority alert
```

pem

Classify traffic (since 11.4.0)

Specifying pem in an action automatically adds "controls {classification}" to the policy.

```
pem [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response]
  classify*
  [application STRING]
  [category STRING]
  [protocol STRING]
  [defer BOOL]
  [ssl-session-id BOOL]
```

where

classify - Classify traffic

ce

Classify traffic (since 12.1.0)

Specifying ce in an action automatically adds "controls {ce}" to the policy.

```
ce [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response]
  classify*
  [application STRING]
  [category STRING]
```

where

classify - Classify traffic

cache

Control caching (since 11.4.0)

Specifying cache in an action automatically adds "controls {caching}" to the policy.

```
cache [request* | response]
  [enable*
  [pin BOOL]
  ]
  [disable]
```

where

- enable - Enable caching for a connection
- disable - Disable caching for a connection

compress

Control compression (since 11.4.0)

Specifying compress in an action automatically adds "controls {compression}" to the policy.

```
compress [request* | response]
  [enable*]
  [disable]
```

where

- enable - Enable compression for a connection
- disable - Disable compression for a connection

decompress

Control decompression (since 11.4.0)

Specifying decompress in an action automatically adds "controls {compression}" to the policy.

```
decompress [request* | response]
  [enable*]
  [disable]
```

where

- enable - Enable decompression for a connection
- disable - Disable decompression for a connection

forward

Many options for controlling where a connection is forwarded (since 11.4.0)

Specifying forward in an action automatically adds "controls {forwarding}" to the policy.

```
forward [ssl-client-hello* | request]
  [select*
  [pool STRING]
  [clone-pool STRING]
  [node STRING]
  [snat STRING]
  [snatpool STRING]
  [nexthop STRING]
  [vlan STRING]
  [vlan-id NUMBER]
  [virtual STRING]
  [rateclass STRING]
  ]
  [reset]
```

where

select - Select appropriate location for forwarding the connection based on specified parameters. While all of the parameters are marked as optional, at least one must be specified.

pool - Forward connection to the specified pool.

clone-pool - Clone traffic to the specified clone pool.

node - Forward connection to the specified node.

snat - Control snat automap.

snatpool - Forward connection to the specified snat pool.

nexthop - Set the next destination for the connection to the specified endpoint. A vlan or vlan-id must also be specified.

vlan - Forward connection to the specified vlan.

vlan-id - Forward connection to the vlan specified by the vlan-id.

virtual - Forward connection to the specified virtual server.

rateclass - Control rate class properties on the connection.

reset - Reset the connection

persist

Many options for controlling how a connection is persisted (since 12.0.0)

Specifying persist in an action automatically adds "controls {persistence}" to the policy.

```
persist [request*]
  [disable]
  [src-addr*
  [netmask STRING]
  [timeout NUMBER]
  ]
  [dest-addr
  [netmask STRING]
  [timeout NUMBER]
  ]
  ]
```

```

[cookie-insert
 [name STRING]
 [expiry STRING]
]
[cookie-rewrite
 [name STRING]
 [expiry STRING]
]
[cookie-passive
 [name STRING]
]
[cookie-hash
 name STRING
 [offset NUMBER]
 [length NUMBER]
 [timeout NUMBER]
]
[universal
 key TCLSTRING
 [timeout NUMBER]
]
[hash
 key TCLSTRING
 [timeout NUMBER]
]
[carp
 key TCLSTRING
 [timeout NUMBER]
]
]

```

where

```

disable - Disable persistence
src-addr - Persist the connection based on the source
IP address.
netmask - Network mask, e.g. 192.168.13.23/16 or
10.0.2.15/255.0.0.0.
timeout - Timeout value in seconds.
dest-addr - Persist the connection based on the
destination IP address.
netmask - Network mask, e.g. 192.168.13.23/16 or
10.0.2.15/255.0.0.0.
timeout - Timeout value in seconds.
cookie-insert - Persist the connection using cookie
insertion method
name - cookie name
expiry - Expiration duration expressed as [Dd]
[HH:]MM:]SS
cookie-rewrite - Persist the connection using cookie
rewrite method
name - cookie name
expiry - Expiration duration expressed as [Dd]
[HH:]MM:]SS
cookie-passive - Persist the connection using cookie
passive method
name - cookie name
cookie-hash - Persist the connection using cookie hash
method
name - cookie name
offset - offset into hash
length - substring length
timeout - Timeout value in seconds.
universal - persistence based on user-defined key
key - The key to use. Tcl command substitution is
allowed.
timeout - Timeout value in seconds.
hash - persistence based on hash of the key
key - The key to use. Tcl command substitution is
allowed.
timeout - Timeout value in seconds.
carp - hash persistence using Cache Array Routing
Protocol (CARP) algorithm
key - The key to use. Tcl command substitution is
allowed.
timeout - Timeout value in seconds.

```

wam

Control web acceleration (since 11.4.0)

Specifying wam in an action automatically adds "controls {wam}" to the policy.

```

wam [request*]
 [enable*]
 [disable]

```

where

```

enable - Enable web acceleration for a connection
disable - Disable web acceleration for a connection

```

asm

Control web security (since 11.4.0)

Specifying asm in an action automatically adds "controls {asm}" to the policy.

```

asm [request*]
 [enable*]
 policy STRING
]
 [disable]

```

where

enable - Enable web security for a connection  
policy - name of security policy to enable  
disable - disable web security for the connection

l7dos

Enable or disable Layer 7 Denial-of-Service processing (since 11.4.0)

Specifying l7dos in an action automatically adds "controls {l7dos}" to the policy.

```
l7dos [request*]
  [enable*
   [from-profile STRING]
  ]
  [disable]
```

where

enable - turn on Layer 7 DOS protection  
from-profile - name of DOS profile to enable  
disable - turn off Layer 7 DOS protection

avr

Enable or disable Application Visibility and Reporting (since 11.4.0)

Specifying avr in an action automatically adds "controls {avr}" to the policy.

```
avr [request*]
  [enable*]
  [disable]
```

where

enable - turn on reporting  
disable - turn off reporting

tcl

Set a Tcl variable in runtime environment (since 11.4.0)

This action is available to all policies.

```
tcl [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response]
  set-variable*
  name STRING
  expression STRING
```

where

set-variable - set a Tcl variable in the runtime environment  
name - name of variable  
expression - Tcl expression to evaluate

Example

```
tcl set-variable expression tcl:[HTTP::uri] name my_uri
```

request-adapt

Enable or disable request adaptation, optionally sending traffic to specified internal virtual server (since 11.4.0)

Specifying request-adapt in an action automatically adds "controls {request-adaptation}" to the policy.

```
request-adapt [request* | response]
  [enable*
   [internal-virtual STRING]
  ]
  [disable]
```

where

enable - turn on request adaptation  
internal-virtual - which internal virtual server  
disable - turn off request adaptation

response-adapt

Enable or disable response adaptation, optionally sending traffic to specified internal virtual server (since 11.4.0)

Specifying response-adapt in an action automatically adds "controls {response-adaptation}" to the policy.

```
response-adapt [request* | response]
  [enable*
   [internal-virtual STRING]
  ]
  [disable]
```

where

enable - turn on response adaptation  
internal-virtual - which internal virtual server

disable - turn off response adaptation

tcp-nagle

Enable or disable Nagle's algorithm on a connection (since 11.4.0)

This action is available to all policies.

```
tcp-nagle [request*]
  [enable*]
  [disable]
```

where

enable - turn on Nagle  
disable - turn off Nagle

server-ssl

Enable or disable encrypted connections to backend servers (since 11.4.0)

Specifying server-ssl in an action automatically adds "controls {server-ssl}" to the policy.

```
server-ssl [request*]
  [enable*]
  [disable]
```

where

enable - encrypted connection to backend  
disable - plaintext connection to backend

websocket

Enable or disable websocket processing (since 12.1.0)

Specifying websocket in an action automatically adds "controls {websocket}" to the policy.

```
websocket [ws_request* | ws_response | request |
response]
  [enable*]
  [disable]
```

where

enable - turn on websocket filter  
disable - turn off websocket filter

classification

Perform classification/enforcement of the connection (since 13.0.0)

Specifying classification in an action automatically adds "controls {classification}" to the policy.

```
classification [ssl-client-hello* | ssl-server-hello |
ssl-server-handshake | request | response |
classification-detected]
  [drop]
  [reject]
```

where

drop - Silently drop connection  
reject - Gracefully close connection

## ltm pool

NAME

pool - Configures load balancing pools for the Local Traffic Manager.

MODULE

ltm

SYNTAX

Modify the pool component within the ltm module using the syntax shown in the following sections.

```
CREATE/MODIFY
create pool [name]
modify pool [name]
options:
  all
  allow-nat [yes | no]
  allow-snat [yes | no]
  app-service [[string] | none]
  autoscale-group-id [[string] | none]
  description [string]
  gateway-failsafe-device [string]
  ignore-persisted-weight [yes | no]
  ip-tos-to-client [pass-through | [integer] ]
  ip-tos-to-server [pass-through | [integer] ]
  link-qos-to-client [pass-through | [integer] ]
  link-qos-to-server [pass-through | [integer] ]
  load-balancing-mode [dynamic-ratio-member | dynamic-ratio-node |
    fastest-app-response | fastest-node |
    least-connections-members |
    least-connections-node |
    least-sessions |
    observed-member | observed-node |
    predictive-member | predictive-node |
    ratio-least-connections-member |
    ratio-least-connections-node |
    ratio-member | ratio-node | ratio-session |
    round-robin | weighted-least-connections-member |
    weighted-least-connections-node]
  members [add | delete | modify | replace-all-with] {
    [ [node_name:port] ] {
      options:
        address [ip address]
        app-service [[string] | none]
        connection-limit [integer]
        description [string]
        dynamic-ratio [integer]
        inherit-profile [enabled | disabled]
        logging [enabled | disabled]
        monitor [name]
        priority-group [integer]
        profiles [none | profile_name]
        rate-limit [integer]
        ratio [integer]
        session [user-enabled | user-disabled]
        state [ user-up | user-down ]
        fqdn {
          name [string]
          address-family [ipv4 | ipv6]
          autopopulate [enabled | disabled]
          down-interval [integer]
          interval [integer]
        }
      }
    }
  }
  members none
  metadata
    [add | delete | modify] {
      [metadata_name ... ] {
        value [ "value content" ]
        persist [ true | false ]
      }
    }
  min-active-members [integer]
  min-up-members [integer]
  min-up-members-action [failover | reboot | restart-all]
  min-up-members-checking [enabled | disabled]
  monitor [name]
  profiles [none | profile_name]
  queue-on-connection-limit [enabled | disabled]
  queue-depth-limit [integer]
  queue-time-limit [integer]
  reselect-tries [integer]
  service-down-action [drop | none | reselect | reset]
  slow-ramp-time [integer]

edit pool [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

reset-stats pool
reset-stats pool [ [ [name] | [glob] | [regex] ] ... ]

mv pool [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-nam]
  options:
    to-folder

DISPLAY
list pool
list pool [ [ [name] | [glob] | [regex] ] ... ]
show running-config pool
show running-config pool [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
show pool
show pool [name]
options:
  all-properties
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  detail
  field-fmt
```

```
DELETE
delete pool [name]
```

Note: You must remove all references to a pool before you can delete the pool.

#### DESCRIPTION

You can use this pool component to configure the pool definitions on the Local Traffic Manager. A load balancing pool is a logical set of devices, such as Web servers, that you group together to receive and process traffic.

#### EXAMPLES

```
create pool my_pool members add { member 10.2.3.11:http member
10.2.3.12:http }
```

Creates a Local Traffic Manager pool named `my_pool` with two members, 10.2.3.11 and 10.2.3.12, using the default values for the pool and pool members.

```
delete pool my_pool
```

Deletes the pool named `my_pool`.

```
show pool
```

Displays statistics and status for all Local Traffic Manager pools in the system configuration.

```
show pool all-properties
```

Displays statistics and status for all Local Traffic Manager pools in the system configuration.

Note that if the system includes Packet Velocity(r) ASIC (PVA) and PVA Assist capabilities, this command displays status and statistics for that feature.

```
list pool my_pool
```

Displays properties of the pool named `my_pool`.

```
mv /ltm pool /Common/my_pool to-folder /Common/some_folder
```

Moves an LTM pool named `my_pool` and all of its Pool Members to the folder named `some_folder`, where `some_folder` has already been created under `/Common`.

Please refer to the `mv` manual page for additional examples on how to use the `mv` command.

#### OPTIONS

`all` Specifies that you want to modify all of the existing components of the specified type.

`allow-nat`

Specifies whether the pool can load balance network address translation (NAT) connections. The default value is `yes`.

`allow-snat`

Specifies whether the pool can load balance secure network address translation (SNAT) connections. The default value is `yes`.

`app-service`

Specifies the name of the application service to which the pool belongs. The default value is `none`. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the pool. Only the application service can modify or delete the pool.

`autoscale-group-id`

Specifies the `autoscale-group id` as reported by Amazon Web Services(AWS).

`description`

User defined description.

`gateway-failsafe-device`

Specifies that the pool is a gateway failsafe pool in a redundant configuration. The `gateway-failsafe-device` identifies the device that depends on the gateway. If the monitor associated with the pool reports that the gateway is down, the device goes to the standby state. The default value for this string is empty, the feature is not configured.

`glob` Displays the items that match the `glob` expression. See `help glob` for a description of `glob` expression syntax.

`traffic-acceleration-status`

Displays the current Traffic-Acceleration status. Indicates whether the pool is in-use by or dedicated to a virtual server that uses a traffic-acceleration profile.

`ignore-persisted-weight`

Discounts the weight of connections made to pool members selected

through persistence, rather than as a result of the algorithm configured on the pool. If the connection's weight is ignored, then it is not treated as a 'pick' for that pool member, and does not influence subsequent pool member load balancing decisions.

This option only impacts pools configured with one of the following load balancing modes: observed-member, observed-node, predictive-member, predictive-node, ratio-least-connections-member, ratio-least-connections-node, ratio-member, or ratio-node.

The default value is no, which results in persisted pool member connections being accounted for during load balancing calculations.

#### ip-tos-to-client

Specifies the Type of Service (ToS) level to use when sending packets to a client. The default value is 65535 (pass-through).

#### ip-tos-to-server

Specifies the ToS level to use when sending packets to a server. The default value is 65535 (pass-through).

#### link-qos-to-client

Specifies the Link Quality of Service (QoS) level to use when sending packets to a client. The default value is 65535 (pass-through).

#### link-qos-to-server

Specifies the Link QoS level to use when sending packets to a server. The default value is 65535 (pass-through).

#### load-balancing-mode

Specifies the modes that the system uses to load balance name resolution requests among the members of this pool. The default value is round-robin.

The options are:

#### dynamic-ratio-member

Specifies that the system distributes connections based on various aspects of real-time server performance analysis, such as the number of current connections per node or the fastest node response time.

This mode is similar to the dynamic-ratio-node mode, except that weights are based on continuous monitoring of the servers and are therefore continually changing.

#### dynamic-ratio-node

Specifies that the system distributes connections based on various aspects of real-time server performance analysis, such as the number of current connections per node or the fastest node response time.

This mode is similar to the dynamic-ratio-member mode, except that weights are based on continuous monitoring of the servers and are therefore continually changing.

#### fastest-app-response

Specifies that the system passes a new connection based on the fastest response of all currently active nodes in a pool. This mode might be particularly useful in environments where nodes are distributed across different logical networks.

#### fastest-node

Specifies that the system passes a new connection based on the fastest response of all pools of which a server is a member. This mode might be particularly useful in environments where nodes are distributed across different logical networks.

#### least-connections-member

Specifies that the system passes a new connection to the node that has the least number of current connections in the pool. This mode works best in environments where the servers or other equipment you are load balancing have similar capabilities.

This dynamic load balancing mode distributes connections based on various aspects of real-time server performance analysis, such as the current number of connections per node or the fastest node response time.

#### least-connections-node

Specifies that the system passes a new connection to the node that has the least number of current connections out of all pools of which a node is a member. This mode works best in environments where the servers or other equipment you are load balancing have similar capabilities.

This dynamic load balancing mode distributes connections based on various aspects of real-time server performance analysis, such as the number of current connections per node, or the fastest node response time.

#### least-sessions

Specifies that the system passes a new connection to the node that has the least number of current sessions. This mode works best in environments where the servers or other equipment you are load balancing have similar capabilities.

This dynamic load balancing mode distributes connections based on various aspects of real-time server performance analysis, such as the number of current sessions.

#### observed-member

Specifies that the system ranks nodes based on the number of connections. Nodes that have a better balance of fewest connections receive a greater proportion of the connections.

This mode differs from the least-connections-member mode, which measures connections only at the moment of load balancing, while the observed-member mode tracks the number of Layer 4 connections to each node over time and creates a ratio for load balancing.

This dynamic load balancing mode works well in any environment, but may be particularly useful in environments where node performance varies significantly.

#### observed-node

Specifies that the system ranks nodes based on the number of connections. Nodes that have a better balance of fewest connections receive a greater proportion of the connections.

This mode differs from least-connections-node mode, which measures connections only at the moment of load balancing, while the observed-node mode tracks the number of Layer 4 connections to each node over time and creates a ratio for load balancing.

This dynamic load balancing method works well in any environment, but may be particularly useful in environments where node performance varies significantly.

#### predictive-member

Uses the ranking method used by the observed-member mode, except that the system analyzes the trend of the ranking over time, determining whether a node's performance is improving or declining. The nodes in the pool with better performance rankings that are currently improving, rather than declining, receive a higher proportion of the connections. This dynamic load balancing mode works well in any environment.

#### predictive-node

Uses the ranking method used by the observed-node mode, except that the system analyzes the trend of the ranking over time, determining whether a node's performance is improving or declining. The nodes in the pool with better performance rankings that are currently improving, rather than declining, receive a higher proportion of the connections. This dynamic load balancing mode works well in any environment.

#### queue-depth-limit

Specifies the maximum number of connections that may simultaneously be queued to go to any member of this pool. The default is zero which indicates there is no limit.

#### queue-on-connection-limit

Enable or disable queuing connections when pool member or node connection limits are reached. When queuing is not enabled, new connections are reset when connection limits are met. The default value is disabled.

#### queue-time-limit

Specifies the maximum time, in milliseconds, a connection will remain enqueued. The default is zero which indicates there is no limit.

#### ratio-least-connections-member

Specifies that the system weights connections to each pool member based on the value of the ratio weight defined for each pool member. If a ratio weight is unspecified, it will be treated as a default value of '1'.

#### ratio-least-connections-node

Specifies that the system weights connections to each pool member based on the value of the ratio weight defined for the pool member's node. If a ratio weight is unspecified, it will be treated as a default value of '1'.

#### ratio-member

Specifies that the number of connections that each machine receives over time is proportionate to a ratio weight you define for each machine within the pool.

#### ratio-node

Specifies that the number of connections that each machine receives over time is proportionate to a ratio weight you define for each machine across all pools of which the server is a member.

#### ratio-session

Specifies that the number of sessions that each machine receives over time is proportionate to a ratio weight that you define for each machine within the pool.

#### round-robin

Specifies that the system passes each new connection request to the next server in line, eventually distributing connections evenly across the array of machines being load balanced. This mode works well in most configurations, especially if the equipment that you are load balancing is roughly equal in processing speed and memory.

#### weighted-least-connections-member

Specifies that the system passes a new connection to the pool member that is handling the lowest percentage of the

specified maximum number of concurrent connections allowed. This mode works best in environments where the servers or other equipment you are load balancing have different but quantified capability limits.

This mode requires that you specify a value for the connection-limit option for all members of the pool, but does not require all servers or other equipment you are load balancing to have similar capabilities.

**weighted-least-connections-node**  
Specifies that the system passes a new connection to the node that is handling the lowest percentage of the specified connection limit. This mode works best in environments where the servers or other equipment you are load balancing have different but quantified capability limits.

This mode requires that you specify a value for the connection-limit option for all nodes, but does not require all servers or other equipment you are load balancing to have similar capabilities.

#### members

Adds, deletes, or replaces a set of pool members, by specifying a node name and service port in the format [node name/port]. If a node by the specified name does not exist, it will be created. You can configure the following options for a pool member:

#### address

Specifies the IP address of a pool member if a node by the name specified does not already exist.

#### app-service

Specifies the name of the application service to which the pool member belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the pool member. Only the application service can modify or delete the pool member.

#### connection-limit

Specifies the maximum number of concurrent connections allowed for a pool member. The default value is 0 (zero).

#### description

User defined description.

#### dynamic-ratio

Specifies a range of numbers that you want the system to use in conjunction with the ratio load balancing method. The default value is 1.

**fqdn** Specifies the attributes for defining a fully qualified domain name for the node.

**name** Specifies the fully-qualified domain name of the node.

#### address-family

Specifies whether the fqdn should consider IPv4, IPv6, or IP-agnostic address family.

#### autopopulate

Specifies whether a node defined by a fully-qualified domain name should automatically scale to the set of IP addresses returned by the DNS query. If disabled, only one ephemeral node is generated from the first IP address returned by DNS. The default is disabled.

#### interval

Specifies the interval to instantiate DNS queries on a fully-qualified domain name. The default is the TTL.

#### down-interval

Specifies the interval for the domain name resolution operation when a DNS query fails.

#### inherit-profile

Specifies whether the pool member inherits the encapsulation profile from the parent pool. The default value is enabled. If you disable inheritance, no encapsulation takes place, unless you specify another encapsulation profile for the pool member using the profiles attribute.

#### logging

Specifies whether the monitor applied should log its actions. Logs are stored in /var/log/monitors/ and are regularly rotated and compressed. The default value is disabled. This option isn't a part of configuration and will reset to disabled on load. This option doesn't sync.

#### monitor

Specifies the health monitors that are configured to monitor the pool member. The default value is default, the system monitors the pool member using the monitors specified for the pool.

You can specify:

- o A single monitor, for example, modify pool mypool members modify { pool\_member\_1:80 { monitor http } }.
- o Multiple monitors, for example, modify pool mypool members modify { pool\_member\_1:80 { monitor http and https } }.

- o A minimum number of monitors, for example, modify pool mypool members modify { pool\_member\_1:80 { monitor min 1 of { http https } } }.
- o No monitor rule or remove a monitor rule, for example, modify pool mypool members modify { pool\_member\_1:80 { monitor none } }.

#### profiles

Specifies the encapsulation profile to use for the pool member, when the inherit-profile attribute is disabled. The default value is none.

#### priority-group

Specifies the priority group within the pool for this pool member. Valid values are 0 through 65535. The system sends traffic to groups in order of priority. The default value is 0.

#### rate-limit

Specifies the maximum number of connections per second allowed for a pool member. The default value is 'disabled'.

#### ratio

Specifies the weight of the pool member for load balancing purposes. The default value is 1.

#### session

Establishing a session with a pool member is establishing the ability of the client to persist to the pool member when making new connections. When a pool member is session disabled, clients that have already established sessions with the pool member may create new connections, but a client that has not already established a session may not create a new one (or make a connection which would create a new session). This feature is used to gently drain connections from a node, typically as part of a maintenance operation. The default value is user-enabled.

The value of this property can be set by system or by user. If the value is set by system, the property will not be displayed in "Edit" command. But, users can add this field in if they need to modify this property. The values which user can set for this property are user-enabled and user-disabled.

#### state

user-down forces the pool member offline, overriding monitors. user-up reverts the user-down. When user-up, this displays the monitor state.

#### metadata

Associates user-defined data, each of which has name and value pair and persistence. The default value is persistent, which saves the data to the config file.

#### min-active-members

Specifies the minimum number of members that must be up for traffic to be confined to a priority group when using priority-based activation. The default value is 0 (zero). An active member is a member that is up (not marked down) and is handling fewer connections than its connection limit.

#### min-up-members

Specifies the minimum number of pool members that must be up; otherwise, the system takes the action specified in the min-up-members-action option.

Use this option for gateway pools in a redundant system where a unit number is applied to the pool. This indicates that the pool is configured only on the specified unit.

#### min-up-members-action

Specifies the action to take if min-up-members-checking is enabled, and the number of active pool members falls below the number specified in the min-up-members option. The default value is failover. The options are:

#### reboot

Specifies that when the min-up-members-checking option is enabled, and the number of active pool members is less than the number specified in the min-up-members option, the system restarts.

#### restart-all

Specifies that when the min-up-members-checking option is enabled, and the number of active pool members is less than the number specified in the min-up-members option, the system restarts.

#### failover

Specifies, for a redundant system, that when the min-up-members-checking option is enabled, and the number of active pool members is less than the number specified in the min-up-members option, the system fails over.

#### min-up-members-checking

Enables or disables the min-up-members feature. If you enable this feature, you must also specify a value for both the min-up-members and min-up-members-action options.

#### monitor

Specifies the health monitors that the system uses to determine whether it can use this pool for load balancing. The monitor marks

the pool up or down based on whether the monitor is successful.  
The default value is none.

You can specify:

- o A single monitor, for example, modify pool mypool monitor http.
- o Multiple monitors, for example, modify pool mypool monitor http and https.
- o A minimum number of monitors, for example, modify pool mypool monitor min 1 of {http and https}.
- o No monitor rule or remove a monitor rule, for example, modify pool mypool monitor none.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition  
Displays the administrative partition within which the pool resides.

profiles  
Specifies the profile to use for encapsulation. The default value is none, which indicates no encapsulation.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

reselect-tries  
When set to the default value of 0 (zero) the system does not attempt to load balance to another pool member after a passive failure. A passive failure is a pool member connection failure.

When set to any other value, the system attempts to load balance to another pool member after a passive failure, and if that attempt also results in a passive failure, the system repeats the process until the specified number of reselection tries is reached.

reset-stats  
Resets the statistics for the specified component to 0 (zero).

service-down-action  
Specifies the action to take if the service specified in the pool is marked down. The options are:

drop Specifies that the system drops connections when a the service is marked down.

none Specifies that the system takes no action when a the service is marked down. This is the default value.

reselect  
Specifies that the system reselects a node for the next packet that comes in on a Layer 4 connection, if the service of the existing connection is marked down.

reset  
Specifies that the system resets when a the service is marked down.

slow-ramp-time  
Specifies, in seconds, the ramp time for the pool. This provides the ability to cause a pool member that has just been enabled, or marked up, to receive proportionally less traffic than other members in the pool. The proportion of traffic the member accepts is determined by how long the member has been up in comparison to the value of the slow-ramp-time option for the pool.

For example, if the load-balancing-mode of a pool is round-robin and it has a slow-ramp-time of 60 seconds, when a pool member has been up for only 30 seconds, the pool member receives approximately half the amount of new traffic as other pool members that have been up for more than 60 seconds. After the pool member has been up for 45 seconds, it receives approximately three quarters of the new traffic.

The slow-ramp-time option is particularly useful when used with the least-connections-member load balancing mode. The default value is 10.

to-folder  
This is used with the mv command to specify a folder in which to move the pool and its members to.

Note: pools can be moved to any folder under /Common, but dependencies upon it may restrict moving it out of /Common.

DELETE
delete analytics [name]

DESCRIPTION
  Use the analytics component to create, modify, display, or delete an
  analytics profile for use with analytics functionality.

EXAMPLES
  create analytics my_analytics_profile defaults-from analytics

  Creates a custom analytics profile named my_analytics_profile that
  inherits its settings from the system default analytics profile.

  list analytics

  Displays the properties of all analytics profiles.

OPTIONS
  app-service
  Specifies the name of the application service to which the profile
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the profile. Only the application
  service can modify or delete the profile.

  alerts
  Adds, deletes, or replaces a set of analytics alerts. You can
  configure the following options for an analytics alert:

  app-service
  Specifies the name of the application service to which the
  alert belongs. The default value is none. Note: If the
  strict-updates option is enabled on the application service
  that owns the object, you cannot modify or delete the alert.
  Only the application service can modify or delete the alert.

  granularity
  Specifies a granularity level on which the alert is defined.

The options are:

  application
  Specifies that an alert is triggered for applications
  for which a threshold is breached.

  pool-member
  Specifies that an alert is triggered for pool members
  for which a threshold is breached.

  virtual-server
  Specifies that an alert is triggered for virtual servers
  for which a threshold is breached.

  metric
  Specifies a metric on which the alert is defined.

The options are:

  average-page-load-time
  Specifies that an alert is triggered when the average
  time it takes for the client to respond to a request
  breaches the defined threshold.

  average-request-throughput
  Specifies that an alert is triggered when the average
  number of bits per second the system processed, based on
  requests only, breaches the defined threshold.

  average-response-throughput
  Specifies that an alert is triggered when the average
  number of bits per second the system processed, based on
  responses only, breaches the defined threshold.

```

**average-server-latency**  
Specifies that an alert is triggered when the average time it takes for the web server to respond to a request breaches the defined threshold.

**average-tps**  
Specifies that an alert is triggered when the average number of transactions per second breaches the defined threshold.

**max-page-load-time**  
Specifies that an alert is triggered when the longest time it takes for the client to respond to a request breaches the defined threshold.

**max-request-throughput**  
Specifies that an alert is triggered when the maximum number of bits per second the system processed, based on requests only, breaches the defined threshold.

**max-response-throughput**  
Specifies that an alert is triggered when the maximum number of bits per second the system processed, based on requests only, breaches the defined threshold.

**max-server-latency**  
Specifies that an alert is triggered when the longest time it takes for the web server to respond to a request breaches the defined threshold.

**max-tps**  
Specifies that an alert is triggered when the largest number of transactions per second breaches the defined threshold.

**name** Specifies a unique name for an alert. This option is required for the commands create, delete, and modify.

**sample-period**  
Specifies that the alert metric is triggered when the conditions that trigger the alert last a defined amount of time, measured in seconds. The default value is 300.

**threshold**  
Specifies the threshold that must be breached in order for the system to generate alert.

**threshold-relation**  
Specifies whether the metric value must be below or above the metric.

The options are:

**above**  
Specifies that an alert is issued if metric current value is above the threshold.

**below**  
Specifies that an alert is issued if metric current value is below the threshold.

**captured-traffic-external-logging**  
Enables or disables the external logging of captured traffic.

**captured-traffic-internal-logging**  
Enables or disables the internal logging of captured traffic.

**collect-page-load-time**  
Enables or disables the collection of the page load time statistics. The page load time is the round-trip latency between client end-users and the servers, that is, the round-trip time between an end-user's request for a page until the time the response finishes loading.

**collect-geo**  
Enables or disables the collection of the names of the countries from where the traffic was sent.

**collect-http-throughput**  
Enables or disables the collection of throughput statistics. This property has been deprecated. As of v11.3.0, HTTP throughput is always collected.

**collect-http-timing-metrics**  
Enables or disables the collection of HTTP timing metrics.

**collect-ip**  
Enables or disables the collection of client IPs statistics.

**collect-max-tps-and-throughput**  
Enables or disables the collection of maximum TPS and throughput for all collected entities.

**collect-methods**  
Enables or disables the collection of HTTP methods statistics.

**collect-response-codes**  
Enables or disables the collection of response codes returned by the servers.

**collect-server-latency**  
Enables or disables the collection of server latency statistics. This property has been deprecated. As of v11.3.0, server latency

is always collected.

**collect-subnets**  
Enables or disables the collection of client side subnets.

**collect-url**  
Enables or disables the collection of requested URL statistics.

**collect-user-agent**  
Enables or disables the collection of user agents.

**collect-user-sessions**  
Enables or disables the collection of the unique user sessions.

**collected-stats-external-logging**  
Enables or disables the external logging of the collected statistics.

**collected-stats-internal-logging**  
Enables or disables the internal logging of the collected statistics.

**defaults-from**  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is analytics.

**description**  
User defined description.

**external-logging-publisher**  
Specifies the external logging publisher used to send statistical data to one or more destinations.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**notification-by-email**  
Enables or disables sending the analytics alerts by email.

**notification-by-snmp**  
Enables or disables sending the analytics alerts by SNMP traps. notification-by-syslog must be enabled.

**notification-by-syslog**  
Enables or disables logging of the analytics alerts into the Syslog.

**notification-email-addresses**  
Specifies which email addresses receive alerts by email when notification-by-email is enabled.

**partition**  
Displays the administrative partition within which the component resides.

**publish-irule-statistics**  
Enables or disables publishing analytics statistics for iRules.

**sampling**  
Enables or disables transaction sampling. This attribute can be set in the default profile only. The default value is disabled.

**session-cookie-security**  
Specifies the condition for adding a secure attribute to the session cookie. The options are:

**always**  
The secure attribute is always added to the session cookie.

**never**  
The secure attribute is never added to the session cookie.

**ssl-only**  
The secure attribute is only added to the session cookie when the virtual server has a client-SSL profile. This is the default value.

**session-timeout-minutes**  
Specifies the number of minutes of user non-activity before the system considers the session to be over.

**smtp-config**  
Specifies the SMTP configuration to be used with analytics.

**subnet-masks**  
Adds, deletes, or replaces predefined subnet addresses. This options defines the display names given to certain subnet addresses seen in the client IP subnets report.

**subnet**  
Subnet address. IPv4 addresses will be masked by 255.255.255.0. IPv6 addresses will be masked by ffff:ffff:ffff:ffff:: .

**traffic-capture**  
Adds, deletes, or replaces an analytics traffic capture definition. You can configure the following options for an analytics traffic capture:

**app-service**

Specifies the name of the application service to which the analytics traffic capture belongs. The default value is none.  
Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the analytics traffic capture. Only the application service can modify or delete the analytics traffic capture.

#### captured-protocols

Specifies whether the system captures traffic data sent using all protocols, or only one type of protocol.

The options are:

all Specifies that the system captures traffic data sent using all protocols.

http Specifies that the system captures traffic data sent using http protocol.

https Specifies that the system captures traffic data sent using https protocol.

#### client-ips

Adds, deletes, or replaces a set of client IP addresses from/to which captured traffic is sent.

#### dos-activity

Specifies whether the system captures traffic data mitigated by DoS Layer 7 Enforcer or regardless of DoS activity.

The options are:

any Specifies that system does not filter traffic data by DoS activity.

mitigated-by-dosl7 Specifies that the system captures only traffic data mitigated by DoS Layer 7 Enforcer.

#### methods

Adds, deletes, or replaces a set of HTTP methods used to send requests from which traffic is captured.

name Specifies a unique name for an analytics traffic capture. This option is required for the commands create, delete, and modify.

#### node-addresses

Adds, deletes, or replaces a set of node addresses from/to which captured traffic is sent.

#### request-captured-parts

Specifies what parts of the request data the system captures.

The options are:

all Specifies that the system captures all the parts of the request data.

body Specifies that the system captures the body of the request data.

#### headers

Specifies that the system captures the HTTP headers of the request data.

none Specifies that the system does not capture the request data.

#### request-content-filter-search-part

Specifies which part of the request is filtered by a specific string.

The options are:

all Specifies that the system filters all the parts of the request data.

body Specifies that the system filters the body of the request data.

#### headers

Specifies that the system filters the HTTP headers of the request data.

none Specifies that system does not filter the request data.

uri Specifies that the system filters the URI path component, including the query string, of the request data.

#### request-content-filter-search-string

Specifies the string by which a request data is filtered, or none.

#### response-captured-parts

Specifies what parts of the response data the system captures.

The options are:

all Specifies that the system captures all the parts of the response data.

body Specifies that the system captures the body of the response data.

headers Specifies that the system captures the HTTP headers of the response data.

none Specifies that the system does not capture the response data.

response-codes Adds, deletes, or replaces a set of HTTP response codes from which traffic is captured.

response-content-filter-search-part Specifies which part of the response is filtered by a specific string.

The options are:

all Specifies that the system filters all the parts of the response data.

body Specifies that the system filters the body of the response data.

headers Specifies that the system filters the HTTP headers of the response data.

none Specifies that system does not filter the response data.

response-content-filter-search-string Specifies the string by which the response data is filtered, or none.

url-path-prefixes Adds, deletes, or replaces a set of URL path prefixes on which traffic can be captured (both to and from).

user-agent-substrings Adds, deletes, or replaces a set of user agent substrings on which traffic can be captured (both to and from).

virtual-servers Adds, deletes, or replaces a set of virtual servers from/to which captured traffic is sent.

## ltm profile certificate-authority

**NAME**  
certificate-authority - Defines the settings necessary to authenticate the client certificate.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the certificate-authority within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create certificate-authority [name]  
modify certificate-authority [name]  
options:  
  authenticate-depth  
  ca-file  
  crl-file  
  default-name  
  description  
  update-crl

edit certificate-authority [ [name] | [glob] | [regex] ] ... ]  
options:

all-properties  
non-default-properties

#### DISPLAY

```
list certificate-authority
list certificate-authority [ [name] | [glob] | [regex] ] ... ]
app-service
partition
```

```
show certificate-authority
show certificate-authority [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
field-fmt
non-default-properties
one-line
```

#### DESCRIPTION

Use the certificate-authority component to modify or display a certificate-authority profile.

#### EXAMPLES

```
create ltm profile certificate-authority mycaprofile { ca-file ca.crt }
```

Creates a certificate authority profile named mycaprofile using the system defaults.

```
modify ltm profile certificate-authority mycaprofile { authenticate-
depth 3 }
```

Modifies the authenticate-depth setting to 3 for the certificate authority profile named mycaprofile.

#### OPTIONS

app-service

Displays the application service to which the object belongs. The default value is none.

Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

authenticate-depth

Specifies the authenticate depth. This is the client certificate chain maximum traversal depth.

ca-file

Specifies the certificate authority file name or, you can use default for the default certificate authority file name. Configures certificate verification by specifying a list of client or server certificate authorities that the traffic management system trusts.

crl-file

Specifies the certificate revocation list file name. You can use default for the default certificate revocation file name.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified.

description

User defined description.

name Specifies the profile instance name. This option is required for the modify command.

partition

Specifies the administrative partition within which the profile resides.

regex

Specifies the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

update-crl

Automatically updates the CRL file.

#### SEE ALSO

edit, glob, list, modify, regex, show, tmsh,

# ltm profile classification

**NAME**  
classification - Configures a classification profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the classification profile within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create classification [name]  
modify classification [name]  
options:  
  defaults-from [ [name] | none]  
  description [string]  
  app-detection [ on | off]  
  urlcat [ on | off]  
  irule-event [ on | off]  
  log-publisher [string]  
  preset [string]

edit classification [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list classification  
list classification [ [ [name] | [glob] | [regex] ] ... ]  
show running-config classification  
show running-config classification [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition

**DELETE**  
delete classification [name]

**DESCRIPTION**  
Use the classification component to create, modify, delete or display a classification profile.

**EXAMPLES**  
create classification my\_cl { irule-event off preset /Common/ce }  
  
Creates classification profile named my\_cl with Classification Engine configuration /Common/ce and iRule event disabled.  
  
edit classification my\_cl  
  
Edits the classification profile named my\_cl.  
  
list classification my\_cl  
  
Displays the properties of the my\_cl classification profile.  
  
delete classification my\_cl  
  
Deletes the my\_cl classification profile.

**OPTIONS**  
description  
User defined description.  
  
app-detection  
Enables / Disables Application Detection feature.  
  
urlcat  
Enables / Disables URL categorization feature.  
  
irule-event  
Enables / disables CLASSIFICATION\_DETECTED iRule event generation.  
  
log-publisher  
Specifies the log publisher name  
  
preset  
Specifies Classification Engine configuration. Refer to ltm classification ce for more details

**SEE ALSO**  
edit, list, ltm virtual, ltm classification, ltm classification ce, modify, regex, reset-stats, show, tmsh

## ltm profile client-ldap

**NAME**  
client-ldap - Configures an Client LDAP profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the client-ldap component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create client-ldap [name]  
modify client-ldap [name]  
options:  
  app-service [[string] | none]  
  defaults-from [ [name] | none]  
  description [string]  
  activation-mode [ none | allow | require ]

edit client-ldap [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list client-ldap  
list client-ldap [ [ [name] | [glob] | [regex] ] ... ]  
show running-config client-ldap  
show running-config client-ldap [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DELETE**  
delete client-ldap [name]

**DESCRIPTION**  
You can use the client-ldap component to create, modify, display, or delete an Client LDAP profile with which you can manage Client LDAP traffic.

**EXAMPLES**  
create client-ldap my\_clientldap\_profile defaults-from clientldap  
  
Creates a custom Client LDAP profile named my\_clientldap\_profile that inherits its settings from the system default Client LDAP profile.  
  
list client-ldap  
  
Displays the properties of all Client LDAP profiles.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.  
  
defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is smtp.  
  
description  
User defined description.  
  
glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.  
  
name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.  
  
regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.  
  
activation-mode  
Sets the activation-mode STARTTLS. The options are NONE, ALLOW, or REQUIRE. The default value is REQUIRE.

**SEE ALSO**  
create, delete, edit, glob, list, ltm virtual, modify, regex, reset-stats, show, sys provision, tmsh

DELETE
delete client-ssl [all | [name]]
options:
  recursive

DESCRIPTION
  You can use the client-ssl component to create, modify, or delete a
  custom Client SSL profile, or display a custom or default Client SSL
  profile.

  Client-side profiles allow the traffic management system to handle
  authentication and encryption tasks for any SSL connection coming into
  a traffic management system from a client system.

EXAMPLES
create client-ssl my_clientssl_profile

Creates a clientssl profile named my_clientssl_profile using the system
defaults.

create clientssl my_clientssl_profile authenticate-depth number

Creates a Client SSL profile named my_clientssl_profile using the
system defaults, except that a user is authenticated with depth number.

mv client-ssl /Common/my_client-ssl_profile to-folder /Common/my_folder

Moves a custom client-ssl profile named my_client-ssl_profile to a
folder named my_folder, where my_folder has already been created and
exists within /Common. =head1 OPTIONS

alert-timeout
Specifies the maximum time period in seconds to keep the SSL
session active after alert message is sent, or indefinite. The
default value is indefinite.

allow-non-ssl
Enables or disables non-SSL connections. Specify enabled when you
want non-SSL connections to pass through the traffic management
system as clear text. The default value is disabled.

allow-dynamic-record-sizing

```

Enables or disables dynamic application record sizing. Specify enabled when you want to allow dynamic record sizing. The default value is disabled.

#### app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

#### authenticate

Specifies how often the system authenticates a user. The default value is once.

#### authenticate-depth

Specifies the authenticate depth. This is the client certificate chain maximum traversal depth. The default value is 9.

#### bypass-on-client-cert-fail

Enables or disables SSL forward proxy bypass on failing to get client certificate that server asks for. When enabled and the SSL handshake cannot be completed because of failure to get the client certificate, SSL traffic bypasses the BIG-IP system untouched, without decryption/encryption. The default value is disabled. Conversely, you can specify enabled to use this feature.

#### bypass-on-handshake-alert

Enables or disables SSL forward proxy bypass on receiving handshake failure, protocol version or unsupported extension alert message during the serverside SSL handshake. When enabled and there is an SSL handshake\_failure, protocol\_version or unsupported\_extension alert during the serverside SSL handshake, SSL traffic bypasses the BIG-IP system untouched, without decryption/encryption. The default value is disabled. Conversely, you can specify enabled to use this feature.

#### ca-file

Specifies the certificate authority (CA) file name. Configures certificate verification by specifying a list of client or server CAs that the traffic management system trusts. The default value is none.

#### cache-size

Specifies the SSL session cache size. For client-side profiles only, you can configure timeout and size values for the SSL session cache. Because each profile maintains a separate SSL session cache, you can configure the values on a per-profile basis. The default value is 262144.

#### cache-timeout

Specifies the SSL session cache timeout value. This specifies the number of usable lifetime seconds of negotiated SSL session IDs. The default value is 3600 seconds. Acceptable values are integers greater than or equal to 0 and less than or equal to 86400.

cert This option is deprecated and is maintained here for backward compatibility reasons. Please check cert-key-chain option to add certificate, key, passphrase and chain to the profile.

#### cert-extension-includes

Specifies the extensions of the web server certificates to be included in the generated certificates using SSL Forward Proxy. For example, { basic-constraints }. The default value is none. The extensions are:

#### authority-key-identifier

Authority Key Identifier provides a means of identifying the public key corresponding to the private key used to sign a certificate.

#### basic-constraints

Basic Constraints are used to indicate whether the certificate belongs to a CA.

#### certificate-policies

Certificate Policies contain a sequence of one or more policy information terms.

#### crl-distribution-points

CRL Distribution Points identify how CRL information is obtained.

#### destination-ip-blacklist

Specifies the data group name of destination ip blacklist when SSL forward proxy bypass feature is enabled.

#### destination-ip-whitelist

Specifies the data group name of destination ip whitelist when SSL forward proxy bypass feature is enabled.

#### extended-key-usage

Extended Key Usage is used, typically on a leaf certificate, to indicate the purpose of the public key contained in the certificate.

#### forward-proxy-bypass-default-action

Specifies the SSL forward proxy bypass default action. The default option is intercept.

#### fresh-crl

Fresh CRL (a.k.a Delta CRL Distribution Point) identifies how delta CRL information is obtained.

#### hostname-blacklist

Specifies the data group name of hostname blacklist when SSL forward proxy bypass feature is enabled.

#### hostname-whitelist

Specifies the data group name of hostname whitelist when SSL forward proxy bypass feature is enabled.

#### inherit-certkeychain

This is read only value used internally.

#### issuer-alternative-name

As with subject-alternative-name, Issuer Alternative Name is used to associate Internet style identities with the certificate issuer.

#### key-usage

Key Usage provides a bitmap specifying the cryptographic operations which may be performed using the public key contained in the certificate; for example, it could indicate that the key should be used for signature but not for encipherment.

#### subject-alternative-name

Subject Alternative Name allows identities to be bound to the subject of the certificate. These identities may be included in addition to or in place of the identity in the subject field of the certificate.

#### subject-directory-attributes

Subject Directory Attributes are used to convey identification attributes (for example, nationality) of the subject.

#### subject-key-identifier

Subject Key Identifier provides a means of identifying certificates that contains a particular public key.

#### cert-key-chain

Adds, deletes, or replaces a set of certificate, key, passphrase, chain. client-ssl profile requires at least one cert/key pair to work. Multiple cert/key types can be associated to a client-ssl profile using following options:

**cert** Specifies the name of the certificate installed on the traffic management system for the purpose of terminating or initiating an SSL connection. You can specify the default certificate name, which is default.crt.

#### chain

Specifies or builds a certificate chain file that a client can use to authenticate the profile. The default value is none.

**key** Specifies the name of a key file that you generated and installed on the system. When selecting this option, type a key file name or use the default value default.key.

#### passphrase

Specifies the key passphrase, if required. The default value is none.

#### cert-lifespan

Specifies the lifespan of the certificate generated using the SSL forward proxy feature. The default value is 30.

#### cert-lookup-by-ipaddr-port

Specifies whether to perform certificate look up by IP address and port number.

#### chain

This option is deprecated and is maintained here for backward compatibility reasons. Please check cert-key-chain option to add certificate, key, passphrase and chain to the profile.

#### cipher-group

Specifies a cipher group. If the cipher group is not blank or none, the ciphers string will be used.

#### ciphers

Specifies a cipher name. The default value is DEFAULT, which uses the default ciphers.

#### client-cert-ca

Specifies the client cert certificate authority name. The default value is none.

#### crl-file

Specifies the certificate revocation list file name. The default value is none.

#### allow-expired-crl

Use the specified CRL file even if it has expired. The default value is disabled.

#### defaults-from

This setting specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is clientssl.

#### description

User defined description.

**glob** Displays the items that match the glob expression. See help glob

for a description of glob expression syntax.

**handshake-timeout**  
Specifies the handshake timeout in seconds. The default value is 10 seconds.

**key** This option is deprecated and is maintained here for backward compatibility reasons. Please check cert-key-chain option to add certificate, key, passphrase and chain to the profile.

**maximum-record-size**  
Specifies the profile's maximum record size. The range is 128 - 16384. The default value is 16384.

**mod-ssl-methods**  
Enables or disables ModSSL method emulation. Enable this option when OpenSSL methods are inadequate, for example, when you want to use SSL compression over TLSv1. The default value is disabled.

**mode** Specifies the profile mode, which enables or disables SSL processing. The default value is enabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**options**  
Enables options, including some industry-related workarounds. Enter options inside braces, for example, {dont-insert-empty-fragments microsoft-sess-id-bug}.

The default value is dont-insert-empty-fragments. The options are:

**all-bugfixes**

This option enables the following industry-related defect workarounds: microsoft-sess-id-bug, netscape-challenge-bug, netscape-reuse-cipher-change-bug, sslref2-reuse-cert-type-bug, microsoft-big-ssl3-buffer, msie-ssl2-rsa-padding, ssleay-080-client-dh-bug, tls-d5-bug, tls-block-padding-bug, and dont-insert-empty-fragments.

It is usually safe to use this option to enable the defect workaround options when compatibility with broken implementations is desired. It is usually safe to use this option to enable the defect workaround options when compatibility with broken implementations is desired. Note that if you edit the configuration in the Web-based configuration utility, the system expands the all-bugfixes syntax into each individual option.

**cipher-server-preference**

When choosing a cipher, this option uses the server's preferences instead of the client references. If this option was not set, the SSL server would follow the client's references. When this option is set, the SSLv3/TLSv1 server chooses by using its own references.

Note: This option has no effect. The BIG-IP system always behaves as if the option is active, even when you disable it.

**dont-insert-empty-fragments**

Disables a countermeasure against an SSL 3.0/TLS 1.0 protocol vulnerability affecting CBC ciphers. These ciphers cannot be handled by certain broken SSL implementations. This option has no effect for connections using other ciphers.

**ephemeral-rsa**

Uses ephemeral (temporary) RSA keys when doing RSA operations. According to the specifications, this is done only when an RSA key can be used for signature operations only (namely under export ciphers with restricted RSA key length). By setting this option, you specify that you want to use ephemeral RSA keys always. This option breaks compatibility with the SSL/TLS specifications and may lead to interoperability problems with clients. Therefore, F5 Networks does not recommend this option. Use ciphers with ephemeral Diffie-Hellman (EDH) key exchange instead. This option is ignored for server-side SSL.

**microsoft-big-ssl3-buffer**

Enables a workaround for communicating with older Microsoft(r) applications that use non-standard SSL record sizes.

**microsoft-sess-id-bug**

Handles a Microsoft session ID problem.

**msie-ssl2-rsa-padding**

Enables a workaround for communicating with older Microsoft applications that use non-standard RSA key padding. This option is ignored for server-side SSL.

**netscape-ca-dn-bug**

Handles a defect regarding the system crashing or hanging. If the system accepts a Netscape Navigator(r) browser connection, demands a client cert, has a non-self-signed CA that does not have its CA in Netscape, and the browser has a certificate, the system crashes or hangs.

**netscape-challenge-bug**

Handles the Netscape challenge problem.

**netscape-demo-cipher-change-bug**

Manipulates the SSL server session resumption behavior to mimic that of certain Netscape servers (see the Netscape

reuse cipher change bug workaround description). Note that F5 Networks does not recommend this option for normal use. It is ignored for server-side SSL.

**netscape-reuse-cipher-change-bug**  
Handles a defect within Netscape-Enterprise/2.01 (<https://merchant.neape.com>), only appearing when connecting through SSLv2/v3 then reconnecting through SSLv3. In this case, the cipher list changes.

First, a connection is established with the RC4-MD5 cipher list. If it is then resumed, the connection switches to using the DES-CBC3-SHA cipher list. However, according to RFC 2246, (section 7.4.1.3, cipher suite) the cipher list should remain RC4-MD5.

As a workaround, you can attempt to connect with a cipher list of DES-CBC-SHA:RC4-MD5 and so on. For some reason, each new connection uses the RC4-MD5 cipher list, but any reconnection attempts to use the DES-CBC-SHA cipher list. Thus Netscape, when reconnecting, always uses the first cipher in the cipher list.

**no-session-resumption-on-renegotiation**  
When performing renegotiation as an SSL server, this option always starts a new session (that is, session resumption requests are only accepted in the initial handshake). The system ignores this option for server-side SSL.

**no-ssl**  
Do not use any version of the SSL protocol.

**no-sslv2**  
Do not use the SSLv2 protocol.

**no-sslv3**  
Do not use the SSLv3 protocol.

**no-tls**  
Do not use any version of the TLS protocol.

**no-tls1**  
Do not use the TLSv1.0 protocol.

**no-tls1.1**  
Do not use the TLSv1.1 protocol.

**no-tls1.2**  
Do not use the TLSv1.2 protocol.

**no-dtls**  
Do not use any version of the DTLS protocol.

**passive-close**  
Specifies how to handle passive closes.

**none** Disables all workarounds. Note that F5 Networks does not recommend this option.

**notify-cert-status-to-virtual-server**  
Specifies whether to propagate the status of the certificates of this clientssl profile to the virtual servers that are using this clientssl profile.

**ocsp-stapling**  
Specifies whether to enable OCSP stapling.

**pkcs1-check-1**  
This debugging option deliberately manipulates the PKCS1 padding used by SSL clients in an attempt to detect vulnerability to particular SSL server vulnerabilities. Note that F5 Networks does not recommend this option for normal use. The system ignores this option for client-side SSL.

**pkcs1-check-2**  
This debugging option deliberately manipulates the PKCS1 padding used by SSL clients in an attempt to detect vulnerability to particular SSL server vulnerabilities. Note that F5 Networks does not recommend this option for normal use. The system ignores this option for client-side SSL.

**single-dh-use**  
Creates a new key when using temporary/ephemeral DH parameters. This option must be used to prevent small subgroup attacks, when the DH parameters were not generated using strong primes (for example, when using DSA-parameters). If strong primes were used, it is not strictly necessary to generate a new DH key during each handshake, but F5 Networks recommends it. Enable the Single DH Use option whenever temporary or ephemeral DH parameters are used.

**ssleay-080-client-dh-bug**  
Enables a workaround for communicating with older SSLeay-based applications that specify an incorrect Diffie-Hellman public value length. This option is ignored for server-side SSL.

**sslref2-reuse-cert-type-bug**  
Handles the SSL reuse certificate type problem.

**tls-block-padding-bug**  
Enables a workaround for communicating with older TLSv1-enabled applications that use incorrect block padding.

#### tls-d5-bug

This option is a workaround for communicating with older TLSv1-enabled applications that specify an incorrect encrypted RSA key length. This option is ignored for server-side SSL.

#### tls-rollback-bug

Disables version rollback attack detection. During the client key exchange, the client must send the same information about acceptable SSL/TLS protocol levels as it sends during the first hello. Some clients violate this rule by adapting to the server's answer. For example, the client sends an SSLv2 hello and accepts up to SSLv3.1 (TLSv1), but the server only processes up to SSLv3. In this case, the client must still use the same SSLv3.1 (TLSv1) announcement. Some clients step down to SSLv3 with respect to the server's answer and violate the version rollback protection. The system ignores this option for server-side SSL.

#### partition

Displays the administrative partition within which the profile resides.

#### passphrase

This option is deprecated and is maintained here for backward compatibility reasons. Please check cert-key-chain option to add certificate, key, passphrase and chain to the profile.

#### peer-cert-mode

Specifies the peer certificate mode. The default value is ignore.

peer-no-renegotiate-timeout Specifies the timeout in seconds when the server sends Hello Request and waits for ClientHello before it sends Alert with fatal alert. You can also specify indefinite. The default is 10 seconds.

#### proxy-ca-cert

Specifies the name of the certificate file that is used as the certification authority certificate when SSL forward proxy feature is enabled. The certificate should be generated and installed by you on the system. When selecting this option, type a certificate file name.

#### proxy-ca-key

Specifies the name of the key file that is used as the certification authority key when SSL forward proxy feature is enabled. The key should be generated and installed by you on the system. When selecting this option, type a key file name.

#### proxy-ca-passphrase

Specifies the passphrase of the key file that is used as the certification authority key when SSL forward proxy feature is enabled. When selecting this option, type the passphrase corresponding to the selected proxy-ca-key.

#### proxy-ssl

Enabling this option requires a corresponding server ssl profile with proxy-ssl enabled to perform transparent SSL decryption. This allows further modification of application traffic within an SSL tunnel while still allowing the server to perform necessary authorization, authentication, auditing steps.

#### proxy-ssl-passthrough

Enabling this option requires a corresponding server ssl profile with proxy-ssl-passthrough enabled. This allows Proxy SSL to passthrough the traffic when ciphersuite negotiated between the client and server is not supported. The default option is disabled.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### renegotiate-max-record-delay

Specifies the maximum number of SSL records that the traffic management system can receive before it renegotiates an SSL session. After the system receives this number of SSL records, it closes the connection. This setting applies to client profiles only. The default value is indefinite.

#### renegotiate-period

Specifies the number of seconds required to renegotiate an SSL session. The default value is indefinite.

#### renegotiate-size

Specifies the size of the application data, in megabytes, that is transmitted over the secure channel. If the size of the data is higher than this value, the traffic management system must renegotiate the SSL session. The default value is indefinite.

#### renegotiation

Specifies whether renegotiations are enabled. The default value is enabled. When renegotiations are disabled, and the system is acting as an SSL server, and a COMPAT or NATIVE cipher is negotiated, the system will abort the connection. Additionally, when renegotiations are disabled, and the system is acting as an SSL client, the system will ignore the server's HelloRequest messages.

#### retain-certificate

APM module requires storing certificate in SSL session. When set to false, certificate will not be stored in SSL session. The default value is true.

#### generic-alert

Enables or disables generic-alert. The default option is enabled, which causes the SSL profile to use generic alert number. Conversely, you can specify disabled to cause SSL profile to use alert number defined in RFC5246/RFC6066 strictly.

#### secure-renegotiation

Specifies the secure renegotiation mode. The default value is require. When secure renegotiation is required, any client attempting to renegotiate that does not support secure renegotiation will have its connection aborted. When secure renegotiation is set to require-strict, any client attempting to connect that does not support secure renegotiation will have its initial handshake denied. When secure renegotiation is set to request, unpatched clients will be permitted to renegotiate. This setting is NOT recommended however, as it is subject to active man-in-the-middle attacks.

#### max-renegotiations-per-minute

Specifies the maximum number of renegotiation attempts allowed in a minute. The default value is 5.

#### max-active-handshakes

Specifies the maximum number allowed SSL active handshakes. The default value is 0.

#### max-aggregate-renegotiation-per-minute

Specifies the maximum number of aggregate renegotiation attempts allowed in a minute. The default value is indefinite.

#### server-name

Specifies the server names to be matched with SNI (server name indication) extension information in ClientHello from a client connection. Wildcard is supported by using wildcard character "\*" to match multiple names.

#### sni-default

When true, this profile is the default SSL profile when the server name in a client connection does not match any configured server names, or a client connection does not specify any server name at all.

#### sni-require

When this option is enabled, a client connection that does not specify a known server name or does not support SNI extension will be rejected.

#### ssl-sign-hash

Specifies SSL sign hash algorithm which is used to sign and verify SSL Server Key Exchange and Certificate Verify messages for the specified SSL profiles. The default value is sha1.

#### strict-resume

Enables or disables strict-resume. The default option is disabled, which causes the SSL profile to resume an uncleanly shut down SSL session. Conversely, you can specify enabled to prevent an SSL session from being resumed after an unclean shutdown.

#### unclean-shutdown

By default, the SSL profile performs unclean shutdowns of all SSL connections, which means that underlying TCP connections are closed without exchanging the required SSL shutdown alerts. If you want to force the SSL profile to perform a clean shutdown of all SSL connections, set this option to disabled.

#### session-mirroring

Enables or disables the mirroring of sessions to high availability peer. By default, this setting is disabled, which causes the system to not mirror ssl sessions.

#### session-ticket

Enables or disables session-ticket. The default option is disabled, which causes the SSL profile not to use session ticket per RFC 5077. Conversely, you can specify enabled to cause SSL profile to use session ticket per RFC 5077.

#### session-ticket-timeout

Specifies the session ticket timeout. The default value is 0 which means cache timeout is used.

#### source-ip-blacklist

Specifies the data group name of source ip blacklist when SSL forward proxy bypass feature is enabled.

#### source-ip-whitelist

Specifies the data group name of source ip whitelist when SSL forward proxy bypass feature is enabled.

#### ssl-forward-proxy

Enables or disables SSL forward proxy feature. The default option is disabled. Conversely, you can specify enabled to use the SSL Forward Proxy Feature.

#### ssl-forward-proxy-bypass

Enables or disables SSL forward proxy bypass feature. The default option is disabled. Conversely, you can specify enabled to use the SSL Forward Proxy Bypass Feature.

#### to-folder

client-ssl profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

## ltm profile dhcpv4

**NAME**

DHCPv4 - Configures a Dynamic Host Configuration Protocol (DHCP) profile.

**MODULE**

ltm profile

**SYNTAX**

Configure the dhcpv4 profile within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**

```
create dhcpv4 [name]
modify dhcpv4 [name]
options:
  app-service [[string] | none]
  defaults-from [[name] | none]
  mode [relay | forwarding]
  description [string]
  idle-timeout [ [integer] | indefinite ]
  default-lease-time [integer]
  transaction-timeout [integer]
  authentication {
    options:
  enabled [true | false]
  virtual [[string] | none]
  user-name {
    options:
    format [mac-address | mac-and-relay-option | relay-option | tcl-snippet]
    suboption-id1 [integer]
    suboption-id2 [integer]
    separator1 [[string] | none]
    separator2 [[string] | none]
    tcl [[string] | none]
  }
  subscriber-discovery {
    options:
  enabled [true | false]
  subscriber-id {
    options:
    format [mac-address | mac-and-relay-id | tcl-snippet]
    suboption-id1 [integer]
    suboption-id2 [integer]
    separator1 [[string] | none]
    separator2 [[string] | none]
    tcl [[string] | none]
  }
  }
  relay-agent-id {
    options:
  add [true | false]
  remove [true | false]
  suboption {
    options:
    id1 [integer]
    id2 [integer]
    value1 [string | none]
    value2 [string | none]
  }
  }
  ttl-value [integer]
  ttl-dec-value [ by-0 | by-1 | by-2 | by-4 ]
  max-hops [integer]

edit dhcpv4 [ [name] ... ]
options:
  all-properties
  non-default-properties

reset-stats dhcpv4
reset-stats dhcpv4 [ [ [name] | [regex] ] ... ]
```

```

DISPLAY
list dhcpv4
list dhcpv4 [ [name] | [regex] ] ... ]
show running-config dhcpv4
show running-config dhcpv4
  [ [name] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show dhcpv4
show dhcpv4 [ [name] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global

DELETE
delete dhcpv4 [name]

```

#### DESCRIPTION

You can use the dhcpv4 profile to manage DHCPv4 network traffic.

#### EXAMPLES

```
create dhcpv4 my_dhcpv4_profile defaults-from dhcpv4
```

Creates a custom DHCPv4 profile named my\_dhcpv4\_profile that inherits its settings from the system default DHCPv4 profile.

```
list dhcpv4 all-properties
```

Displays all properties for all DHCPv4 profiles.

```

create dhcpv4 new_dhcpv4_profile {
mode relay
idle-timeout 120
transaction-timeout 45
default-lease-time 3600
ttl-value 0
ttl-dec-value by-2
max-hops 4
subscriber-discovery {
  enabled true
  subscriber-id {
format mac-and-relay-option
suboption-id1 1
separator1 -
  }
}
authentication {
  enabled true
  virtual new_authen_vs
  user-name {
format mac-and-relay-option
suboption-id1 1
separator1 -
  }
}
relay-agent-id {
  add false
  remove true
}
}

```

Creates a DHCPv4 profile named new\_dhcpv4\_profile with idle-timeout value of <120 seconds>, transaction-timeout of <45 seconds>, default-lease-time of 3600 seconds, ttl-dec-value of 2 and max-hops of 4. The BIG-IP virtual will work in relay mode, with subscriber discovery enabled and configured with the subscriber-id format set to mac-and-relay-option and configured to use only suboption 1 (the first suboption ID) of the relay-agent info option (option 82) and to use the - to concatenate the MAC address to the first suboption ID. The authentication is enabled and its user-name equals the subscriber-id and the authentication virtual name is new\_authen\_vs. It also does not add relay agent option 82 but removed it (if exists) from the server-to-client messages.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

default-lease-time

Provides the default value in seconds of DHCPv4 lease time in case it was missing in the client-server exchange. The default is 86400.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile. The default value is dhcpv4.

description

User defined description.

mode Specifies the operation mode of the DHCP virtual. If the virtual to run in relay mode, then it means that it is acting as a standard DHCPv4 relay agent. This means that the relay will change some of the DHCPv4 packet fields before sending it to either the client or server. The forwarding mode is similar to relay except

that the virtual will not modify the standard fields, instead it will forward the message from client to server and vice-versa. The default is relay.

idle-timeout

Specifies the number of seconds that a connection is idle before the connection is eligible for deletion. The default value is 60 seconds.

transaction-timeout

Specifies DHCPv4 transaction timeout, in seconds. The transactions should complete within the timeout specified. If a transaction does not complete for any reason, it is removed. The default value is 45 seconds.

authentication

Manages the subscriber authentication attributes.

enabled

To enable or disable subscriber authentication. If enabled, then user has to fill the following fields. Default is false.

virtual

Specifies the authentication virtual server name.

user-name

Manages the authentication user name's attributes. The user-name is what will be used to authenticate the DHCP client.

format

Specifies the user-name format. The options are: MAC address, MAC + relay-agent option, relay-agent option or tcl-snippet. The concatenation symbol is defined as separator1.

suboption-id1

The relay-agent option (option 82) first suboption ID. The default is 1.

suboption-id2

The relay-agent option (option 82) second suboption ID. The default is 2.

separator1

A string that is used to concatenate the MAC address and the relay-agent info option (option 82) to create the authentication user-name. The default is @.

separator2

A string that is used to concatenate the relay-agent info option (option 82) suboptions 1 and 2 to create the authentication user-name. The default is @.

tcl-snippet

A tcl snippet to format the user name. This value will be taken into account only if the format value was chosen to be tcl-snippet.

subscriber-discovery

Manages the subscriber discovery attributes.

enabled

To enable or disable subscriber discovery. If enabled, then user has to fill the following fields. Default is false.

subscriber-id

Manages the subscriber-id attributes. The subscriber-id is used by SPM to create, delete and update subscriber sessions.

format

Specifies the subscriber-id format. The options are: MAC address, MAC + relay-agent option, relay-agent option or tcl-snippet. The concatenation symbol is defined as separator1.

suboption-id1

The relay-agent info option (option 82) first suboption ID. The default is 1.

suboption-id2

The relay-agent info option (option 82) second suboption ID. The default is 2.

separator1

A string that is used to concatenate the MAC address and the relay-agent info option (option 82) to create the subscriber-id. The default is @.

separator2

A string that is used to concatenate the relay-agent info option (option 82) suboptions 1 and 2 to create the subscriber-id. The default is @.

tcl-snippet

A tcl snippet to format the subscriber-id. This value will be taken into account only if the format value was chosen to be tcl-snippet.

relay-agent-id

Manages the relay agent information option (option 82) attributes. As a relay, the DHCP virtual can insert this option.

add Specifies if the user wants the DHCP relay agent to insert option 82 or not. Default is false.

remove  
Specifies if the user wants the DHCP relay agent to remove option 82 from the server-to-client traffic or not. Default is false.

suboptions  
Manages the inserted relay agent information option (option 82) suboptions. We allow only two suboptions to be inserted.

id1 An integer to represent the first suboption ID. Default is 1.

value1  
A string to represent the first suboption value.

id2 An integer to represent the second suboption ID. Default is 2.

value2  
A string to represent the second suboption value.

ttl-value  
Specifies the ttl absolute value that the user may want to set for each outgoing DHCP packet. Default is 0; and in this case, we use the ttl-dec-value field.

ttl-dec-value  
Specifies the amount that the DHCP virtual will use to decrement the ttl for each outgoing DHCP packet. Default is by-1.

max-hops  
Specifies the maximum number of relay agents that the DHCPv4 messages pass through before they are discarded. The default is 4.

  global

DELETE
delete dhcpv6 [name]

DESCRIPTION
  You can use the dhcpv6 profile to manage DHCPv6 network traffic.

EXAMPLES
  create dhcpv6 my_dhcpv6_profile defaults-from dhcpv6

  Creates a custom DHCPv6 profile named my_dhcpv6_profile that inherits
  its settings from the system default DHCPv6 profile.

  list dhcpv6 all-properties

  Displays all properties for all DHCPv6 profiles.

  create dhcpv6 new_dhcpv6_profile {
mode relay
idle-timeout 120
transaction-timeout 45
default-lease-time 3600
subscriber-discovery {
  enabled true
  subscriber-id {
format mac-and-option37
separator1 @
}
}
authentication {
  enabled true
  virtual new_authen_vs
  user-name {
format mac-and-option37
separator1 @
}
}
remote-id-option {
  add false
  remove true
}
subscriber-id-option {
  add false
  remove true
}
} }

  Creates a DHCPv6 profile named new_dhcpv6_profile with idle-timeout
  value of <120 seconds>, transaction-time out of <45 seconds> and
  default-lease-time of 3600 seconds. The BIG-IP virtual will work in
  relay mode, with subscriber discovery enabled and configured with the
  subscriber-id format set to mac-and-option37 (remote-id relay agent
  option) and to use the @ to concatenate both MAC address and option 37.
  The authentication is enabled and its user-name equals the subscriber-
  id and the authentication virtual name is new_authen_vs. It also does
  not add either option 37 or options 38 (remote-id option and
  subscriber-id option) but remove them (if exists) from the server-to-
  client messages.

```

#### OPTIONS

#### app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

#### default-lease-time

Provides the default value in seconds of DHCPv6 lease time in case it was missing in the client-server exchange. The default is 86400.

#### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile. The default value is dhcpv6.

#### description

User defined description.

**mode** Specifies the operation mode of the DHCP virtual. If the virtual to run in relay mode, then it means that it is acting as a standard DHCPv6 relay agent. This means that the relay will encapsulate the original messages into one of the relay messages before it send it to the server or the client. In the forwarding mode, the virtual will just forward the message to either the server or the client. The default is relay.

#### idle-timeout

Specifies the number of seconds that a connection is idle before the connection is eligible for deletion. The default value is 60 seconds.

#### transaction-timeout

Specifies DHCPv6 transaction timeout, in seconds. The transactions should complete within the timeout specified. If a transaction does not complete for any reason, it is removed. The default value is 45 seconds.

#### authentication

Manages the subscriber authentication attributes.

#### enabled

To enable or disable subscriber authentication. If enabled, then user has to fill the following fields. Default is false.

#### virtual

Specifies the authentication virtual server name.

#### user-name

Manages the authentication user name's attributes. The user-name is what will be used to authenticate the DHCP client.

#### format

Specifies the user-name format. The options are: MAC address, option37, MAC + option37, option38, MAC + option38, option37 + option38, mac + option37 + option38 tcl-snippet. The concatenation symbols are defined as separator1 and separator2.

#### separator1

A string that is used to concatenate the MAC address and the first two strings of the authentication user-name. The default is @.

#### separator2

A string that is used to concatenate the MAC address and the second two strings of the authentication user-name. The default is @.

#### tcl-snippet

A tcl snippet to format the user name. This value will be taken into account only if the format value was chosen to be tcl-snippet.

#### subscriber-discovery

Manages the subscriber discovery attributes.

#### enabled

To enable or disable subscriber discovery. If enabled, then user has to fill the following fields. Default is false.

#### subscriber-id

Manages the subscriber-id attributes. The subscriber-id is used by SPM to create, delete and update subscriber sessions.

#### format

Specifies the user-name format. The options are: MAC address, option37, MAC + option37, option38, MAC + option38, option37 + option38, mac + option37 + option38 tcl-snippet. The concatenation symbols are defined as separator1 and separator2.

#### separator1

A string that is used to concatenate the first two strings of the subscriber-id. The default is @.

#### separator2

A string that is used to concatenate the second two strings of the subscriber-id. The default is @.

#### tcl-snippet

A tcl snippet to format the subscriber-id. This value will be taken into account only if the format value was chosen to be tcl-snippet.

remote-id-option  
Manages the DHCPv6 relay agent remote-id option (option 37) attributes. As a relay, the DHCP virtual can insert or remove this option.

add Specifies if the user wants the DHCP relay agent to insert option 37 or not. Default is false.

remove  
Specifies if the user wants the DHCP relay agent to remove option 37 from the server-to-client traffic or not. Default is false.

enterprise-number  
Specifies the enterprise number of the inserted remote-id option (option 37).

value  
A string to represent the remote-id option value.

subscriber-id-option  
Manages the DHCPv6 relay agent subscriber-id option (option 38) attributes. As a relay, the DHCP virtual can insert or remove this option.

add Specifies if the user wants the DHCP relay agent to insert option 38 or not. Default is false.

remove  
Specifies if the user wants the DHCP relay agent to remove option 38 from the server-to-client traffic or not. Default is false.

value  
A string to represent the subscriber-id option value.

## ltm profile diameter

NAME  
diameter - Configures a profile to manage Diameter network traffic.

MODULE  
ltm profile

SYNTAX  
Configure the diameter component within the ltm profile module using the syntax in the following sections.

#### CREATE/MODIFY

create diameter [name]

modify diameter [name]

#### options:

app-service [[string] | none]  
connection-prime [disabled | enabled]  
defaults-from [name]  
description [string]  
destination-realm [string]  
handshake-timeout [number]  
host-ip-rewrite [disabled | enabled]  
max-retransmit-attempts [number]  
max-watchdog-failure [number]  
origin-host-to-client [string]  
origin-host-to-server [string]  
origin-realm-to-client [string]  
origin-realm-to-server [string]  
overwrite-destination-host [disabled | enabled]  
parent-avp [ [number] | [string] ]  
persist-avp [ [number] | [string] ]  
reset-on-timeout [disabled | enabled]  
retransmit-timeout [number]  
watchdog-timeout [number]

mv diameter [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder options:

field-fmt  
global

DELETE

```
delete diameter [name]
```

#### DESCRIPTION

You can use the diameter component to configure a profile to manage Diameter network traffic.

#### EXAMPLES

```
create diameter my_diameter_profile defaults-from diameter
```

Creates a Diameter profile named `my_diameter_profile` that inherits its settings from the system default Diameter profile.

```
list diameter
```

Displays the properties of all Diameter profiles.

```
mv diameter /Common/my_diameter_profile to-folder /Common/my_folder
```

Moves a custom diameter profile named `my_diameter_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

connection-prime

When enabled, and the system receives a capabilities exchange request from the client, the system will establish connections and perform handshaking with all the servers prior to sending the capabilities exchange answer to the client. The default value is disabled.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is `diameter`.

description

User defined description.

destination-realm

This attribute has been deprecated as of BIG-IP v11.3.0. Specifies the realm to which messages are routed. A value of none indicates that the `destination-realm` option is disabled. The default value is none.

You can specify a fully qualified domain name as an ASCII string. For more information about this option, see RFC 3588 section 6.6.

`glob` Displays the items that match the `glob` expression. See `help glob` for a description of `glob` expression syntax.

handshake-timeout

Specifies the handshake timeout in seconds. This setting specifies the maximum number of seconds that a connection can be idle after the capabilities exchange request was sent to the server. The default value is 10. The system will reset the connection after it has timed out.

You can specify a numeric value in the range 0 to 4294967295. The recommended value is in the range of 5 to 30

host-ip-rewrite

When enabled and the message is a capabilities exchange request or capabilities exchange answer, rewrite the `host-ip-address` attribute with the system's egress IP address. The default value is enabled.

max-retransmit-attempts

Specifies the maximum number of retransmit attempts. This setting

specifies the maximum number of attempts that BIG-IP will take to retransmit the request messages if it does not receive the corresponding answer messages. If retransmit is unsuccessful, after maximum attempts, BIG\_IP will send an error response. The default value is 1.

You can specify a numeric value in the range 0 to 4294967295. The recommended value is in the range of 1 to 10

#### max-watchdog-failure

Specifies the maximum number of device watchdog failures that the traffic management system can take before it tears down the connection. After the system receives this number of device watchdog failures, it closes the connection. The default value is 10.

You can specify a numeric value in the range 0 to 4294967295.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### origin-host

This attribute has been deprecated as of BIG-IP v11.3.0. Please use, origin-host-to-client or origin-host-to-server. Specifies the origin host of BIG-IP. The origin-host is used to overwrite the server's actual origin host attribute when it responds to the client. A value of none indicates that origin-host is disabled. The default value is none.

You can specify an ASCII string as a FQDN. See RFC 3588 section 6.3.

#### origin-host-to-client

Specifies the origin host to client of BIG-IP. The origin-host-to-client is used to overwrite the server's actual origin host attribute when it responds to the client. A value of none indicates that origin-host-to-client is disabled. The default value is none.

You can specify an ASCII string as a FQDN. See RFC 3588 section 6.3.

#### origin-host-to-server

Specifies the origin host to server of BIG-IP. The origin-host-to-server is used to overwrite the client's actual origin host attribute when it responds to the server. A value of none indicates that origin-host-to-server is disabled. The default value is none.

You can specify an ASCII string as a FQDN. See RFC 3588 section 6.3.

#### origin-realm

This attribute has been deprecated as of BIG-IP v11.3.0. Please use, origin-realm-to-client or origin-realm-to-server. Specifies the origin realm of BIG-IP. The origin-realm is used to overwrite the server's actual origin realm attribute when it responds to the client. A value of none indicates that origin-realm is disabled. The default value is none.

You can specify an ASCII string as a FQDN. See RFC 3588 section 6.4.

#### origin-realm-to-client

Specifies the origin realm of BIG-IP. The origin-realm-to-client is used to overwrite the server's actual origin realm attribute when it responds to the client. A value of none indicates that origin-realm-to-client is disabled. The default value is none.

You can specify an ASCII string as a FQDN. See RFC 3588 section 6.4.

#### origin-realm-to-server

Specifies the origin realm to server of BIG-IP. The origin-realm-to-server is used to overwrite the client's actual origin realm attribute when it responds to the server. A value of none indicates that origin-realm-to-server is disabled. The default value is none.

You can specify an ASCII string as a FQDN. See RFC 3588 section 6.4.

#### overwrite-destination-host

This attribute has been deprecated as of BIG-IP v11.3.0. When you enable this option, the system replaces the value of the destination host field in the Diameter header with the BIG-IP(r) pool member address. When you disable this option, the system does not modify the destination host field. The default value is enabled.

#### parent-avp

Specifies the name of the Diameter attribute that the system uses to indicate if the persist-avp option is embedded in a grouped avp. A value of none indicates that the value of the persist-avp option is not embedded in a grouped avp. The default value is none.

You can specify an ASCII string or a numeric ID in the range 1 to 4294967295. Acceptable strings can be found in RFC 3588 section 4.5.

#### partition

Displays the administrative partition within which the profile resides.

**persist-avp**  
Specifies the name of the Diameter attribute that the system persists on. A value of none indicates that persistence is disabled. The default value is session-id.

You can specify an ASCII string or a numeric ID in the range 1 to 4294967295. Acceptable strings can be found in RFC 3588 section 4.5.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**reset-on-timeout**  
When it is enabled and the watchdog failures exceed the max watchdog failure, the system resets the connection. The default value is enabled.

**retransmit-timeout**  
Specifies the retransmit timeout in seconds. This setting specifies the number of seconds to retransmit the request messages if BIG-IP does not receive the corresponding answer messages. The default value is 10.

You can specify a numeric value in the range 0 to 4294967295. The recommended value is in the range of 5 to 30

**to-folder**  
diameter profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**watchdog-timeout**  
Specifies the watchdog timeout in seconds. This setting specifies the number of seconds that a connection is idle before the device watchdog request is sent. The default value is 0, which means BIG-IP will not send a device watchdog request to either client or server side.

You can specify a numeric value in the range 0 to 4294967295. The recommended value is in the range of 6 to 30

## ltm profile dns-logging

**NAME**  
dns-logging - Configures a domain name service logging (DNS Logging) profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the dns-logging component within the ltm profile module using the syntax in the following sections.

```
CREATE/MODIFY
create dns-logging [name]
modify dns-logging [name]
options:
  description [string]
  enable-query-logging [no | yes]
  enable-response-logging [no | yes]
  include-complete-answer [no | yes]
  include-query-id [no | yes]
  include-source [no | yes]
  include-timestamp [no | yes]
  include-view [no | yes]
  log-publisher [name]

edit dns-logging [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
```

## non-default-properties

```
mv dns-logging [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [fol
options:
to-folder
```

## DISPLAY

```
list dns-logging
list dns-logging [ [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties
one-line
partition
```

## DELETE

```
delete dns-logging [name]
```

## DESCRIPTION

You can use this component to create, modify, display, or delete a DNS logging profile, to enable query or response logging, and to define the format of messages themselves.

## EXAMPLES

```
list dns-logging
```

Displays the properties of all DNS logging profiles.

```
create dns-logging my_dns_log_profile enable-query-logging yes log-
publisher my_pub include-query-id yes
```

Creates a DNS logging profile with query logging enabled. Messages will be sent to publisher my\_pub. Messages will contain the query ID.

```
mv dns-logging /Common/my_dns_logging_profile to-folder
/Common/my_folder
```

Moves a custom dns-logging profile named my\_dns\_logging\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

## OPTIONS

**description**  
User defined description.

**enable-query-logging**  
Log the contents of DNS queries. The default value for this option is yes.

**enable-response-logging**  
Log the contents of DNS responses. The default value is no.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**include-complete-answer**  
Selects whether all the resource records are included in response log messages. The default value is yes (complete-answer).

**include-query-id**  
Selects whether the query id sent by the client is included in the query and response log messages. The default value is no.

**include-source**  
Selects whether the message originator is included in the query and response log messages. The default value is yes.

**include-timestamp**  
Selects whether the time stamp of the message is included in the query and response log messages. The default value is yes. You may or may not need this depending on whether the destination log servers prepend a time stamp to messages.

**include-view**  
Selects whether the view is included in the query log messages. The default value is yes.

**log-publisher**  
Specifies the log publisher used to deliver messages to one or more destinations. This option must be specified.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**to-folder**  
dns-logging profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

## ltm profile dns

**NAME**  
dns - Configures a Domain Name System (DNS) profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the dns component within the ltm profile module using the syntax in the following sections.

**CREATE/MODIFY**  
create dns [name]  
modify dns [name]  
options:  
app-service [[string] | none]  
avr-dnsstat\_sample\_rate [integer]  
cache [string]  
defaults-from [ [name] | none]  
description [string]  
dns64 [disabled | secondary | immediate | v4-only]  
dns64-additional-section-rewrite [disabled | v6-only | v4-only | any]  
dns64-prefix [IPv6 prefix]  
dns-security [string]  
enable-cache [no | yes]  
enable-dnssec [no | yes]  
enable-dns-express [no | yes]  
enable-dns-firewall [no | yes]  
enable-gtm [no | yes]  
enable-hardware-query-validation [no | yes]  
enable-hardware-response-cache [no | yes]  
enable-logging [no | yes]  
enable-rapid-response [no | yes]  
log-profile [ [name] | none]  
process-rd [no | yes]  
process-xfr [no | yes]  
rapid-response-last-action [allow | drop | noerror | nxdomain | refuse | truncate]  
unhandled-query-action [allow | drop | hint | noerror | reject]  
use-local-bind [no | yes]

edit dns [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

mv dns [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]  
options:  
to-folder

reset-stats dns  
reset-stats dns [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
list dns  
list dns [ [ [name] | [glob] | [regex] ] ... ]  
show running-config dns  
show running-config dns [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

**DELETE**  
delete dns [name]

**DESCRIPTION**  
You can use this component to create, modify, display, or delete a DNS profile to define how the BIG-IP system handles DNS traffic. You can also display and reset DNS profile statistics.

**EXAMPLES**  
create dns my\_dns\_profile defaults-from dns  
  
Creates a DNS profile named my\_dns\_profile that inherits its settings from the system default DNS profile.  
  
list dns  
  
Displays the properties of all DNS profiles.  
  
mv dns /Common/my\_dns\_profile to-folder /Common/my\_folder  
  
Moves a custom dns profile named my\_dns\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

## OPTIONS

### app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

### avr-dnsstat-sample-rate

Sets AVR DNS statistics rate. The default value is 0, which means AVR DNS statistics is disabled. If the sampling rate is set to 1, each query will be sent to the analytics database. If the sampling rate is set to an integer N, every Nth query will be sent and the analytics database will count it N times. When sampling rate is greater than one, the statistics will be inaccurate if the traffic volume is low. However, when the traffic volume is high, the system performance will benefit from sampling and the inaccuracy will be negligible. Also be aware that analytics database has its own internal sampling mechanism. The sampling rate does not apply to DNS firewall statistics. AVR DNS statistics contain query name, query type, virtual server IP and client IP.

### cache

Specifies the user-created cache that the system uses to cache DNS responses. When you select a cache for the system to use, you must also enable the DNS cache setting.

### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is dns.

### description

User defined description.

### dns64

Sets DNS64 mapping mode. The default value is disabled.

### dns64-additional-section-rewrite

Sets DNS64 additional section rewriting. For AAAA and A records in additional section, this field specifies how they are being rewritten. The default value is disabled.

### dns64-prefix

Specifies DNS64 mapping IPv6 prefix.

### dns-security

Indicates the DNS security profile the system uses.

### enable-cache

Indicates whether the system caches DNS responses. The default value is no.

### enable-dnssec

Indicates whether to perform DNS Security Extension (DNSSEC) operations on the DNS packet, for example, respond to DNSKEY queries; add RRSIGs to response.

### enable-dns-express

Indicates whether the dns-express service is enabled. The service handles zone transfers from the primary DNS server.

### enable-dns-firewall

Indicates whether DNS firewall capability is enabled. The default value is no.

### enable-gtm

Indicates whether the Global Traffic Manager handles DNS resolution for DNS queries and responses that contain Wide IP names. The default value is yes.

### enable-hardware-query-validation

On supported platforms, indicates whether the hardware will accelerate query validation. The default value is no.

### enable-hardware-response-cache

On supported platforms, indicates whether the hardware will cache responses. The default value is no.

### enable-logging

Indicates whether to enable high speed logging for DNS queries and responses or not. Default value is no. When it is set to yes, a DNS profile must be configured with a log-profile.

### enable-rapid-response

On supported platforms, indicates whether to allow queries to be answered by Rapid Response. The default value is no. When enabled, if the query name matches a GTM Wide IP name and GTM is enabled on this profile, the DNS query will bypass Rapid Response.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

### log-profile

Specifies the DNS logging profile used to configure what events get logged and their message format.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

### partition

Displays the administrative partition within which the profile resides.

**process-rd**  
Indicates whether to process client-side DNS packets with Recursion Desired set in the header. The default value is yes. If set to no, processing of the packet will be subject to the unhandled-query-action option.

**process-xfr**  
Indicates whether the system answers zone transfer requests for a DNS zone created on the system. The default value is no. The enable-dns-express and process-xfr settings affect how the system responds to zone transfer requests.

**rapid-response-last-action**  
Specifies what action to take when Rapid Response is enabled and the incoming query has not matched a DNS-Express Zone. Default is drop. Option allow sends non-matching queries up the regular packet processing path. All other options result in a response returned immediately to the client: truncate (truncate), nxdomain (non-existent name), noerror (no data), refuse (REFUSED return code).

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**to-folder**  
dns profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**unhandled-query-action**  
Specifies the action to take when a query does not match a Wide IP or a DNS Express Zone. The default value is allow.

**use-local-bind**  
Indicates whether non-GTM and non-dns-express requests should be forwarded to the local BIND.

DELETE
delete fasthttp [name]

DESCRIPTION
You can use this component to create, modify, display, or delete a Fast
HTTP profile. This profile provides the ability to accelerate certain
HTTP connections such as banner ads.

EXAMPLES
create fasthttp my_fast_http_profile defaults-from fasthttp

Creates a Fast HTTP profile named my_fast_http_profile that inherits
its settings from the system default Fast HTTP profile.

mv fasthttp /Common/my_fasthttp_profile to-folder /Common/my_folder

Moves a custom fasthttp profile named my_fasthttp_profile to a folder
named my_folder, where my_folder has already been created and exists
within /Common.

show fasthttp

Displays fasthttp profile statistics in the system default units.

OPTIONS
app-service
Specifies the name of the application service to which the profile
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the profile. Only the application
service can modify or delete the profile.

client-close-timeout
Specifies the number of seconds after which the system closes a
client connection, when the system either receives a client FIN
packet or sends a FIN packet. This option overrides the idle-
timeout option. The default value is 5.

server-sack
Specifies whether to support server sack option in cookie response
by default. The default value is disabled.

server-timestamp
Specifies whether to support server timestamp option in cookie
response by default. The default value is disabled.

receive-window-size
Specifies the window size to use, minimum and default to 65535
bytes, the maximum is 2^31 for window scale enabling.

connpool-idle-timeout-override
Specifies the number of seconds after which a server-side
connection in a OneConnect(tm) pool is eligible for deletion, when
the connection has no traffic. This option overrides the idle-
timeout option. The default value is 0 (zero) seconds, which
disables the override setting.

connpool-max-reuse
Specifies the maximum number of times that the system can re-use a
current connection. The default value is 0 (zero).

connpool-max-size
Specifies the maximum number of connections to a load balancing
pool. A value of 0 (zero) specifies that a pool can accept an
unlimited number of connections. The default value is 2048.

```

#### connpool-min-size

Specifies the minimum number of connections to a load balancing pool. The default value of 0 (zero) specifies that there is no minimum.

#### connpool-replenish

When enabled, the system replenishes the number of connections to a load balancing pool to the number of connections that existed when the server closed the connection to the pool. The default value is enabled.

When disabled, the system replenishes the connection that was closed by the server, only when there are fewer connections to the pool than the number of connections set in the connpool-min-size option.

#### connpool-step

Specifies the increment at which the system makes additional connections available, when all available connections are in use. The default value is 4.

#### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is fasthttp.

#### description

User defined description.

#### force-http10-response

Specifies whether to rewrite the HTTP version in the status line of the server to HTTP 1.0 to discourage the client from pipelining or chunking data. The default value is disabled.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### hardware-syn-cookie

This option is deprecated in version 13.0.0 because it is not a fully functioning feature. Specifies whether or not to use hardware SYN Cookie when cross system limit. The default value is enabled

#### header-insert

Specifies a string that the system inserts as a header in an HTTP request. If the header exists already, the system does not replace it. The default value is none.

#### http11-close-workarounds

Enables or disables HTTP 1.1 close workarounds. The default value is disabled.

#### idle-timeout

Specifies the number of seconds after which a connection is eligible for deletion, when the connection has no traffic. The default value is 300 seconds.

#### insert-xforwarded-for

Specifies whether the system inserts the XForwarded For header in an HTTP request with the client IP address, to use with connection pooling.

The options are:

#### disabled

Specifies that the system does not insert the XForwarded For header.

#### enabled

Specifies that the system inserts the XForwarded For header with the client IP address.

#### layer7

When enabled, the system parses HTTP data in the stream. Disable this option if you want to use the performance HTTP profile to shield against denial-of-service attacks against non-HTTP protocols. The default value is enabled.

#### max-header-size

Specifies the maximum amount of HTTP header data that the system buffers before making a load balancing decision. The default value is 32768.

#### max-requests

Specifies the maximum number of requests that the system can receive on a client connection, before the system closes the connection. The default value of 0 specifies that requests are not limited.

#### mss-override

Specifies a maximum segment size (MSS) override for server connections. The default value is 0 (zero), which corresponds to an MSS of 1460. You can specify any integer between 536 and 1460.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### partition

Displays the administrative partition within which the component resides.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression])

to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**reset-on-timeout**

When enabled, the system sends a TCP RESET packet when a connection times out, and deletes the connection. The default value is enabled.

**server-close-timeout**

Specifies the number of seconds after which the system closes a client connection, when the system either receives a client FIN packet or sends a FIN packet. This option overrides the value of the idle-timeout option. The default value is 5.

**to-folder**

fasthttp profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**unclean-shutdown**

Specifies how the system handles closing a connection. The options are:

**disabled**

Prevents an unclean shutdown of a client connection. This is the default value.

**enabled**

Specifies to permit an unclean shutdown of a client connection.

**fast** Specifies that the system sends a RESET packet to close the connection only if the client attempts to send further data after the response has completed.

**SEE ALSO**

create, delete, edit, glob, list, ltm virtual, modify, mv, regex, reset-stats, show, tmsh

DELETE
delete fastL4 [name]

```

#### DESCRIPTION

You can use this component to create, modify, display, or delete a Fast Layer 4 profile. The Fast L4 profile is the default profile that the system uses when you create a basic configuration for non-UDP (User Datagram Protocol) traffic.

Any changes you make to an active Fast L4 profile (one that is in use by a virtual server) take effect after the value of the idle-timeout option has passed. That means new connections are affected by the profile change immediately. However, for the new values to take effect, old connections need to be either aged out or closed. =head1 EXAMPLES

```
create fastl4 my_fastl4_profile defaults-from fastl4
```

Creates a custom Fast Layer 4 profile named `my_fastl4_profile` that inherits its settings from the system default Fast L4 profile.

```
mv fastl4 /Common/my_fastl4_profile to-folder /Common/my_folder
```

Moves a custom fastl4 profile named `my_fastl4_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

Please refer to the mv manual page for examples on how to use the mv command.

```
show fastl4
```

Displays statistics for all Fast Layer 4 profiles.

#### OPTIONS

`app-service`

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

`defaults-from`

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is fastl4.

`description`

User defined description.

`glob` Displays the items that match the glob expression. See help glob

for a description of glob expression syntax.

#### hardware-syn-cookie

This option is deprecated in version 13.0.0 and is replaced by `syn-cookie-enable`. Enables or disables hardware SYN cookie support when PVA10 is present on the system. The default value is disabled.

Note that when you set the `hardware-syn-cookie` option to enabled, you may also want to set the following `bigdb` database variables using the `db` component, based on your requirements:

```
pva.SynCookies.Full.ConnectionThreshold (default: 500000)
pva.SynCookies.Assist.ConnectionThreshold (default: 500000)
pva.SynCookies.ClientWindow (default: 0)
  idle-timeout
```

Specifies the number of seconds that a connection is idle before the connection is eligible for deletion. The default value is 300 seconds. You can also specify `immediate` or `indefinite`.

When you specify an `idle-timeout` for the Fast L4 profile, for the profile to work properly, the value needs to be greater than the `bigdb` database variable `Pva.Scrub_time_in_msec`.

#### ip-tos-to-client

Specifies an IP Type of Service (ToS) number for the client-side. This option specifies the ToS level that the traffic management system assigns to IP packets when sending them to clients. The default value is 65535, which indicates, do not modify.

#### ip-tos-to-server

Specifies an IP ToS number for the server side. This option specifies the ToS level that the traffic management system assigns to IP packets when sending them to servers. The default value is 65535, which indicates, do not modify.

#### keep-alive-interval

Specifies the keep-alive probe interval, in seconds. The default value is disabled (0 seconds).

#### ip-df-mode

Describe the Don't Fragment (DF) bit setting in the IP Header of the outgoing TCP packet. The available settings are: `Pmtu`: Set the outgoing IP Header DF bit based on IP `pmtu` setting (`tm.pathttudiscovery`). `Preserve`: Set the outgoing Packet's IP Header DF bit to be same as incoming IP Header DF bit. `Set`: Set the outgoing packet's IP Header DF bit. `Clear`: Clear the outgoing packet's IP Header DF bit. The default setting is `Preserve`.

#### ip-ttl-mode

Describe the outgoing TCP packet's IP Header TTL mode. The available Modes are: `Proxy`: Set the outgoing IP Header TTL value to 255/64 for `ipv4/ipv6` respectively. `Preserve`: Set the outgoing IP Header TTL value to be same as the incoming IP Header TTL value. `Decrement`: Set the outgoing IP Header TTL value to be one less than the incoming TTL value. `Set`: Set the outgoing IP Header TTL value to a specific value (as specified by `ip-ttl-v[4|6]`). The default mode is `Proxy`.

#### ip-ttl-v4

Specify the outgoing packet's IP Header TTL value for IPv4 traffic. Maximum TTL value that can be specified is 255. The default is 255.

#### ip-ttl-v6

Specify the outgoing packet's IP Header TTL value for IPv6 traffic. Maximum TTL value that can be specified is 255. The default is 64.

#### link-qos-to-client

Specifies a Link Quality of Service (QoS) (VLAN priority) number for the client side. This option specifies the QoS level that the system assigns to packets when sending them to clients. The default value is 65535, which indicates, do not modify.

#### link-qos-to-server

Specifies a Link QoS (VLAN priority) number for the server side. This option specifies the QoS level that the system assigns to packets when sending them to servers. The default value is 65535, which indicates, do not modify.

#### priority-to-client

Specifies internal packet priority for the client side. This option specifies the internal packet priority that the system assigns to packets when sending them to clients. The default value is 65535, which indicates, do not modify.

#### priority-to-server

Specifies internal packet priority for the server side. This option specifies the internal packet priority that the system assigns to packets when sending them to servers. The default value is 65535, which indicates, do not modify.

#### loose-close

Specifies that the system closes a loosely-initiated connection when the system receives the first FIN packet from either the client or the server. The default value is disabled.

#### loose-initialization

Specifies that the system initializes a connection when it receives any Transmission Control Protocol (TCP) packet, rather than requiring a SYN packet for connection initiation. The default value is disabled.

#### mss-override

Specifies a maximum segment size (MSS) override for server connections. Note that this is also the MSS advertised to a client when a client first connects.

The default value is 0 (zero), which disables this option. You can specify an integer from 256 to 9162.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### partition

Displays the administrative partition within which the component resides.

#### pva-acceleration

Specifies the Packet Velocity(r) ASIC acceleration policy. The default value is full. In 12.1, dedicated mode is the new low latency policy which replaces guaranteed. The full and partial mode has same effect for ePVA platforms.

#### pva-dynamic-client-packets

Specifies the number of client packets before dynamic ePVA hardware re-offloading occurs. The valid value is 0-10. The default value is 2.

#### pva-dynamic-server-packets

Specifies the number of server packets before dynamic ePVA hardware re-offloading occurs. The valid value is 0-10. The default value is 2.

#### pva-offload-dynamic

Specifies whether PVA flow dynamic offloading is enabled or not. The default is enabled.

For a flow or flow(s) in a connection to be offloaded to ePVA hardware, both the client (pva-dynamic-client-packets) and server (pva-dynamic-server-packets) flow packets setting need to be satisfied. If only one direction packets need to be taken into consideration, the other direction packets should set to zero.

#### pva-offload-state

Specifies at what stage the ePVA performs hardware offload. The default value is embryonic and implies at TCP CSYN or the first client UDP packet. establish implies TCP 3WAY handshaking or UDP CS round trip are confirmed.

#### pva-flow-aging

Specifies if automatic aging from ePVA flow cache upon inactive and idle for a period, default to enabled.

#### pva-flow-evict

Specifies if this flow can be evicted upon hash collision with a new flow learn snoop request, defaults to enabled.

#### reassemble-fragments

Specifies whether to reassemble fragments. The default value is disabled.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### reset-on-timeout

Specifies whether you want to reset connections on timeout. The default value is enabled.

#### rtt-from-client

Enables or disables the TCP timestamp options to measure the round trip time to the client. The default value is disabled.

#### rtt-from-server

Enables or disables the TCP timestamp options to measure the round trip time to the server. The default value is disabled.

#### server-sack

Specifies whether to support server sack option in cookie response by default. The default value is disabled.

#### server-timestamp

Specifies whether to support server timestamp option in cookie response by default. The default value is disabled.

#### receive-window-size

Specifies the window size to use, minimum and default to 65535 bytes, the maximum is 2<sup>31</sup> for window scale enabling.

#### software-syn-cookie

This option is deprecated in version 13.0.0 and is replaced by syn-cookie-enable. Enables or disables software SYN cookie support when PVA10 is not present on the system. The default value is disabled.

#### syn-cookie-enable

Enables syn-cookies capability on this virtual server. For the details on the threshold at which syn-cookies are triggered please see default-vs-syn-challenge-threshold and global-syn-challenge-threshold or the tcp-half-open vector in the DoS profile. The default is enabled.

#### syn-cookie-whitelist

Specifies whether or not to use a SYN Cookie WhiteList when doing software SYN Cookies. This means not doing a SYN Cookie for the same src IP address if it has been done already in the previous tm.flowstate.timeout (30) seconds. The default value is disabled.

tcp-close-timeout

Specifies a TCP close timeout in seconds. You can also specify immediate or indefinite. The default value is 5 seconds.

tcp-generate-isn

Specifies whether you want to generate TCP sequence numbers on all SYNs that conform with RFC1948, and allow timestamp recycling. The default value is disabled.

tcp-handshake-timeout

Specifies a TCP handshake timeout in seconds. You can also specify immediate or indefinite. The default value is 5 seconds.

tcp-time-wait-timeout

Specifies a TCP time\_wait timeout in milliseconds. The default value is 0 milliseconds.

tcp-strip-sack

Specifies whether you want to block the TCP SackOK option from passing to the server on an initiating SYN. The default value is disabled.

tcp-timestamp-mode

Specifies how you want to handle the TCP timestamp. The default value is preserve.

tcp-wscale-mode

Specifies how you want to handle the TCP window scale. The default value is preserve.

late-binding

Specifies whether to enable or disable intelligent selection of a back-end server pool. The default value is disabled. With this option enabled, an iRule can read a Layer 7 (FIX) packet to select a server pool, and then can send the FIX stream down to the ePVA. The ePVA then manages the FIX stream at a low latency, for as long as the stream persists. To keep the latency low, the BIG-IP software does not examine any more Layer-7 data in that FIX stream.

If you enable this option, you also need a FIX profile in the Performance FastL4 Virtual Server configuration.

explicit-flow-migration

Specifies whether to have the iRule code determine exactly when the FIX stream drops down to the ePVA hardware. The default value is disabled.

The explicit flow migration state indicates whether connections are automatically migrated into the ePVA hardware (disabled), or the iRule must explicitly migrate them with the BIGTCP::release\_flow command (enabled).

client-timeout

Specifies late binding client timeout in seconds. This is the number of seconds allowed for a client to transmit enough data to select a server pool. If this timeout expires, the timeout-recovery option dictates whether to drop the connection or fallback to the normal FastL4 load-balancing method to pick a server pool. The default timeout is 30 seconds.

timeout-recovery

Specifies late binding timeout recovery mode. This is the action to take when late binding timeout occurs on a connection. This could be disconnect if only the L7 iRule actions are acceptable to pick a server or fallback if the normal FastL4 load-balancing methods are acceptable to pick a server. The default action is to disconnect.

to-folder

fastl4 profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

## ltm profile fix

**NAME**  
fix - Configures an Financial Information eXchange Protocol (FIX) profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the fix component within the ltm profile module using the syntax shown in the following sections.

### CREATE/MODIFY

```
create fix [name]
modify fix [name]
options:
  app-service [(string) | none]
  defaults-from { [name] | none}
  description [string]
  error-action [drop_connection | dont_forward]
  full-logon-parsing [true | false]
  message-log-publisher [publisher]
  quick-parsing [true | false]
  statistics-sample-interval [integer]
  report-log-publisher [publisher]
  response-parsing [true | false]
  sender-tag-class {{[sender-id] [class name]}...}
```

```
edit fix [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
reset-stats fix
reset-stats fix [ [name] | [glob] | [regex] ] ... ]
```

### DISPLAY

```
list fix
list fix [ [name] | [glob] | [regex] ] ... ]
show running-config fix
show running-config fix [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
show fix
show fix [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
```

### DELETE

```
delete fix [name]
```

### DESCRIPTION

You can use the fix component to manage an Financial Information eXchange Protocol profile.

### EXAMPLES

```
create fix my_fix defaults-from fix
```

Creates an financial information exchange protocol profile named `my_fix` using the system defaults.

```
create fix my_fix { }
```

Creates an financial information exchange protocol profile named `my_fix`.

#### app-service

Specifies the name of the application service to which this object belongs. The default value is none.

**Note:** If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete this object. Only the application service can modify or delete this object.

#### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all of the settings and values from the specified parent profile. The default value is none.

#### description

User defined description.

#### error-action

Specifies the error handling method.

#### full-logon-parsing

Enable or disable logon message is always fully parsed.

#### message-log-publisher

Specifies the publisher for message logging.

#### quick-parsing

Enable or disable quick parsing which parses the basic standard fields and validates message length and checksum.

statistics-sample-interval  
Specifies the sample interval in seconds of the message rate.

response-parsing  
Enable or disable response parsing which parses the messages from  
FIX server.

report-log-publisher  
Specifies the publisher for error message and status report.

partition  
Specifies the administrative partition within which the profile  
resides.

sender-tag-class  
Specifies the tag substitution map between sender id and tag  
substitution data group.

SEE ALSO

## ltm profile ftp

NAME  
ftp - Configures an FTP profile.

MODULE  
ltm profile

SYNTAX  
Configure the ftp component within the ltm profile module using the  
syntax shown in the following sections.

CREATE/MODIFY

```
create ftp [name]
modify ftp [name]
options:
  app-service [[string] | none]
  defaults-from [ [name] | none]
  description [string]
  port [name]
  allow-ftps [disabled | enabled]
  security [disabled | enabled]
  translate-extended [disabled | enabled]
  inherit-parent-profile [disabled | enabled]
  log-publisher [log publisher name | none]
  log-profile [log profile name | none]
```

```
mv ftp [ [source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]
options:
  to-folder
```

```
edit ftp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list ftp
list ftp [ [name] | [glob] | [regex] ] ... ]
show running-config ftp
show running-config ftp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

DELETE

```
delete ftp [name]
```

DESCRIPTION

Use this command to create, modify, display, or delete an FTP profile  
with which you can manage FTP traffic.

EXAMPLES

```
create ftp my_ftp_profile defaults-from ftp
```

Creates a custom FTP profile named `my_ftp_profile` that inherits its settings from the system default FTP profile.

`list ftp`

Displays the properties of all FTP profiles.

`mv ftp /Common/my_ftp_profile to-folder /Common/my_folder`

Moves a custom ftp profile named `my_ftp_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

#### OPTIONS

`app-service`

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

`defaults-from`

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is `ftp`.

`description`

User defined description.

`glob` Displays the items that match the `glob` expression. See `help glob` for a description of `glob` expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`port` Specifies a service for the data channel port used for this FTP profile. The default port is `ftp-data`.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

`allow-ftps`

Allow explicit FTPS negotiation. The default value is disabled.

`security`

Enables or disables secure FTP traffic for the BIG-IP(r) Application Security Manager. You can set the `security` option only if the system is licensed for the BIG-IP Application Security Manager. The default value is disabled.

`to-folder`

ftp profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

`translate-extended`

This option is enabled by default, and thus, automatically translates RFC2428 extended requests `EPSV` and `EPRT` to `PASV` and `PORT` when communicating with IPv4 servers.

`inherit-parent-profile`

Enables the FTP data channel to inherit the TCP profile used by the control channel. If disabled, the data channel uses `FastL4` (`BigProto`) only.

`log-publisher`

Specify the name of the log publisher which logs translation events. See `help sys log-config` for more details on the logging sub-system. Use the `"sys log-config publisher"` component to set up a log publisher.

`log-profile`

Specify the name of the ALG log profile which controls the logging of ALG. See `help ltm alg-log-profile` for more details on the logging profile sub-system. Use the `"ltm alg-log-profile profile"` component to set up a ALG log profile.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm virtual`, `modify`, `mv`, `regex`, `reset-stats`, `show`, `tmsh`

#### COPYRIGHT

## ltm profile gtp

**NAME**  
gtp - Configures a GTP profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the gtp component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create gtp [name]  
modify gtp [name]  
options:  
  app-service [[string] | none]  
  defaults-from [ [name] | none]  
  description [string]  
  ingress-max [integer]

edit gtp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

mv gtp [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]  
options:  
  to-folder

reset-stats gtp  
reset-stats gtp [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
list gtp  
list gtp [ [ [name] | [glob] | [regex] ] ... ]  
show running-config gtp  
show running-config gtp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition

show gtp  
show gtp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
  field-fmt

**DELETE**  
delete gtp [name]

**DESCRIPTION**  
You can use the gtp component to manage a GTP profile.

**EXAMPLES**  
create gtp my\_gtp\_profile defaults-from gtp  
  
Creates a GTP profile named my\_gtp\_profile using the system defaults.  
  
create gtp my\_gtp\_profile { ingress-max 1000 }  
  
Creates a GTP profile named my\_gtp\_profile that specifies the maximum number of messages that can be held in the ingress queue is 1000.  
  
mv gtp /Common/my\_gtp\_profile to-folder /Common/my\_folder  
  
Moves a custom gtp profile named my\_gtp\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all of the settings and values from the specified parent profile. The default value is gtp.

description  
User defined description.

glob  
Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

ingress-max  
Specifies the maximum number of messages that can be held in ingress queue. If it is 0, then it is unlimited. The default value is 0.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition  
Displays the administrative partition within which the component resides.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

## ltm profile html

NAME  
html - Configures an HTML profile.

MODULE  
ltm profile

SYNTAX  
Configure the html component within the ltm profile module using the syntax shown in the following sections.

```
CREATE/MODIFY
create html [name]
modify html [name]
options:
  defaults-from [ [name] | none]
  content-detection [disabled | enabled]
  content-selection
    [add | delete | replace-all-with] {
[content-type] ...
    }
  content-selection none
  rules
    [add | delete | replace-all-with] {
[html-rule] ...
    }
  rules none

mv html [ [source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]]
options:
  to-folder

reset-stats html
reset-stats html [ [ [name] | [glob] | [regex] ] ... ]

DISPLAY
list html
list html [ [ [name] | [glob] | [regex] ] ... ]
show running-config html
show running-config html [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show html
show html [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global

DELETE
delete html [name]
```

DESCRIPTION  
Use this command to create, modify, display, or delete an HTML profile with which you can manage HTML traffic.

EXAMPLES

```
create html my_html_profile defaults-from html
```

Creates a custom HTML profile named `my_html_profile` that inherits its settings from the system default HTML profile.

```
list html
```

Displays the properties of all HTML profiles.

```
mv html /Common/my_html_profile to-folder /Common/my_folder
```

Moves a custom HTML profile named `my_html_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

Please refer to the `mv` manual page for examples on how to use the `mv` command.

#### OPTIONS

`defaults-from`

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is `html`.

`description`

User defined description.

`glob` Displays the items that match the `glob` expression. See `help glob` for a description of `glob` expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`content-detection`

Scans initial HTTP payload to look for HTML signatures and enables HTML profile if HTML-like patterns are detected.

`content-selection`

Matches content-type from response header against a list of content-types and enables HTML profile if a match is found.

`rules`

Specifies a list of HTML (content rewrite) rules, separated by spaces, that are used for parsing and patching HTML.

`to-folder`

HTML profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

#### SEE ALSO

`create`, `delete`, `glob`, `list`, `ltm virtual`, `modify`, `mv`, `reset-stats`, `show`, `tmsh`

#### COPYRIGHT

## ltm profile http-compression

#### NAME

`http-compression` - Configures an HTTP Compression profile.

#### MODULE

`ltm profile`

#### SYNTAX

Configure the `http-compression` component within the `ltm profile` module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create http-compression [name]
```

```
modify http-compression [name]
```

##### options:

```
allow-http-10 [disabled | enabled]
```

```
app-service [[string] | none]
```

```
browser-workarounds [disabled | enabled]
```

```
buffer-size [integer]
```

```
cpu-saver [disabled | enabled]
```

```

    cpu-saver-high [integer]
    cpu-saver-low [integer]
    content-type-exclude
      [add | delete | replace-all-with] {
[content type] ...
      }
    content-type-exclude none
    content-type-include
      [add | delete | replace-all-with] {
[content type] ...
      }
    content-type-include none
    defaults-from [ [name] | none]
    description [string]
    gzip-level [integer]
    gzip-memory-level [integer, in bytes]
    gzip-window-size [integer]
    keep-accept-encoding [disabled | enabled]
    method-prefer [deflate | gzip]
    min-size [integer]
    selective [disabled | enabled]
    uri-exclude
      [add | delete | replace-all-with] {

    one-line
    partition

show http-compression
show http-compression [ [ [name] | [glob] | [regex] ] ... ]
  options:
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    field-fmt
    global

DELETE
delete http-compression [name]

DESCRIPTION
  You can use the http-compression component to create, modify, display,
  or delete an HTTP Compression profile.

  The BIG-IP(r) system installation includes the following default HTTP
  Compression-type profiles:

  o http-compression

  o wan-optimized-compression

  The default HTTP Compression profile contains values for properties
  related to managing compression settings.

  You can create a new HTTP Compression-type profile using an existing
  profile as a parent profile, and then you can change the values of the
  properties to suit your needs.

EXAMPLES
  create http-compression my_hc_profile defaults-from http-compression

  Creates a custom HTTP Compression profile named my_hc_profile that
  inherits its settings from the system default HTTP Compression profile.

  mv http-compression /Common/my_httpcompression_profile to-folder
  /Common/my_folder

  Moves a custom http-compression profile named
  my_httpcompression_profile to a folder named my_folder, where my_folder
  has already been created and exists within /Common.

OPTIONS
  allow-http10
  Enables or disables compression of HTTP/1.0 server responses. The
  default value is disabled.

  app-service

```

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

#### browser-workarounds

Enables or disables compression of browser workarounds. The default value is disabled. Enabling this options turns off compression on server responses when any of the following conditions are detected:

- o If the client browser is Netscape Navigator(r) version 4.0x, compression is turned off. Netscape advertises that the browser can handle compression gracefully. In this case, F5 Networks disables compression entirely for that class of browser.

- o If the client browser is Netscape Navigator version 4.x (4.10 and later) and the server response Content-Type is not either text/html or text/plain compression is turned off. This class of Netscape browsers can handle plain text and HTML just fine, but there are known issues with other types of content.

- o If the client browser is Microsoft(r) Internet Explorer (any version), the server response Content-Type is either text/css or application/x-javascript, and the client connection is over SSL, compression is turned off. The Microsoft article ID for this problem is 825057.

- o If the client browser is Microsoft Internet Explorer (any version), the server response Content-Type is either text/css or application/x-javascript, and the server sets the header Cache-Control to no-cache, compression is turned off. The Microsoft article ID for this problem is 327286.

#### buffer-size

Specifies the maximum number of uncompressed bytes that the system buffers before determining whether to compress the response. Useful when the headers of a server response do not specify the length of the response content. The default value is 4096.

#### content-type-exclude

Specifies a string list of HTTP Content-Type responses that you do not want the system to compress. The default value is none.

#### content-type-include

Specifies a string list of HTTP Content-Type responses that you want the system to compress. The default value is { text/application/ (xml|x-javascript) }.

#### cpu-saver

Enables or disables the CPU saver feature. When the CPU saver is enabled, the system monitors the percent of CPU usage and adjusts compression rates automatically when the CPU usage reaches the percentage defined in the compress-cpu-saver-low and compress-cpu-saver-high options. The default value is enabled.

#### cpu-saver-high

Specifies the percent of CPU usage at which the system starts automatically decreasing the amount of content being compressed, as well as the amount of compression that the system is applying. The default value is 90.

#### cpu-saver-low

Specifies the percent of CPU usage at which the system resumes content compression at the user-defined rates. The default value is 75.

#### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is httpcompression.

#### description

User defined description.

#### gzip-level

Specifies a value that determines the amount of memory that the system uses when compressing a server response. The default value is 1.

#### gzip-memory-level

Specifies the amount of memory (in kilobytes) that the system uses when compressing a server response. The system rounds the value up to the nearest power of two. The default value is 8. The maximum value is 256.

#### gzip-window-size

Specifies the number of kilobytes in the window size that the system uses when compressing a server response. The system rounds the value up to the nearest power of two. The default value is 16k. The maximum value is 128k.

#### keep-accept-encoding

Specifies where data compression is performed. When enabled, the target server, rather than the BIG-IP local traffic management system, performs data compression. The default value is disabled.

#### method-prefer

Specifies the type of compression that the system prefers. The default value is gzip.

#### min-size

Specifies the minimum length in bytes of a server response that is acceptable for compression. The length in bytes applies to content length only, not headers. The default value is 1024.

**partition**

Displays the administrative partition within which the profile resides.

**selective**

Enables or disables selective compression mode. Note that the data compression feature compresses HTTP server responses, and not client requests. The default value is disabled.

**to-folder**

http-compression profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**uri-exclude**

Disables compression on a specified list of HTTP Request-URI responses. Use a regular expression to specify a list of URIs you do not want to compress. The default value is none.

**uri-include**

Enables compression on a specified list of HTTP Request-URI responses. Use a regular expression to specify a list of URIs you want to compress. The default value is { .\* }.

**vary-header**

Enables or disables the insertion of a Vary header into cacheable server responses. The default value is enabled.

DELETE
delete http [name]

```

#### DESCRIPTION

You can use the http component to create, modify, display, or delete an HTTP profile.

The BIG-IP(r) system installation includes the following default HTTP-type profiles:

http

The default HTTP profile contains values for properties related to managing HTTP traffic.

You can create a new HTTP-type profile using an existing profile as a parent profile, and then you can change the values of the properties to

suit your needs.

#### EXAMPLES

```
create http my_http_profile defaults-from http
```

Creates a custom HTTP profile named `my_http_profile` that inherits its settings from the system default HTTP profile.

```
mv http /Common/my_http_profile to-folder /Common/my_folder
```

Moves a custom HTTP profile named `my http profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

Please refer to the `mv` manual page for examples on how to use the `mv` command.

#### OPTIONS

`accept-xff`

Enables or disables trusting the client IP address, and statistics from the client IP address, based on the request's XFF (X-forwarded-for) headers, if they exist.

`app-service`

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

`basic-auth-realm`

Specifies a quoted string for the basic authentication realm. The system sends this string to a client whenever authorization fails. The default value is none.

`defaults-from`

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is `http`.

`description`

User defined description.

`encrypt-cookie-secret`

Specifies a passphrase for the cookie encryption. The default value is none.

`encrypt-cookies`

Specifies to encrypt specific cookies that the BIG-IP system sends to a client system. The default value is none.

`enforcement`

Specifies protocol enforcement options for the HTTP profile:

`excess-client-headers`

Specifies the pass-through behavior when `max-header-count` is exceeded by the client. The default is disabled which rejects the connection.

`excess-server-headers`

Specifies the pass-through behavior when `max-header-count` is exceeded by the server. The default is disabled which rejects the connection.

`unknown-method`

Specifies the behavior when an unknown method is seen. The default is allow which allows all methods, (known or unknown).

`known-methods`

Specifies the HTTP methods known by the HTTP filter. Combine with the `unknown-method` field to control behavior when unusual methods are parsed.

`max-header-size`

Specifies the maximum header size. The default value is 32768.

`max-header-count`

Specifies the maximum number of headers in HTTP request or response that will be handled. If client or server sends request or response with the number of headers greater than specified, the connection will be dropped. The default value is 64.

`max-requests`

Specifies the number of requests that the system accepts on a per-connection basis. The default value is 0 (zero), which means the system does not limit the number of requests per connection.

`oversize-client-headers`

Specifies the pass-through behavior when `max-header-size` is exceeded by the client. The default is disabled which rejects the connection.

`oversize-server-headers`

Specifies the pass-through behavior when `max-header-size` is exceeded by the server. The default is disabled which rejects the connection.

`pipeline`

Enables or disables HTTP/1.1 pipelining. If `pass-through` is chosen, then the HTTP filter will switch to pass through mode

(and be disabled) if pipelined data is seen. The default value is allow, which means that clients can make requests even when prior requests have not received a response. In order for this to succeed, however, destination servers must include support for pipelining.

#### to-folder

http profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

#### truncated-redirects

Specifies the pass-through behavior when a redirect lacking the trailing carriage-return and line feed pair at the end of the headers is parsed. The default is disabled, which will silently drop the invalid HTTP.

#### unknown-method

Specifies the behavior (allow, reject, or pass-through) when an unknown HTTP method is parsed. The default is to allow unknown methods.

#### fallback-host

Specifies an HTTP fallback host. The default value is none.

With HTTP redirection, you can redirect HTTP traffic to another protocol identifier, host name, port number, or URI path. For example, if all members of a targeted pool are unavailable (that is, the members are disabled, marked as down, or have exceeded their connection limit), the system can redirect the HTTP request to the fallback host, with the HTTP reply Status Code 302 Found.

#### fallback-status-codes

Specifies one or more three-digit status codes that can be returned by an HTTP server. The default value is none.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### header-erase

Specifies the header string that you want to erase from an HTTP request. The default value is none.

#### header-insert

Specifies a quoted header string that you want to insert into an HTTP request. The default value is none.

The HTTP header being inserted can include a client IP address. Including a client IP address in an HTTP header is useful when a connection goes through a secure network address translation (SNAT) and you need to preserve the original client IP address. When you assign the configured HTTP profile to a virtual server, the system then inserts the header specified by the profile into any HTTP request that the system sends to a pool or pool member.

#### insert-xforwarded-for

Enables or disables insertion of an X-Forwarded-For header. The default value is disabled.

When using connection pooling, which allows clients to make use of other client requests' server connections, you can insert the X-Forwarded-For header and specify a client IP address.

#### lws-separator

Specifies the linear white space separator that the system uses between HTTP headers when a header exceeds the maximum width specified in the lws-width option. The valid value should be none, or, any combination of cr(carriage return), lf(line feed), or sp(space). The default value is none.

#### lws-width

Specifies the maximum number of columns that a header that is inserted into an HTTP request can have. The default value is 80.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### oneconnect-transformations

Specifies whether the system performs HTTP header transformations for the purpose of keeping server-side connections open. The default value is enabled. This feature requires configuration of a OneConnect(tm) profile.

#### partition

Displays the partition within which the component resides.

#### redirect-rewrite

Specifies which of the application HTTP redirects the system rewrites to HTTPS. The options are:

all Specifies to rewrite all application redirects to HTTPS.

#### matching

Specifies to rewrite to HTTPS only application redirects that match the original URI exactly.

#### nodes

If the URI contains a node IP address, instead of a host name, specifies that the system rewrites the node IP address to the virtual server IP address.

none Specifies that the system does not rewrite to HTTPS any application HTTP redirects. This is the default value.

Use this feature when an application is generating HTTP redirects that send the client to HTTP (a non-secure channel) when you want the client to continue accessing the application using HTTPS (a secure channel). This is a common occurrence when using client SSL processing on a BIG-IP system.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### request-chunking

Specifies how to handle chunked and unchunked requests. The default value is preserve. The options are described under response-chunking.

#### response-chunking

Specifies how to handle chunked and unchunked responses. The default value is selective. The options are:

#### unchunk

If the request or response is chunked, this option unchunks the request or response, processes the HTTP content, and passes the request or response on as unchunked. The Keep-Alive value for the Connection header is not supported, and therefore the system sets the value of the header to close.

If the request or response is unchunked, the LTM system processes the HTTP content and passes the request or response on untouched.

#### rechunk

If the request or response is chunked, the system unchunks the request or response, processes the HTTP content, re-adds the chunk trailer headers, and then passes on the request or response as chunked. Any chunk extensions are lost.

If the request or response is unchunked, the system adds transfer encoding and chunking headers on egress.

#### preserve

If the request or response is chunked or unchunked, the system leaves the request or response chunked, processes the HTTP content, and passes the request or response on untouched.

#### selective

If the request or response is chunked, the system unchunks the request or response, processes the HTTP content, re-adds the chunk trailer headers, and then passes on the request or response as chunked. Any chunk extensions are lost.

If the request is unchunked, the system processes the HTTP content, and then passes on the request or response untouched.

#### response-headers-permitted

Specifies headers that the BIG-IP system allows in an HTTP response. The default value is none.

#### explicit-proxy

Specifies explicit settings for the HTTP profile:

#### enabled

Specifies whether the explicit proxy service is enabled or disabled. The default is no.

#### dns-resolver

Specifies the dns-resolver object that will be used to resolve hostnames in proxy requests. The default is dns-resolver.

#### tunnel-name

Specifies the tunnel that will be used for outbound proxy requests. This enables other virtual servers to receive connections initiated by the proxy service. The default is http-tunnel.

#### route-domain

Specifies the route-domain that will be used for outbound proxy requests. The default is 0.

#### default-connect-handling

Specifies the behavior of the proxy service for CONNECT requests. If set to deny, CONNECT requests will only be honored if there is another virtual server listening for the requested outbound connection. If set to allow outbound connections will be made regardless of other virtual servers. The default is deny.

#### host-names

Specifies the which host names are to be treated as local. Proxy requests made for those hosts will be treated as regular HTTP requests and will be sent to the configured default pool.

#### connect-error-message

Specifies the error message that will be returned to the browser when a proxy request can't be completed because of a failure to establish the outbound connection.

#### dns-error-message

Specifies the error message that will be returned to the

browser when a proxy request can't be completed because of a failure to resolve the hostname in the request.

#### bad-request-message

Specifies the error message that will be returned to the browser when a proxy request can't be completed because the request was malformed.

#### bad-response-message

Specifies the error message that will be returned to the browser when a proxy request can't be completed because the response was malformed.

#### sflow

Specifies sFlow settings for the HTTP profile:

#### poll-interval

Specifies the maximum interval in seconds between two pollings. The default value is 0. To enable this setting, you must also set the poll-interval-global setting to no.

#### poll-interval-global

Specifies whether the global HTTP poll-interval setting, which is available under sys sflow global-settings module, overrides the object-level poll-interval setting. The default value is yes.

The available values are:

no Specifies to use the object-level poll-interval setting.

yes Specifies to use the global HTTP poll-interval setting.

#### sampling-rate

Specifies the ratio of packets observed to the samples generated. For example, a sampling rate of 2000 specifies that 1 sample will be randomly generated for every 2000 packets observed. The default value is 0. To enable this setting, you must also set the sampling-rate-global setting to no.

#### sampling-rate-global

Specifies whether the global HTTP sampling-rate setting, which is available under sys sflow global-settings module, overrides the object-level sampling-rate setting. The default value is yes.

The available values are:

no Specifies to use the object-level sampling-rate setting.

yes Specifies to use the global HTTP sampling-rate setting.

#### via-host-name

Specifies the hostname that will be used in the Via: HTTP header. See via-request and via-response for how the Via: header will be handled. If either via-request or via-response are set to append, then this is required.

#### via-request

Specifies how you want to process Via: HTTP header in requests sent to OWS. The default setting is remove. The available values are:

#### append

The value from via-host-name is appended to the Via: HTTP header.

#### preserve

Via: HTTP header is preserved without changes.

#### remove

Via: HTTP header is removed from the request.

#### via-response

Specifies how you want to process Via: HTTP header in responses sent to clients. The default setting is remove. The available values are the same as in via-request.

#### server-agent-name

Specifies the string used as the server name in traffic generated by LTM. The default value is BigIP.

#### alternative-xff-names

Specifies alternative XFF headers instead of the default X-forwarded-for header.

#### hsts Specifies HSTS settings for the HTTP profile:

mode Specifies if the HSTS settings are enabled or disabled. The default is disabled.

#### maximum-age

Specifies the maximum age to be sent in the HSTS header. The default is 16070400.

#### include-subdomains

Specifies if the includeSubdomains directive is sent in the HSTS header. The default is enabled.

#### preload

Specifies if the preload directive is sent in the HSTS header. The default is disabled.

## ltm profile http2

### NAME

http2 - Configures a HTTP/2 protocol profile.

### MODULE

ltm profile

### SYNTAX

Configure the http2 component within the ltm profile module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
create http2 [name]
modify http2 [name]
options:
  activation-modes { [npn | alpn | always] ... }
  concurrent-streams-per-connection [integer]
  connection-idle-timeout [integer]
  defaults-from [ [name] | none]
  description [string]
  frame-size [integer]
  insert-header [disabled | enabled]
  insert-header-name ["string"]
  receive-window [integer]
  write-size [integer]
  header-table-size [integer]
```

#### DISPLAY

```
list http2
list http2 [ [ [name] | [glob] | [regex] ] ... ]
show running-config http2
show running-config http2 [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show http2
show http2 [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global
```

#### DELETE

```
delete http2 [name]
```

### DESCRIPTION

You can use the http2 component to create, modify, display, or delete a HTTP/2 profile.

The BIG-IP(r) system installation includes the following default HTTP/2-type profiles:

http2

The default HTTP/2 profile contains values for properties related to managing HTTP/2 traffic.

You can create a new HTTP/2-type profile using an existing profile as a parent profile, and then you can change the values of the properties to suit your needs.

### EXAMPLES

```
create http2 my_http2_profile defaults-from http2
```

### OPTIONS

activation-modes

Specifies what will cause a connection to be treated as a HTTP/2 connection. The values npn and alpn specify that the TLS next-protocol-negotiation and application-layer-protocol-negotiation will be used to determine whether HTTP/2 should be activated. Clients that use TLS, but only support HTTP will work as-if HTTP/2 is not present. The value always specifies that all connections

are assumed to be HTTP/2 connections. The default value is { npn alpn }.

**concurrent-streams-per-connection**  
Specifies how many concurrent requests are allowed to be outstanding on a single HTTP/2 connection.

**connection-idle-timeout**  
Specifies how many seconds a HTTP/2 connection is left open idly before it is shutdown.

**defaults-from**  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is http2.

**description**  
User defined description.

**frame-size**  
Specifies the size of the data frames, in bytes, that HTTP/2 will send to the client. Larger frame sizes will improve network utilization, but may affect concurrency. The default value is 2048.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**insert-header**  
Specifies whether an HTTP header that indicates the use of HTTP/2 should be inserted in the request going to the back-end server. The default value is disabled.

**insert-header-name**  
Specifies the name of the HTTP header controlled by insert-header. The default value is "X-HTTP2".

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**receive-window**  
Specifies the receive window, in KB. The receive window is a mechanism used by HTTP/2 to perform flow control. The receive window allows HTTP/2 to stall individual upload streams when needed. This mechanism is available only for HTTP/2 version 3. The default value is 32.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**write-size**  
Specifies the total size of combined data frames, in bytes, HTTP/2 will send in a single write. This controls the size of the TLS records when HTTP/2 is used over SSL. A large write size will cause HTTP/2 to buffer more data, but will improve network utilization. The default value is 16384.

**header-table-size**  
Specifies the size of the header table, in bytes. The HTTP/2 protocol compresses http headers to save bandwidth. A larger table will allow better compression, at the cost of more memory usage. The default value is 4096 bytes. This is currently unused.

## ltm profile icap

**NAME**  
icap - Configures an Internet Content Adaptation Protocol (ICAP) profile.

**MODULE**  
ltm profile

## SYNTAX

Configure the icap component within the ltm profile module using the syntax shown in the following sections.

```
CREATE/MODIFY
create icap [name]
modify icap [name]
options:
  defaults-from [ [name] | none]
  description [string]
  header-from [string]
  host [string]
  preview-length [integer]
  referer [string]
  uri [string]
  user-agent [string]

edit icap [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

mv icap [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]] ]
options:

## DESCRIPTION

You can use the icap component to manage an Internet Content Adaptation Protocol profile.

## EXAMPLES

```
create icap my_icap defaults-from icap
```

Creates an internet content adaptation protocol profile named `my_icap` using the system defaults.

```
create icap my_icap { uri icap://mycompany.com/ad_insertion/ }
```

Creates an internet content adaptation protocol profile named `my_icap` that uses `icap://mycompany.com/ad_insertion/` as the ICAP URI.

```
mv icap /Common/my_icap_profile to-folder /Common/my_folder
```

Moves a custom icap profile named `my_icap_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all of the settings and values from the specified parent profile. The default value is `icap`.

### description

User defined description.

### header-from

Specifies the header-from attribute to use in the ICAP header. Please refer to RFC 3507 section 4.3.2.

**host** Specifies the host attribute to use in the ICAP header. Please refer to RFC 3507 section 4.3.2i.

### preview-length

Specifies the ICAP data preview size. Please refer to RFC 3507 section 4.5.

### referer

Specifies the referer attribute to use in the ICAP header. Please refer to RFC 3507 section 4.3.2.

### to-folder

icap profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

**uri** Specifies the ICAP URI to use in the ICAP header. Please refer to RFC 3507 section 4.2. Macro expansion has been implemented for all attributes values in the ICAP header. If an ICAP header attribute value contains `${SERVER_IP}`, the macro will be replaced with the IP address of the ICAP server selected from the internal virtual server's pool. If an ICAP header attribute contains

`{SERVER_PORT}`, the macro will be replaced with the port of the ICAP server selected from the internal virtual server's pool. For example, the URI attribute in an ICAP profile could be set to `icap://{SERVER_IP}:{SERVER_PORT}/videoOptimization`.

**user-agent**  
Specifies the user-agent attribute to use in the ICAP header. Please refer to RFC 3507 section 4.3.2.

**SEE ALSO**

`create`, `delete`, `edit`, `glob`, `list`, `ltm virtual`, `modify`, `mv`, `regex`, `reset-stats`, `show`, `tmsh`, `ltm profile response-adapt`

## ltm profile iiop

**NAME**  
iiop - Configures an Internet Inter-Orb Protocol (IIOP) profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the iiop component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**

```
create iiop [name]
modify iiop [name]
options:
  abort-on-timeout [disabled | enabled]
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  persist-object-key [disabled | enabled]
  persist-request-id [disabled | enabled]
  timeout [integer]
```

```
edit iiop [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
reset-stats iiop
reset-stats iiop [name]
```

**DISPLAY**

```
list iiop
list iiop [ [ [name] | [glob] | [regex] ] ... ]
show running-config iiop
show running-config iiop [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
show iiop
show iiop [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global
```

**DELETE**

```
delete iiop [name]
```

**DESCRIPTION**

You can use the iiop component to manage IIOP network traffic. The system parses the incoming TCP stream, disaggregates it into IIOP messages, and performs load balancing and persistence based on the parameters you set.

**EXAMPLES**

```
create iiop my_iiop_profile defaults-from iiop
```

Creates an IIOP profile named `my_iiop_profile` that inherits its settings from the system default IIOP profile named `iiop`.

```
list iiop all-properties
```

Displays all properties for all IIOP profiles.

#### OPTIONS

**abort-on-timeout**

Specifies whether the system aborts the connection if there is no response received within the time specified in the timeout option. The default value is disabled.

**app-service**

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

**defaults-from**

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is iiop.

**description**

User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**

Displays the administrative partition within which this profile resides.

**persist-object-key**

Specifies whether to persist connections based on the object key in the IIOP request. The default value is disabled.

**persist-request-id**

Specifies whether to persist connections based on the request ID in the IIOP request. The default value is enabled.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**timeout**

Specifies the request timeout. The system uses this value when the abort-on-timeout option is enabled. The default value is 30 seconds.

## ltm profile ilx

#### NAME

ilx - Configures an ILX profile.

#### MODULE

ltm profile

#### SYNTAX

Configure the ilx component within the ltm profile module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
create ilx [name]
modify ilx [name]
options:
  app-service [[string] | none]
  defaults-from [[name] | none]
  description [string]
  plugin [string]
```

```
edit ilx [ [name] | [glob] | [regex] ] ... ]
options:
```

all-properties  
non-default-properties

DISPLAY  
list ilx  
list ilx [ [ [name] | [glob] | [regex] ] ... ]  
show running-config ilx  
show running-config ilx [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

DELETE  
delete ilx [name]

#### DESCRIPTION

You can use the ilx component to create, modify, display, or delete an ILX profile. An ILX profile is used to associate an ILX Plugin (see ilx plugin) with a virtual server. When a client connects to a virtual server the data from the client and server will be routed to the ILX plugin allowing the plugin to inspect and manage traffic. An ILX profile is compatible with the following virtual server profiles: tcp, http, clientssl and serverssl. A plugin may be associated with at most one ILX profile. An ILX profile may be associated with multiple virtual servers.

The BIG-IP(r) system installation includes the following default ILX profiles:

ilx

#### EXAMPLES

```
create ilx my_ilx_profile defaults-from ilx
```

Creates a custom ILX profile named my\_ilx\_profile that inherits its settings from the system default ILX profile.

#### OPTIONS

app-service  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile. The default value is ilx.

description  
User defined description.

mpi-channel  
Displays the communication channel used by the TMM and Node.js process.

partition  
Displays the administrative partition within which the profile resides.

plugin  
The name of an ILX Plugin, see also ilx plugin.

#### SEE ALSO

create, delete, edit, glob, ilx plugin, ilx workspace, list, ltm virtual, modify, regex, show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## ltm profile ipother

NAME  
ipother - Configures a generic IP profile for non-TCP and non-UDP traffic.

MODULE  
ltm profile

SYNTAX

Configure the ipother component within the ltm profile module using the syntax shown in the following sections.

```
CREATE/MODIFY
create ipother [name]
modify ipother [name]
  options:
    app-service [[string] | none]
    defaults-from [[name] | none]
    description [string]
    idle-timeout [immediate | indefinite | integer]

edit ipother [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

reset-stats ipother
reset-stats ipother [ [ [name] | [glob] | [regex] ] ... ]

DISPLAY
list ipother
list ipother [ [ [name] | [glob] | [regex] ] ... ]
show running-config ipother
show running-config ipother
  [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

show ipother
show ipother [ [ [name] | [glob] | [regex] ] ... ]
  options:
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    field-fmt
    global

DELETE
delete ipother [name]

DESCRIPTION
  You can use the ipother component to manage non-TCP and non-UDP network
  traffic. If you want to manage TCP or UDP traffic, then use the
  appropriate TCP or UDP LTM profiles.

EXAMPLES
  create ipother my_ipother_profile defaults-from ipother

  This creates a custom IP-OTHER profile that is named my_ipother_profile
  which inherits its settings from the system default IP-OTHER profile.

  list ipother all-properties

  Displays all properties for all IP-OTHER profiles.

OPTIONS
  app-service
  Specifies the name of the application service to which the profile
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the profile. Only the application
  service can modify or delete the profile.

  defaults-from
  Specifies the profile that you want to use as the parent profile.
  Your new profile inherits all settings and values from the parent
  profile. The default value is ipother.

  description
  User defined description.

  glob
  Displays the items that match the glob expression. See help glob
  for a description of glob expression syntax.

  idle-timeout
  Specifies the number of seconds that a connection is idle before
  the connection is eligible for deletion. The default value is 60
  seconds.

  name
  Specifies a unique name for the component. This option is required
  for the commands create, delete, and modify.

  partition
  Displays the administrative partition within which the profile
  resides.

  regex
  Displays the items that match the regular expression. The regular
  expression must be preceded by an at sign (@[regular expression])
  to indicate that the identifier is a regular expression. See help
  regex for a description of regular expression syntax.

SEE ALSO
  create, delete, edit, glob, ltm profile, ltm virtual, modify, show,
  regex, reset-stats, tmsh
```

#### COPYRIGHT

## ltm profile ipsecalg

**NAME**  
ipsecalg - Configures a IPsecALG profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the ipsecalg component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create ipsecalg [name]  
modify ipsecalg [name]  
options:  
app-service [[string] | none]  
defaults-from [ [name] | none]  
description [string]  
idle-timeout [integer]  
pending-ike-connection-limit [integer]  
initial-connection-timeout [integer]  
log-publisher [log publisher name | none]  
log-profile [log profile name | none]

mv ipsecalg [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder options:  
to-folder

edit ipsecalg [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list ipsecalg  
list ipsecalg [ [ [name] | [glob] | [regex] ] ... ]  
show running-config ipsecalg  
show running-config ipsecalg [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

**DELETE**  
delete ipsecalg [name]

**DESCRIPTION**  
Use this command to create, modify, display, or delete an IPsecALG profile with which you can manage IPsecALG traffic.

**EXAMPLES**  
create ipsecalg my\_ipsecalg\_profile defaults-from ipsecalg  
Creates a custom IPsecALG profile named my\_ipsecalg\_profile that inherits its settings from the system default IPsecALG profile.  
list ipsecalg  
Displays the properties of all IPsecALG profiles.  
mv ipsecalg /Common/my\_ipsecalg\_profile to-folder /Common/my\_folder  
Moves a custom IPsecALG profile named my\_ipsecalg\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.  
defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is ipsecalg.  
description  
User defined description.  
glob Displays the items that match the glob expression. See help glob

for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**to-folder**  
ipsecalg profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**idle-timeout**  
Specifies an idle timeout in seconds. This setting specifies the number of seconds that a connection is idle before the connection is eligible for deletion. The default value is 3600 seconds.

**pending-ike-connection-limit**  
Specifies the the maximum number of unacknowledged IKE connections a client can have before being denied further requests to prevent a single client from flooding all the connections trying to establish the connections. The default value is 5 connections per client.

**initial-connection-timeout**  
Specifies an initial connection timeout in seconds. This is the max number of seconds to wait for a response from the server for the IKE/IPsec request. The default value is 3 seconds.

**log-publisher**  
Specify the name of the log publisher which logs translation events. See help sys log-config for more details on the logging sub-system. Use the "sys log-config publisher" component to set up a log publisher.

**log-profile**  
Specify the name of the ALG log profile which controls the logging of ALG events. See help ltm alg-log-profile for more details on the logging profile sub-system. Use the "ltm alg-log-profile profile" component to set up an ALG log profile.

## ltm profile mapt

**NAME**  
map-t - Configures a MAP-T tunnel profile.

**MODULE**  
net tunnels

**SYNTAX**  
Configure the map-t component within the ltm profile module using the syntax in the following sections.

**CREATE/MODIFY**  
create map-t [name]  
modify map-t [name]  
options:  
  app-service [[string] | none]  
  defaults-from [ [name] | none]  
  description [string]  
  ip6-prefix [ipv6 address/netmask]  
  ip4-prefix [ipv4 address/netmask]  
  ea-bits-length [integer]  
  port-offset [integer]  
  br-prefix [ipv6 address/netmask]  
edit map-t [ [name] | [glob] | [regex] ] ... ]  
options:

all-properties  
non-default-properties

#### DISPLAY

```
list map-t  
list map-t [ [ [name] | [glob] | [regex] ] ... ]  
show running-config map-t  
show running-config map-t [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
app-service  
non-default-properties  
one-line  
partition
```

#### DELETE

```
delete map-t [ all | [name] ]
```

#### DESCRIPTION

You can use the map-t component to create a MAP-T profile that you associate with an LTM Virtual. A map-t profile allows you to define NAT parameters which will allow legacy IPv4 servers to connect to an IPv6 network.

#### EXAMPLES

```
create map-t my_map
```

Creates a MAP-T profile called my\_map.

```
list map-t all-properties
```

Displays all the properties of all the MAP-T profiles.

#### OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is mapt.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which this component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

ip6-prefix

Specifies the Rule IPv6 Prefix and netmask using CIDR notation, such as 2014::/48. The default prefix length is 48.

ip4-prefix

Specifies the Rule IPv4 Prefix and netmask using CIDR notation, such as 192.0.0.0/8. The default prefix length is 8.

ea-bits-length

Specifies the Rule EA (Embedded Address) Length of the MAP-T domain. The default is 40 (IPv4 32 bits + PSID 8 bits).

port-offset

Specifies the port offset bits length of the MAP-T domain. The default is 6.

br-prefix

Specifies the BR (Border Relay) IPv6 prefix and netmask using CIDR notation, such as 2023::/96. The default prefix length is 96.

psid Specify PSID value for MAP-T. The default is zero.

draft-mode

Allow BIGIP to work with non rfc compliant CE devices which map BR prefix at a wrong offset. The default is to disable draft mode.

br-pfx-ignore

Allow BIGIP to work with non rfc compliant CE devices which ignore BR prefix lengths. The default is to disable.

#### SEE ALSO

create, delete, edit, glob, list, modify, net tunnels tunnel, regex, show, tmsh

#### COPYRIGHT

## ltm profile mblb

**NAME**  
mblb - Configures an MBLB profile (experimental).

**MODULE**  
ltm profile

**SYNTAX**  
Configure the mblb component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create mblb [name]  
modify mblb [name]  
options:  
app-service [[string] | none]  
defaults-from [ [name] | none]  
description [string]  
isolate-abort [disabled | enabled]  
isolate-expire [disabled | enabled]  
isolate-server [disabled | enabled]  
isolate-client [disabled | enabled]  
egress-high [# of messages]  
egress-low [# of messages]  
ingress-high [# of messages]  
ingress-low [# of messages]  
min-conn [# of connections]  
tag-ttl [# of seconds]  
shutdown-timeout [# of seconds]

edit mblb [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list mblb  
list mblb [ [ [name] | [glob] | [regex] ] ... ]  
show running-config mblb  
show running-config mblb [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DELETE**  
delete mblb [name]

**DESCRIPTION**  
Use this command to create, modify, display, or delete an MBLB profile with which you can customize MBLB behavior.

**EXAMPLES**  
create mblb my\_mblb\_profile defaults-from mblb  
  
Creates a custom MBLB profile named my\_mblb\_profile that inherits its settings from the system default MBLB profile.  
  
list mblb  
  
Displays the properties of all MBLB profiles.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.  
  
defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is mblb.  
  
description  
User defined description.  
  
glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.  
  
name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.  
  
regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**isolate-abort**  
Specify whether to isolate abort event propagation.

**isolate-expire**  
Specify whether to isolate expiration event propagation.

**isolate-server**  
Specify whether to isolate serverside shutdown event propagation. This also dominate serverside abort/expiration event propagation.

**isolate-client**  
Specify whether to isolate clientside shutdown event propagation. This also dominate clientside abort/expiration event propagation.

**egress-high**  
Specify the high water mark for egress message queue. The default value is 50.

**egress-low**  
Specify the low water mark for egress message queue. The default value is 5.

**ingress-high**  
Specify the high water mark for ingress message queue. The default value is 50.

**ingress-low**  
Specify the low water mark for ingress message queue. The default value is 5.

**min-conn**  
Specify the minimum number of serverside connections. The default value is 0.

**tag-ttl**  
Specify the TTL (time to live) for message TAG. The default value is 60.

**shutdown-timeout**  
Delays sending FIN when BIGIP receives the first FIN packet from either the client or the server. Value of 0 means send FIN immediately otherwise the minimum of tcp idle timeout and shutdown timeout is used. The default value is 5 seconds

DELETE
delete mssql [name]

DESCRIPTION
  You can use the mssql component to configure a profile to manage
  mssql(tds) database traffic.

EXAMPLES
  create mssql my_mssql_profile defaults-from mssql

  Creates a mssql profile named my_mssql_profile that inherits its
  settings from the system default mssql profile.

  list mssql

  Displays the properties of all mssql profiles.

OPTIONS
  app-service
  Specifies the name of the application service to which the profile
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the profile. Only the application
  service can modify or delete the profile.

  defaults-from
  Specifies the profile that you want to use as the parent profile.
  Your new profile inherits all settings and values from the parent
  profile specified. The default value is mssql.

  partition
  Displays the administrative partition within which the profile
  resides.

  read-pool
  Specifies the pool of MS SQL database servers to which the system
  sends ready-only requests.

  read-write-split-by-command
  When enabled, the system decides which pool to send the client
  requests the by the content in the message. It can only be enabled
  when read-write-split-by-user is disabled.

  read-write-split-by-user
  When enabled, the system decides which pool to send the client
  requests the by user name. It can only be enabled when read-write-
  split-by-command is disabled.

  user-can-write-by-default
  Specifies whether users have write access by default. When set to
  true, all users have write access, except those added to the users
  list.

  user-list
  Specifies the users who have read-only access to the MS SQL if
  user-can-write-by-default is true, or the users who have write
  access to the MS SQL database if user-can-write-by-default is
  false.

  write_persist_timer
  Specify how many minimum time in milliseconds the connection will
  be persisted to write-pool after connection switch to write pool.

  write-pool
  Specifies the pool of MS SQL database servers to which the system
  sends requests that are not read-only.

one-line  
partition  
show netflow  
show netflow [ [ [name] | [glob] | [regex] ] ... ]  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
field-fmt

**DELETE**  
delete netflow [name]

**DESCRIPTION**  
You can use the netflow component to manage a NETFLOW profile.

**EXAMPLES**  
create netflow my\_netflow\_profile defaults-from netflow  
Creates a NETFLOW profile named my\_netflow\_profile using the system defaults.  
create netflow my\_netflow\_profile { netflow-version version-5 }  
Creates a NETFLOW profile named my\_netflow\_profile that specifies the maximum number of messages that can be held in the ingress queue is 1000.  
mv netflow /Common/my\_netflow\_profile to-folder /Common/my\_folder  
Moves a custom netflow profile named my\_netflow\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.  
defaults-from  
Specifies the profile that you want to use as the parent profile.

Your new profile inherits all of the settings and values from the specified parent profile. The default value is netflow.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**netflow-version**  
Specifies the expected netflow version for a profile.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

## ltm profile ntlm

**NAME**  
ntlm - Configures a Microsoft(r) Windows(r) NT Local Area Network (LAN) manager profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the ntlm component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create ntlm [name]  
modify ntlm [name]  
options:  
app-service [[string] | none]  
defaults-from [name]  
description [string]  
insert-cookie-domain [domain]  
insert-cookie-name [cookie name]  
insert-cookie-passphrase [passphrase]  
key-by-cookie [disabled | enabled]  
key-by-cookie-name [cookie name]  
key-by-domain [disabled | enabled]  
key-by-ip-address [disabled | enabled]  
key-by-target [disabled | enabled]  
key-by-user [disabled | enabled]  
key-by-workstation [disabled | enabled]  
  
edit ntlm [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
  
**DISPLAY**  
list ntlm  
list ntlm [ [ [name] | [glob] | [regex] ] ... ]  
show running-config ntlm  
show running-config ntlm [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition  
  
**DELETE**  
delete ntlm [name]

**DESCRIPTION**

You can use the ntlm component to create a Microsoft Windows NT LAN manager (NTLM) profile to manage servers on the LAN that are running Windows NT.

#### EXAMPLES

```
create ntlm my_ntlm_profile defaults-from ntlm
```

Creates a Microsoft Windows NT LAN manager profile named my\_ntlm\_profile that inherits its settings from the system default NTLM profile named ntlm.

```
list ntlm all-properties
```

Displays all properties for all NTLM profiles.

#### OPTIONS

**app-service**

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

**defaults-from**

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is ntlm.

**description**

User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**insert-cookie-domain**

Specifies an optional domain for the inserted cookie. The default is none, which causes no domain to be configured for the inserted cookie.

**insert-cookie-name**

Specifies a cookie name that the system inserts in the cookie. The default value is NTLMconnpool.

**insert-cookie-passphrase**

Specifies a cookie passphrase that the system inserts in the cookie. The default value is mypassphrase.

**key-by-cookie**

Specifies whether the system uses the existing cookie as the key. The default value is disabled.

**key-by-cookie-name**

Specifies whether the system uses the value of the insert-cookie-name option as the key. The default value is mycookie.

**key-by-domain**

Specifies whether the system uses the NTLM domain as the key. The default value is disabled.

**key-by-ip-address**

Specifies whether the system uses the client IP address as the key. The default value is disabled.

**key-by-target**

Specifies whether the system uses the NTLM target as the key. The default value is disabled.

**key-by-user**

Specifies whether the system uses the NTLM user as the key. The default value is enabled.

**key-by-workstation**

Specifies whether the system uses the NTLM workstation as the key. The default value is disabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

## ltm profile one-connect

**NAME**  
one-connect - Configures a OneConnect(tm) profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the one-connect component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create one-connect [name]  
modify one-connect [name]  
options:  
app-service [[string] | none]  
defaults-from [name]  
description [string]  
idle-timeout-override [disabled | enabled]  
share-pools [disabled | enabled]  
max-age [integer]  
max-reuse [integer]  
max-size [integer]  
source-mask [ip address]  
limit-type [none|idle|strict]

edit one-connect [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

mv one-connect [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [fol  
options:  
to-folder

reset-stats one-connect  
reset-stats one-connect[ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
list one-connect  
list one-connect [ [name] | [glob] | [regex] ] ... ]  
show running-config one-connect  
show running-config one-connect [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

show one-connect  
show one-connect [ [name] | [glob] | [regex] ] ... ]  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
field-fmt  
global

**DELETE**  
delete one-connect [name]

**DESCRIPTION**  
You can use the one-connect component to create a OneConnect profile

that optimizes connections by improving client performance and increasing server capacity.

#### EXAMPLES

```
create one-connect my_OC_profile defaults-from oneconnect
```

Creates a OneConnect profile named my\_OC\_profile that inherits its settings from the system default OneConnect profile named oneconnect.

```
list one-connect all-properties
```

Displays all properties for all OneConnect profiles.

```
mv one-connect /Common/my_oneconnect_profile to-folder  
/Common/my_folder
```

Moves a custom one-connect profile named my\_oneconnect\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is oneconnect.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

idle-timeout-override

Specifies the number of seconds that a connection is idle before the connection flow is eligible for deletion. The default value is disabled.

share-pools

Indicates that connections may be shared not only within a virtual server, but also among similar virtual servers (e.g. those that differ only in destination address). When enabled, all virtual servers that use the same One Connect and other internal network profiles can share connections.

max-age

Specifies the maximum age, in number of seconds, of a connection in the connection reuse pool. For any connection with an age higher than this value, the system removes that connection from the reuse pool. The default value is 86400.

max-reuse

Specifies the maximum number of times that a server connection can be reused. The default value is 1000.

max-size

Specifies the maximum number of connections that the system holds in the connection reuse pool. If the pool is already full, then the server connection closes after the response is completed. The default value is 10000.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the partition within which the component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

source-mask

Specifies a source IP mask. The default value is 0.0.0.0.

The system applies the value of this option to the source address to determine its eligibility for reuse. A mask of 0.0.0.0 causes the system to share reused connections across all clients. A host mask (all 1's in binary), causes the system to share only those reused connections originating from the same client IP address.

limit-type

Connection limits with OneConnect are different from straight TCP connection limits. Three options are supported: "none" (the default), "idle", and "strict". When the limit is "none", simultaneous in-flight requests and responses over TCP connections to a pool member are counted toward the limit (this being the historical handling). There may be more TCP connections open to support new requests than there can be simultaneous in-flight requests and responses. This is particularly true when SNAT pools and narrow source address masks are used. When the limit is "idle", idle connections will be dropped as the TCP connection limit is reached. For short intervals, during the overlap of the idle connection being dropped and the new connection being established, the TCP connection limit may be exceeded. When the limit is "strict", the TCP connection limit is honored with no exceptions. This means that idle connections will prevent new TCP

connections from being made until they expire, even if they could otherwise be reused. This is not a recommended configuration except in very special cases with short expiration timeouts.

to-folder  
one-connect profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

show running-config pcp
  [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show pcp
show pcp [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt

DELETE
delete pcp [name]
```

DESCRIPTION

You can use the pcp component to specify Port Control Protocol attributes for a profile that can be used in an LSN pool.

EXAMPLES

```
create pcp my_pcp_profile defaults-from pcp
```

Creates a custom PCP profile named my\_pcp\_profile that inherits its settings from the system default pcp profile.

list pcp all-properties

Displays all properties for all PCP profiles.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none.

Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is pcp, a profile that is shipped in the software.

description

User defined description.

announce-after-failover

Specifies that the BIG-IP software should send an unsolicited ANNOUNCE response to all PCP clients when there is a failover. The unsolicited ANNOUNCE response goes over a link-local multi-cast address, and it contains a new EPOCH time. This signals to the PCP clients that they should renew all of their active mappings.

announce-multicast

Whenever the BIG-IP system reboots, or if there is any possibility that the system lost its PCP-mapping state, it sends an unsolicited ANNOUNCE response to all of its PCP clients. It sends the response over a link-local multi-cast address, and it contains a new EPOCH time. The PCP clients react by renewing all of their active IP mappings. To compensate for possible packet loss (since the multi-cast address is link-local), you can use this property to set the number of multi-cast re-sends. Default is 10 re-sends.

map-filter-limit

A PCP client can request a "filter" for a mapping entry, where the filter limits the number of external endpoints that can use the IP map. The filter request contains the particular IP address and port for the endpoint (or subnet of endpoints), as well as a prefix length. Enter the maximum number of filters (allowed subnets) that clients are allowed to set for each PCP mapping. Default is 1.

map-limit-per-client

Specifies the maximum number of PCP mappings per client. Default is 65535 (unlimited).

Use run util lsndb to see the currently-active set of PCP mappings on the system. See "util lsndb" for details on the LSN DB utility.

map-recycle-delay

After a IP mapping times out (that is, its lifetime expires), there is a further delay before the public-side address and port can be used by another PCP client. Use this property to set the recycle delay. Default is 60 (seconds).

Use run util lsndb to see the currently-active set of PCP mappings on the system. See "util lsndb" for details on the LSN DB utility.

max-mapping-lifetime

When a PCP client requests an IP mapping from a BIG IP system, it also requests a "lifetime" for the mapping. The mapping expires at the end of that lifetime. This property is the maximum number of seconds allowed for a mapping lifetime. Default is 86400 (seconds), or 1 day.

Use run util lsndb to see the currently-active set of PCP mappings on the system. See "util lsndb" for details on the LSN DB utility.

min-mapping-lifetime

Specifies the minimum number of seconds allowed for a mapping lifetime. Default is 600 (seconds), or 10 minutes.

Use run util lsndb to see the currently-active set of PCP mappings on the system. See "util lsndb" for details on the LSN DB utility.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex (regex) for a description of regular expression syntax.

rule Specifies the iRule that is associated with this pcp profile. An iRule can read packets and possibly filter them based on whatever programming logic you design. For example, an iRule could reject all PCP mapping requests using a specific port, or pass an ANNOUNCE request through a specific port. An iRule gives you the flexibility to filter, process, or log the PCP packets that fit this profile.

Select an iRule from the menu of existing iRules. To create a new one, use the create ltm rule command (see "ltm rule").

third-party-allowed-subnets

Specifies the PCP clients that can make MAP requests on behalf of other clients. Enter a collection of IP prefixes (IPv4 or IPv6) with their prefix lengths. If a PCP client outside of any of these subnets attempts a PCP mapping, the BIG-IP software rejects

the mapping.

You can shorten any IPv6 addresses as defined in RFC 2373 (see ).

This list is only used if the third-party-option is also enabled.

If the list is empty and the third-party-option is enabled, any PCP client can create mappings for third parties.

#### third-party-option

Allows PCP clients to make MAP requests on behalf of other clients, using the THIRD\_PARTY flag in the PCP request. You can set this property to enabled or disabled. If you enable this property, we recommend using the third-party-subnets option to limit the the clients that can use the THIRD\_PARTY flag; it is a potential security risk. The default is disabled.

## ltm profile pptp

#### NAME

pptp - Configures a Point-to-Point Tunneling Protocol (PPTP) profile.

#### MODULE

ltm profile

#### SYNTAX

Configure the pptp component within the ltm profile module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
create pptp [name]
modify pptp [name]
options:
  app-service [[string] | none]
  defaults-from [ [name] | none]
  description [[string] | none]
  publisher-name [[string] | none]
  include-destination-ip [disabled | enabled]
  csv-format [disabled | enabled]

edit pptp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

reset-stats pptp
reset-stats pptp [ [ [name] | [glob] | [regex] ] ... ]
```

#### DISPLAY

```
list pptp
list pptp [ [ [name] | [glob] | [regex] ] ... ]
show running-config pptp
show running-config pptp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show pptp
show pptp [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
```

#### DELETE

```
delete pptp [name]
```

#### DESCRIPTION

You can use the pptp component to manage a PPTP profile.

#### EXAMPLES

```
create pptp my_pptp_profile defaults-from pptp

Creates a PPTP profile named my_pptp_profile using the system defaults.
```

```
create ptp my_ptp_profile { log-server-ip disabled }
```

Creates a PPTP profile named `my_ptp_profile` with server address logging disabled.

```
modify ptp my_ptp_profile description "This is a PPTP Profile"
```

Modifies the description attribute of a PPTP profile named `my_ptp_profile`.

#### OPTIONS

##### `app-service`

Specifies the name of the application service to which the object belongs. The default value is none.

##### `defaults-from`

Specifies the profile that you want to use as the parent profile. Your new profile inherits all of the settings and values from the specified parent profile. The default value is `pttp`.

##### `description`

User defined description.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

##### `publisher-name`

Specifies the name of the log publisher for PPTP events.

##### `include-destination-ip`

Specifies whether the log messages for call establishment/disconnect include the server's ip address. The default value is disabled. When disabled the ip address will be displayed as 0.0.0.0.

##### `csv-format`

When enabled, use CSV log format for log entries. The default value is disabled.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

##### `partition`

Displays the administrative partition within which the component resides.

##### `regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm virtual`, `modify`, `regex`, `reset-stats`, `show`, `tmsh`

## ltm profile qoe

#### NAME

`qoe` - Configures a Quality of Experience (QoE) Monitoring profile.

#### MODULE

`ltm profile`

#### SYNTAX

Configure the `qoe` component within the `ltm profile` module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create qoe [name]
```

```
modify qoe [name]
```

##### options:

```
app-service [[string] | none]
```

```
defaults-from [name]
```

```
description [[string] | none]
```

```
video [true | false]
```

```
reset-stats qoe
```

```

reset-stats qoe [ [ [name] | [glob] | [regex] ] ... ]

DISPLAY
list qoe
list qoe [ [ [name] | [glob] | [regex] ] ... ]
show running-config qoe
show running-config qoe [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show qoe
show qoe [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt

DELETE
delete qoe [name]

DESCRIPTION
  You can use the qoe component to monitor Video Quality of Experience.

EXAMPLES
  create qoe my_qoe defaults-from qoe

  Creates an quality of experience profile named my_qoe.

  create qoe my_qoe { video true }

  video
  Specifies to monitor the QoE MOS score of video streams with the
  format of MP4 or FLV.

SEE ALSO
  create, delete, edit, glob, list, ltm virtual, modify, regex, reset-
  stats, show, tmsh, ltm profile qoe

COPYRIGHT
  No part of this program may be reproduced or transmitted in any form or
  by any means, electronic or mechanical, including photocopying,
  recording, or information storage and retrieval systems, for any
  purpose other than the purchaser's personal use, without the express
  written permission of F5 Networks, Inc.

BIG-IP      2014-09-25      ltm profile qoe(1)
```

## ltm profile radius

```

NAME
  radius - Configures a RADIUS profile for network traffic load
  balancing.

MODULE
  ltm profile

SYNTAX
  Configure the radius component within the ltm profile module using the
  syntax shown in the following sections.

CREATE/MODIFY
create radius [name]
modify radius [name]
options:
  app-service [[string] | none]
  clients [add | delete | modify | replace-all-with] {
    [ip address] ...
  }
  clients none
  defaults-from [name]
  description [string]
  persist-avp [ [string] | [integer] | none]
  pem-protocol-profile-radius [ [pem_protocol_profile_radius_name] | none]
  subscriber-discovery [ disabled | enabled ]

mv radius [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-n
options:
  to-folder

edit radius [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

reset-stats radius
reset-stats radius [ [ [name] | [glob] | [regex] ] ... ]

```

```
DISPLAY
list radius
list radius [ [ [name] | [glob] | [regex] ] ... ]
show running-config radius
show running-config radius [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show radius
show radius [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global
```

```
DELETE
delete radius [name]
```

#### DESCRIPTION

You can use the radius component to manage RADIUS network traffic.

#### EXAMPLES

```
create radius my_radius_server
```

Creates a RADIUS profile named `my_radius_server` that inherits its settings from the system default RADIUS profile.

```
delete radius my_radius_server
```

Deletes the RADIUS profile named `my_radius_server`.

```
mv radius /Common/my_radius_profile to-folder /Common/my_folder
```

Moves a custom radius profile named `my_radius_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

##### clients

Specifies host and network addresses from which clients can connect. The default value is none, which indicates that any client can connect.

##### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile. The default value is `radiusLB`.

##### description

User defined description.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

##### partition

Displays the administrative partition within which the component resides.

##### pem-protocol-profile-radius

Specifies PEM protocol profile to be used when subscriber discovery is enabled. PEM protocol profile defines mapping of RADIUS AVPs to subscriber ID and other PEM subscriber session attributes.

##### persist-avp

Specifies the name of the RADIUS attribute on which traffic persists. Acceptable values are ASCII strings from section 5 of RFC 2865 or numeric codes (1-255). The default value is none, which indicates that persistence is disabled.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@`[regular expression]) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

##### subscriber-discovery

Specifies whether to enable PEM subscriber discovery based on the content of RADIUS packets. The options are `disabled` and `enabled`. The default value is `disabled`, which indicates that it will not extract subscriber information from RADIUS packets.

##### to-folder

radius profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm virtual`, `modify`, `mv`, `regex`, `reset-stats`, `show`, `tmsh`

## ltm profile ramcache

### NAME

ramcache - Manages the BIG-IP(r) system RAM cache.

### MODULE

ltm profile

### SYNTAX

Configure the ramcache component within the ltm profile module using the syntax shown in the following sections.

#### DISPLAY

```
show ramcache
show ramcache [ [name] | [glob] | [regex] ] ... ]
options:
  exact
  host [string]
  max-response [integer]
  uri [string]
```

#### DELETE

```
delete ramcache [name]
```

### DESCRIPTION

You can use the ramcache component to delete the entries in or show information about the BIG-IP(r) system RAM cache.

### EXAMPLES

```
show ramcache
```

Displays information about the entries in the BIG-IP system RAM cache.

```
delete ramcache
```

Deletes the entries in the BIG-IP system RAM cache.

### OPTIONS

exact

Displays the exact number of entries in the RAM cache.

host Displays the host from which the entry was cached.

max-response

Displays the maximum number of entries in the RAM cache. The default value is 0 (zero), which is equivalent with no max-response value being specified. Without the max-response option the system will limit the number of entries to 10 per Traffic Management Microkernel (TMM).

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

uri Displays the URI from which the entry was cached.

### SEE ALSO

delete, show, tmsh

## ltm profile request-adapt

**NAME**  
request-adapt - Configures a HTTP request adaptation profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the request-adapt component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create request-adapt [name]  
modify request-adapt [name]  
options:  
defaults-from [ [name] | none ]  
enabled [ yes | no ]  
internal-virtual [ [name] | none ]  
preview-size [integer]  
service-down-action [ ignore | reset | drop ]  
timeout [integer]  
allow-http-10 [ yes | no ]

edit request-adapt [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

mv request-adapt [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [f  
options:  
to-folder

reset-stats request-adapt  
reset-stats request-adapt [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
list request-adapt  
list request-adapt [ [ [name] | [glob] | [regex] ] ... ]  
show running-config request-adapt  
show running-config request-adapt [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

show request-adapt  
show request-adapt [ [ [name] | [glob] | [regex] ] ... ]  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
field-fmt

**DELETE**  
delete request-adapt [name]

**DESCRIPTION**  
You can use the request-adapt component to manage a HTTP request adaptation profile.

**EXAMPLES**  
create request-adapt my\_req\_adapt defaults-from request-adapt  
Creates a HTTP request adaptation profile named my\_req\_adapt using the system defaults.  
create request-adapt my\_req\_adapt { enabled yes }  
Creates a HTTP request adaptation profile named my\_req\_adapt that is enabled for adapting HTTP requests.  
mv request-adapt /Common/my\_requestadapt\_profile to-folder /Common/my\_folder  
Moves a custom request-adapt profile named my\_requestadapt\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.  
defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all of the settings and values from the specified parent profile. The default value is requestadapt.  
enabled  
Enables adaptation of HTTP requests. If set to yes, HTTP requests will be forwarded to the specified internal virtual server for adaptation. The default value is yes.  
internal-virtual  
Specifies the name of the internal virtual server to use for adapting the HTTP request.  
preview-size  
Specifies the maximum size of the preview buffer. The preview buffer is used to hold a copy of the HTTP request header and data sent to the internal virtual server in case the adaptation server reports that it does not need to adapt the HTTP request. Setting the preview-size to 0, disables buffering the request and should

only be done if the adaptation server will always return with a modified HTTP request or the original HTTP request. The default value is 1024.

**service-down-action**

Specifies the action to take if the internal virtual server does not exist or returns an error. The default value is ignore.

The options are:

**ignore**

Ignore the error and send the unmodified HTTP request to a HTTP server selected from this virtual server's pool.

**drop** Drop the connection.

**reset**

Reset the connection.

**timeout**

Specifies a timeout in milliseconds. If the internal virtual server does not return a result within the specified time, a timeout error will occur. A 0 value disables the timeout. The default value is 0.

**to-folder**

request-adapt profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**allow-http-10**

Specifies whether to forward HTTP version 1.0 requests for adaptation. By default only HTTP version 1.1 requests are forwarded. Version 1.0 is not supported. While it should work in most cases, it might be necessary to restrict adaptation on a site-specific basis. The default value is no.

## ltm profile request-log

NAME

request-log - Configures a Request-Logging profile.

MODULE

ltm profile

SYNTAX

Configure the request-log component within the ltm profile module using the syntax shown in the following sections.

CREATE/MODIFY

create request-log [name]

modify request-log [name]

options:

app-service [[string] | none]  
defaults-from [[name] | none]  
description [string]  
log-request-logging-errors [disabled | enabled]  
log-response-by-default [disabled | enabled]  
log-response-logging-error [disabled | enabled]  
proxy-close-on-error [disabled | enabled]  
proxy-respond-on-logging-error [disabled | enabled]  
proxy-response [string]  
request-log-error-pool [ [pool\_name] | none]  
request-log-error-protocol [ TCP | UDP | none]  
request-log-error-template [string]  
request-log-pool [ [pool\_name] | none]  
request-log-protocol [ TCP | UDP | none]  
request-log-template [string]  
request-logging [disabled | enabled]  
response-log-error-pool [ [pool\_name] | none]  
response-log-error-protocol [ TCP | UDP | none]  
response-log-error-template [string]  
response-log-pool [ [pool\_name] | none]  
response-log-protocol [ TCP | UDP | none]  
response-log-template [string]

```

    response-logging [disabled | enabled]

edit request-log [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

mv request-log [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [fol
  options:
    to-folder

DISPLAY
list request-log
list request-log [ [ [name] | [glob] | [regex] ] ... ]
show running-config request-log
show running-config request-log
  [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

show request-log
show request-log [ [ [name] | [glob] | [regex] ] ... ]
  options:
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    field-fmt
    global

DELETE
delete request-log [name]

DESCRIPTION
  You can use the request-log component to manage request-log network
  traffic.

EXAMPLES
  create request-log my_reqlog_profile defaults-from request-log

  Creates a custom request-log profile named my_reqlog_profile that
  inherits its settings from the system default request-log profile.

  list request-log all-properties

  Displays all properties for all request-log profiles.

  mv request-log /Common/my_requestlog_profile to-folder
  /Common/my_folder

  Moves a custom request-log profile named my_requestlog_profile to a
  folder named my_folder, where my_folder has already been created and
  exists within /Common.

OPTIONS
  app-service
  Specifies the name of the application service to which the profile
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the profile. Only the application
  service can modify or delete the profile.

  defaults-from
  Specifies the default values from this profile.

  description
  User defined description.

  log-request-logging-errors
  Enables secondary logging should the primary lack sufficient
  available bandwidth. This mechanism is best used to send an alert
  to a completely separate destination.

  log-response-by-default
  Indicates if response logging may be overridden via iRule. This
  field determines the default response action.

  log-response-logging-errors
  Enables secondary logging should the primary lack sufficient
  available bandwidth. This mechanism is best used to send an alert
  to a completely separate destination.

  partition
  Displays the administrative partition within which the profile
  resides.

  proxy-close-on-error
  Specifies, if enabled, that the logging profile will close the
  connection after sending its proxy-response.

  proxy-respond-on-logging-error
  Specifies that the logging profile respond directly (for example,
  with an HTTP 502) if the logging fails.

  proxy-response
  Specifies the response to send on logging errors.

  regex
  Displays the items that match the regular expression. The regular
  expression must be preceded by an at sign (@[regular expression])
  to indicate that the identifier is a regular expression. See help
  regex for a description of regular expression syntax.

  request-log-error-pool

```

Specifies the name of the pool from which to select log servers.

`request-log-error-protocol`  
Specifies the HighSpeedLogging protocol to use when logging.

`request-log-error-template`  
Specifies the template to use when generating log messages. Shell style escapes (for example, `$foo` and/or `${foo}`) are used to import transaction-specific values.

`request-log-pool`  
Specifies the name of the pool from which to select log servers.

`request-log-protocol`  
Specifies the HighSpeedLogging protocol to use when logging.

`request-log-template`  
Specifies the template to use when generating log messages. Shell style escapes (for example, `$foo` and/or `${foo}`) are used to import transaction-specific values.

`request-logging`  
Enables or disables logging before the response is returned to the client.

`response-log-error-pool`  
Specifies the name of the pool from which to select log servers.

`response-log-error-protocol`  
Specifies the HighSpeedLogging protocol to use when logging.

`response-log-error-template`  
Specifies the template to use when generating log messages. Shell style escapes (for example, `$foo` and/or `${foo}`) are used to import transaction-specific values.

`response-log-pool`  
Specifies the name of the pool from which to select log servers.

`response-log-protocol`  
Specifies the HighSpeedLogging protocol to use when logging.

`response-log-template`  
Specifies the template to use when generating log messages. Shell style escapes (for example, `$foo` and/or `${foo}`) are used to import transaction-specific values.

`response-logging`  
Enables or disables logging before the response is returned to the client.

`to-folder`  
request-log profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

        field-fmt

DELETE
delete response-adapt [name]

```

#### DESCRIPTION

You can use the response-adapt component to manage a HTTP response adaptation profile.

#### EXAMPLES

```
create response-adapt my_req_adapt defaults-from response-adapt
```

Creates a HTTP response adaptation profile named my\_req\_adapt using the system defaults.

```
create response-adapt my_req_adapt { enabled yes }
```

Creates a HTTP response adaptation profile named my\_req\_adapt that is enabled for adapting HTTP responses.

```
mv response-adapt /Common/my_responseadapt_profile to-folder
/Common/my_folder
```

Moves a custom responseadapt profile named my\_responseadapt\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all of the settings and values from the specified parent profile. The default value is responseadapt.

#### enabled

Enables adaptation of HTTP responses. If set to yes, HTTP responses will be forwarded to the specified internal virtual server for adaptation. The default value is yes.

#### internal-virtual

Specifies the name of the internal virtual server to use for adapting the HTTP response.

#### preview-size

Specifies the maximum size of the preview buffer. The preview buffer is used to hold a copy of the HTTP response header and data sent to the internal virtual server in case the adaptation server reports that it does not need to adapt the HTTP response. Setting the preview-size to 0, disables buffering the response and should only be done if the adaptation server will always return with a modified HTTP response or the original HTTP response. The default value is 1024.

#### service-down-action

Specifies the action to take if the internal virtual server does not exist or returns an error. The default value is ignore.

The options are:

#### ignore

Ignore the error and send the unmodified HTTP response to a HTTP server selected from this virtual server's pool.

drop Drop the connection.

#### reset

Reset the connection.

#### timeout

Specifies a timeout in milliseconds. If the internal virtual server does not return a result within the specified time, a timeout error will occur. A 0 value disables the timeout. The default value is 0.

```

    host [string]
    port [string]
    path [string]
}
server {
    scheme [string]
    host [string]
    port [string]
    path [string]
}
}
}

edit rewrite [ [ [name] | [glob] ] ... ]
options:
    all-properties
    non-default-properties

DELETE
delete rewrite [name]

DESCRIPTION
    Use the rewrite component to configure a Rewrite Profile in URI
    Translation or Portal (Access) mode.

EXAMPLES

URI Translation Mode
Create a profile
    create my_uri_rewrite rewrite-mode uri-translation

Add a rule to rewrite URIs
    modify my_uri_rewrite uri-rules add { my_rule { client { path
    /client/ } server { path /server/ } } }

    modify my_uri_rewrite uri-rules add { my_rule { client { scheme
    http host www.client.com path / } server { scheme http host
    www.server.com path / } } }

Add a rule to rewrite Set-Cookie headers
    modify my_uri_rewrite set-cookie-rules add { my_rule { client {
    domain client.com path / } server { domain server.com path / }
    } }

Portal (Access) Mode
Create a profile
    create my_portal_rewrite rewrite-mode portal

Configure the client to cache all files
    modify my_portal_rewrite client-caching-type cache-all

Set the rewrite list and bypass list
    modify my_portal_rewrite rewrite-list add {
    *://www.myportal.com/* http://abc*.com/* } bypass-list add {
    *://external_web.com/* }

Configure split-tunneling
    modify my_portal_rewrite split-tunneling true

OPTIONS

app-service
    Specifies the name of the application service to which the
    object belongs. The default value is none. Note: If the strict-
    updates option is enabled on the application service that owns
    the object, you cannot modify or delete the object. Only the
    application service can modify or delete the object.

bypass-list
    Specifies a list of URIs that are bypassed inside a web page
    when the page is accessed using Portal Access. The default is
    none.

client-caching-type
    Specifies one of four options for client caching. When the
    Client Cache setting for a web application resource is set to
    default, the system uses the setting configured in the Rewrite
    profile. If the Client Cache option is configured for any other
    setting, the web application resource item caching
    configuration overwrites the setting in the Rewrite profile.
    The default is cache-css-js. The options are:

    cache-all
        Do not modify cache headers on backend servers.

    cache-css-js
        Cache only the CSS file and Java Script.

    cache-img-css-js
        Cache only images, the CSS file and Java Script.

    no-cache
        Eliminate caching.

defaults-from
    Specifies the profile from which the Rewrite profile inherits
    properties. Explicitly specified properties override inherited
    properties.

java-ca-file
    Specifies a CA against which to verify signed Java applets
    signatures. The default value is ca-bundle.crt.

java-crl
    Specifies a CRL against which to verify signed Java applets
    signature certificates. The default value is none.

```

#### java-sign-key

Specifies a private key for re-signing of signed Java applets after patching. The default value is default.key.

#### java-sign-key-passphrase

Specifies a passphrase for the private key to be encrypted with. The default value is none. Note: your passphrase will be encrypted and displayed under the label java-sign-key-passphrase-encrypted.

#### java-signer

Specifies a certificate to use for re-signing of signed Java applets after patching. The default value is default.crt.

#### location-specific

Specifies whether or not this object contains one or more attributes with values that are specific to the location where the BIG-IP device resides. The location-specific attribute is either true or false. When using policy sync, mark an object as location-specific to prevent errors that can occur when policies reference objects, such as authentication servers, that are specific to a certain location. The default value is none.

#### rewrite-list

Specifies a list of URIs that are rewritten inside a web page when the page is accessed using Portal Access. The default value is none.

#### rewrite-mode

Specifies the mode of rewriting. uri-translation is a rules-based rewrite mode. portal is for use with Portal Access.

#### set-cookie-rules

Used with uri-translation mode. Specifies the rules for rewriting HTTP Set-Cookie headers. Each rule has a name and a client and server domain and path. The name may be any alphanumeric string and must be unique. The path must be an absolute directory path and not a relative path or a file path. If the domain and path of the Set-Cookie header in the HTTP response match the domain and path of the server side of a rule, they will be rewritten to the domain and path of client side of that rule. Set-Cookie rules take precedence over URI rules when rewriting Set-Cookie headers.

#### split-tunneling

Specifies whether the profile provides for split tunneling. The default is false.

#### uri-rules

Used with uri-translation mode. Specifies the rules for rewriting request and response headers and response bodies. These rules affect the following.

#### request headers

URI, Host, Referer

#### response headers

Content-Location, Link, Location, Refresh, Set-Cookie

#### response body

HTML, CSS

Each rule has a name, a type, and a client and server URI. The name may be any alphanumeric string and must be unique. The type may be "request", "response", or "both": "request" rules affect request headers only, "response" rules affect response headers and bodies only, and "both" rules affect both. URIs must include a path; scheme, host, and port are optional. If a URI must contain a scheme or host, it must include both. If it must include a port, it must also include a scheme and host. Paths may be absolute directory paths only. They may not be relative paths or file paths. If a URI in a request header matches the client side URI of a rule, it will be rewritten to the server side URI of that rule. If a URI in a response header or body matches the server side URI of a rule, it will be rewritten to the client side URI of that rule. When rewriting Set-Cookie headers, the host and path of the server side URI are used to match the domain and path of the header. The client side host and path replace that header's domain and path if a match is found. Set-Cookie rules take precedence over URI rules when rewriting Set-Cookie headers.

# ltm profile rtsp

**NAME**  
rtsp - Configures an RTSP (realtime streaming protocol) profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the rtsp component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create rtsp [name]  
modify rtsp [name]  
options:  
  app-service [[string] | none]  
  check-source [disabled | enabled]  
  defaults-from [name]  
  description [string]  
  idle-timeout [integer]  
  max-header-size [integer]  
  max-queued-data [integer]  
  multicast-redirect [disabled | enabled]  
  proxy [external | internal | none]  
  proxy-header [ [name] | none]  
  real-http-persistence [disabled | enabled]  
  rtcp-port [number]  
  rtp-port [number]  
  session-reconnect [disabled | enabled]  
  unicast-redirect [disabled | enabled]  
  log-publisher [log publisher name | none]  
  log-profile [log profile name | none]

edit rtsp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

mv rtsp [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]] ]  
options:  
  to-folder

reset-stats rtsp  
reset-stats rtsp [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
list rtsp  
list rtsp [ [ [name] | [glob] | [regex] ] ... ]  
show running-config rtsp  
show running-config rtsp  
  [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
  partition

show rtsp  
show rtsp [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
  field-fmt  
  global

**DELETE**  
delete rtsp [name]

**DESCRIPTION**  
You can use the rtsp component to manage a profile that you use to control RTSP traffic.

**EXAMPLES**  
create rtsp my\_rtsp\_profile defaults-from rtsp  
  
Creates a custom RTSP profile named my\_rtsp\_profile that inherits its settings from the system default RTSP profile.  
  
list rtsp all-properties  
  
Displays all properties for all RTSP profiles.  
  
mv rtsp /Common/my\_rtsp\_profile to-folder /Common/my\_folder  
  
Moves a custom rtsp profile named my\_rtsp\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.  
  
check-source  
When enabled the system uses the source attribute in the transport header to establish the target address of the RTP stream, and before the response is forwarded to the client, updates the value of the source attribute to be the virtual address of the BIG-IP

system. When disabled the system does not change the source attribute. The default value is enabled.

#### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all of the settings and values from the specified parent profile. The default value is rtsp.

#### description

User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### idle-timeout

Specifies the number of seconds that a connection is idle before the connection is eligible for deletion. The default value is 300 seconds.

#### max-header-size

Specifies the maximum size of an RTSP request or response header that the RTSP filter accepts before dropping the connection. The default value is 4096 bytes.

#### max-queued-data

Specifies the maximum amount of data that the RTSP filter buffers before dropping the connection. The default value is 32768 bytes.

#### multicast-redirect

Specifies whether to enable or disable multicast redirect. When enabled, the client can select the destination to which to stream data. The default value is disabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### partition

Displays the administrative partition within which the component resides.

#### proxy

Specifies whether the RTSP filter is associated with an RTSP proxy configuration. The default value is none.

#### proxy-header

When the proxy option is set, specifies the name of the header in the RTSP proxy configuration that is passed from the client-side virtual server to the server-side virtual server. Note that the name of the header must begin with X-. The default value is none.

To use the proxy-header option, you must specify a value for the proxy option.

#### real-http-persistence

Specifies whether to enable or disable real HTTP persistence. When enabled, the RTSP filter automatically persists Real Networks RTSP over HTTP using the RTSP port. The default value is enabled. If you disable this parameter, you can override the default behavior with an iRule.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### rtcp-port

Specifies the number of the port to use for the Real Time Control Protocol (RTCP) service. The default value is 0 (zero). RTCP allows monitoring of real-time data delivery.

#### rtp-port

Specifies the number of the port to use for the RTP service. The default value is 0 (zero).

#### session-reconnect

Specifies whether to enable or disable session reconnect. When enabled, the RTSP filter persists the control connection, which is being resumed, to the correct server. The default value is disabled.

#### to-folder

rtsp profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

#### unicast-redirect

Specifies whether to enable or disable unicast redirect. When enabled, the client can select the destination to which to stream data. The default value is disabled.

#### log-publisher

Specify the name of the log publisher which logs translation events. See help sys log-config for more details on the logging sub-system. Use the "sys log-config publisher" component to set up a log publisher.

#### log-profile

Specify the name of the ALG log profile which controls the logging of ALG. See help ltm alg-log-profile for more details on the logging profile sub-system. Use the "ltm alg-log-profile profile" component to set up a ALG log profile.

#### DELETE

delete sctp [name]

## DESCRIPTION

You can use the sctp component to manage a profile for SCTP traffic.

## EXAMPLES

```
create sctp my_sctp_profile defaults-from sctp
```

Creates a custom SCTP profile named my\_sctp\_profile that inherits its settings from the system default SCTP profile.

```
list sctp all-properties
```

Displays all properties for all SCTP profiles.

```
mv sctp /Common/my_sctp_profile to-folder /Common/my_folder
```

Moves a custom sctp profile named my\_sctp\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

## OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

cookie-expiration

Specifies how many seconds the cookie is valid. The default value is 60 seconds.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is sctp.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

heartbeat-interval

Specifies the number of seconds to wait before sending a heartbeat chunk. The default value is 30 seconds.

heartbeat-max-burst

Specifies the number of heartbeat packets to be sent in a single burst. The default value is 1.

idle-timeout

Specifies the number of seconds without traffic before a connection is eligible for deletion. The default value is 300 seconds.

in-streams

Specifies the number of inbound streams. The default value is 2.

init-max-retries

Specifies the maximum number of retries to establish a connection. The default value is 4.

ip-tos

Specifies the Type of Service (ToS) that is set in packets sent to the peer. The default value is 0.

link-qos

Specifies the Link Quality of Service (QoS) that is set in sent packets. The default value is 0.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

out-streams

Specifies the number of outbound streams. The default value is 2.

partition

Displays the administrative partition within which the component resides.

proxy-buffer-high

Specifies the proxy buffer level after which the system closes the receive window. The default value is 16384.

proxy-buffer-low

Specifies the proxy buffer level after which the system opens the receive window. The default value is 4096.

receive-chunks

Specifies the size (in chunks) of the rx\_chunk buffer. The default value is 256.

receive-ordered

When enabled, the default, the system delivers messages to the application layer in order.

receive-window-size

Specifies the size (in bytes) of the receive window. Prorate this value to the receive-chunks value. The default value is 65535.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression])

to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**reset-on-timeout**

When enabled, the default, the system resets the connection when the connection times out.

**secret**

Specifies the internal secret string used for HTTP Message Authenticated Code (HMAC) cookies.

**send-buffer-size**

Specifies the size in bytes of the buffer. The default value is 65536.

**max-burst**

Specifies the maximum number of data packets to send in a single burst. The default value is 4.

**send-max-retries**

Specifies the maximum number of time the system tries again to send the data. The default value is 8.

**send-partial**

When enabled, the default, the system accepts partial application data.

**tcp-shutdown**

When enabled, the system emulates the closing of a TCP connection. The default value is enabled.

**to-folder**

sctp profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**transmit-chunks**

Specifies the size of the tx\_chunk buffer. The default value is 256.

## ltm profile server-ldap

NAME

server-ldap - Configures an Server LDAP profile.

MODULE

ltm profile

SYNTAX

Configure the server-ldap component within the ltm profile module using the syntax shown in the following sections.

CREATE/MODIFY

```
create server-ldap [name]
modify server-ldap [name]
```

options:

```
app-service [[string] | none]
defaults-from [ [name] | none]
description [string]
activation-mode [ none | allow | require ]
ss-activation-mode [ none | allow | require ]
```

```
edit server-ldap [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

```
list server-ldap
list server-ldap [ [ [name] | [glob] | [regex] ] ... ]
show running-config server-ldap
show running-config server-ldap [ [ [name] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

**DELETE**  
delete server-ldap [name]

**DESCRIPTION**  
You can use the server-ldap component to create, modify, display, or delete an Server LDAP profile with which you can manage Server LDAP traffic.

**EXAMPLES**  
create server-ldap my\_serverldap\_profile defaults-from serverldap  
Creates a custom Server LDAP profile named my\_serverldap\_profile that inherits its settings from the system default Server LDAP profile.  
list server-ldap  
Displays the properties of all Server LDAP profiles.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.  
defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is smtp.  
description  
User defined description.  
glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.  
name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.  
regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.  
activation-mode  
Sets the activation-mode for STARTTLS. The options are NONE, ALLOW, or REQUIRE. The default value is NONE.

**SEE ALSO**  
create, delete, edit, glob, list, ltm virtual, modify, regex, reset-stats, show, sys provision, tmsh

```

#### DESCRIPTION

You can use the server-ssl component to manage a server SSL profile.

Server-side profiles enable the traffic management system to handle encryption tasks for any SSL connection being sent from a local traffic management system to a target server. A server-side SSL profile is acts as a client by presenting certificate credentials to a server when authentication of the local traffic management system is required. You implement this type of profile by using the default profile, or by creating a custom profile based on the Server SSL profile template and modifying its settings.

#### EXAMPLES

```
create server-ssl my_serverssl_profile defaults-from serverssl
```

Creates a custom Server SSL profile named my\_serverssl\_profile that inherits its settings from the system default profile serverssl.

list server-ssl all-properties

Displays all properties for all Server SSL profiles.

mv server-ssl /Common/my\_serverssl\_profile to-folder /Common/my\_folder

Moves a custom server-ssl profile named my\_serverssl\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

alert-timeout

Specifies the maximum time period in seconds to keep the SSL session active after alert message is sent, or indefinite. The default value is indefinite.

authenticate

Specifies the frequency of authentication. The default value is once.

authenticate-depth

Specifies the client certificate chain maximum traversal depth. The default value is 9.

authenticate-name

Specifies a Common Name (CN) that is embedded in a server certificate. The system authenticates a server based on the specified CN. The default value is none.

bypass-on-client-cert-fail

Enables or disables SSL forward proxy bypass on failing to get client certificate that server asks for. When enabled and the SSL handshake cannot be completed because of failure to get the client certificate, SSL traffic bypasses the BIG-IP system untouched, without decryption/encryption. The default value is disabled. Conversely, you can specify enabled to use this feature.

bypass-on-handshake-alert

Enables or disables SSL forward proxy bypass on receiving handshake failure, protocol version or unsupported extension alert message during the serverside SSL handshake. When enabled and there is an SSL handshake failure, protocol version or unsupported extension alert during the serverside SSL handshake, SSL traffic bypasses the BIG-IP system untouched, without decryption/encryption. The default value is disabled. Conversely, you can specify enabled to use this feature.

ca-file

Specifies the certificate authority file name. Configures certificate verification by specifying a list of client or server CAs that the traffic management system trusts. The default value is none.

cache-size

Specifies the SSL session cache size. For client profiles only, you can configure timeout and size values for the SSL session cache. Because each profile maintains a separate SSL session cache, you can configure the values on a per-profile basis. The default value is 262144.

cache-timeout

Specifies the SSL session cache timeout value, which is the usable lifetime seconds of negotiated SSL session IDs. The default value is 3600 seconds. Acceptable values are integers greater than or equal to 0 and less than or equal to 86400.

cert Specifies the name of the certificate installed on the traffic management system for the purpose of terminating or initiating an SSL connection. The default value is none.

chain

Specifies or builds a certificate chain file that a client can use to authenticate the profile. The default value is none.

cipher-group

Specifies a cipher group. If the cipher group is not blank or none, the ciphers string will be used.

ciphers

Specifies a cipher name. The default value is DEFAULT.

crl-file

Specifies the certificate revocation list file name. The default value is none.

allow-expired-crl

Use the specified CRL file even if it has expired. The default value is disabled.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is serverssl.

description

User defined description.

#### expire-cert-response-control

Specifies the BIGIP action when the server certificate has expired. The default value is drop, which causes the connection to be dropped. Conversely, you can specify ignore to cause the connection to ignore the error and continue.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### handshake-timeout

Specifies the handshake timeout in seconds. The default value is 10.

**key** Specifies the key file name. Specifies the name of the key installed on the traffic management system for the purpose of terminating or initiating an SSL connection. The default value is none.

#### mod-ssl-methods

Enables or disables ModSSL methods. The default value is disabled.

Enable this option when OpenSSL methods are inadequate. For example, you can enable ModSSL method emulation when you want to use SSL compression over TLSv1.

**mode** Enables or disables SSL processing. The default value is enabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### options

Enables options, including some industry-related workarounds. Enter options inside braces, for example, { dont-insert-empty-fragments microsoft-sess-id-bug}. The default value is dont-insert-empty-fragments.

#### all-bugfixes

This option enables the following industry-related defect workarounds: microsoft-sess-id-bug, netscape-challenge-bug, netscape-reuse-cipher-change-bug, sslref2-reuse-cert-type-bug, microsoft-big-ssl3-buffer, msie-ssl2-rsa-padding, ssleay-080-client-dh-bug, tls-d5-bug, tls-block-padding-bug, and dont-insert-empty-fragments.

It is usually safe to use this option to enable the defect workaround options when compatibility with broken implementations is desired. Note that if you edit the configuration in the browser-based Configuration utility, the system expands the all-bugfixes syntax into each individual option.

#### cipher-server-preference

When choosing a cipher, this option uses the server's preferences instead of the client references. When this option is not set, the SSL server always follows the client's references. When this option is set, the SSLv3/TLSv1 server chooses by using its own references. Due to the different protocol, for SSLv2 the server sends its list of preferences to the client and the client always chooses.

#### dont-insert-empty-fragments

Disables a countermeasure against a SSL 3.0/TLS 1.0 protocol vulnerability affecting CBC ciphers. These ciphers cannot be handled by certain broken SSL implementations. This option has no effect for connections using other ciphers.

#### ephemeral-rsa

Uses ephemeral (temporary) RSA keys when doing RSA operations. According to the specifications, this is only done when an RSA key can be used for signature operations (namely under export ciphers with restricted RSA key length). By setting this option, you specify that you always want to use ephemeral RSA keys. This option breaks compatibility with the SSL/TLS specifications and may lead to interoperability problems with clients. Therefore, F5 Networks does not recommend this option. Use ciphers with EDH (ephemeral Diffie-Hellman) key exchange instead. This option is ignored for server-side SSL.

#### max-active-handshakes

Specifies the maximum number allowed SSL active handshakes. The default value is 0.

#### microsoft-big-ssl3-buffer

Enables a workaround for communicating with older Microsoft(r) applications that use non-standard SSL record sizes.

#### microsoft-sess-id-bug

Handles a Microsoft session ID problem.

#### msie-ssl2-rsa-padding

Enables a workaround for communicating with older Microsoft applications that use non-standard RSA key padding. This option is ignored for server-side SSL.

#### netscape-ca-dn-bug

Handles a defect regarding the system crashing or hanging. If the system accepts a Netscape Navigator(r) browser connection, demands a client cert, has a non-self-signed CA that does not have its CA in Netscape, and the browser has a certificate, the system crashes or hangs.

#### netscape-challenge-bug

Handles the Netscape challenge problem.

`netscape-demo-cipher-change-bug`  
Manipulates the SSL server session resumption behavior to mimic that of certain Netscape servers (see the Netscape reuse cipher change bug workaround description). Note that F5 Networks does not recommend this option for normal use. It is ignored for server-side SSL.

`netscape-reuse-cipher-change-bug`  
Handles a defect within Netscape-Enterprise/2.01 (<https://merchant.neape.com>), appearing only when connecting through SSLv2/v3, and then reconnecting through SSLv3. In this case, the cipher list changes.

First, a connection is established with the RC4-MD5 cipher list. If it is then resumed, the connection switches to using the DES-CBC3-SHA cipher list. However, according to RFC 2246, (section 7.4.1.3, cipher suite) the cipher list is RC4-MD5.

As a workaround, you can attempt to connect with a cipher list of DES-CBC-SHA:RC4-MD5 and so on. For some reason, each new connection uses the RC4-MD5 cipher list, but any re-connection attempts to use the DES-CBC-SHA cipher list. Thus Netscape, when reconnecting, always uses the first cipher in the cipher list.

`no-session-resumption-on-renegotiation`  
When performing renegotiation as an SSL server, this option always starts a new session (that is, session resumption requests are accepted only in the initial handshake). The system ignores this option for server-side SSL.

`no-ssl`  
Do not use any version of the SSL protocol.

`no-ssl2`  
Do not use the SSLv2 protocol.

`no-ssl3`  
Do not use the SSLv3 protocol.

`no-tls`  
Do not use any version of the TLS protocol.

`no-tls1`  
Do not use the TLSv1.0 protocol.

`no-tls1.1`  
Do not use the TLSv1.1 protocol.

`no-tls1.2`  
Do not use the TLSv1.2 protocol.

`no-dtls`  
Do not use any version of the DTLS protocol.

`passive-close`  
Specifies how to handle passive closes.

`none` Disables all workarounds. Note that F5 Networks does not recommend this option.

`pkcs1-check-1`  
This debugging option deliberately manipulates the PKCS1 padding used by SSL clients in an attempt to detect vulnerability to particular SSL server vulnerabilities. Note that F5 Networks does not recommend this option for normal use. The system ignores this option for client-side SSL.

`pkcs1-check-2`  
This debugging option deliberately manipulates the PKCS1 padding used by SSL clients in an attempt to detect vulnerability to particular SSL server vulnerabilities. Note that F5 Networks does not recommend this option for normal use. The system ignores this option for client-side SSL.

`single-dh-use`  
Creates a new key when using temporary/ephemeral DH parameters. This option must be used to prevent small subgroup attacks, when the DH parameters were not generated using strong primes (for example, when using DSA-parameters). If strong primes were used, it is not strictly necessary to generate a new DH key during each handshake, but F5 Networks recommends it. Enable the Single DH Use option whenever temporary or ephemeral DH parameters are used.

`ssleay-080-client-dh-bug`  
Enables a workaround for communicating with older SSLeay-based applications that specify an incorrect Diffie-Hellman public value length. This option is ignored for server-side SSL.

`sslref2-reuse-cert-type-bug`  
Handles the SSL reuse certificate type problem.

`tls-block-padding-bug`  
Enables a workaround for communicating with older TLSv1-enabled applications that use incorrect block padding.

`tls-d5-bug`  
This option is a workaround for communicating with older TLSv1-enabled applications that specify an incorrect encrypted RSA key length. This option is ignored for server-

side SSL.

**tls-rollback-bug**  
Disables version rollback attack detection. During the client key exchange, the client must send the same information about acceptable SSL/TLS protocol levels as it sends during the first hello. Some clients violate this rule by adapting to the server's answer. For example, the client sends an SSLv2 hello and accepts up to SSLv3.1 (TLSv1), but the server only processes up to SSLv3. In this case, the client must still use the same SSLv3.1 (TLSv1) announcement. Some clients step down to SSLv3 with respect to the server's answer and violate the version rollback protection. The system ignores this option for server-side SSL.

**partition**  
Displays the administrative partition within which the component resides.

**passphrase**  
Specifies the key passphrase, if required. The default value is none.

**peer-cert-mode**  
Specifies the peer certificate mode. The default value is ignore.

**proxy-ssl**  
Enabling this option requires a corresponding client ssl profile with proxy-ssl enabled to perform transparent SSL decryption. This feature allows further modification of application traffic within an SSL tunnel while still allowing the server to perform necessary authorization, authentication, auditing steps.

**proxy-ssl-passthrough**  
Enabling this option requires a corresponding client ssl profile with proxy-ssl-passthrough enabled. This allows Proxy SSL to passthrough the traffic when ciphersuite negotiated between the client and server is not supported. The default option is disabled.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**renegotiate-period**  
Specifies the number of seconds from the initial connect time after which the system renegotiates an SSL session. The default value is indefinite, which means that you do not want the system to renegotiate SSL sessions.

Each time the session renegotiation is successful, a new connection is started. Therefore, the system attempts to renegotiate the session again, in the specified amount of time following a successful session renegotiation. For example, setting the renegotiate-period option to 3600 seconds triggers session renegotiation at least once an hour.

**renegotiate-size**  
Specifies a throughput size, in megabytes, of SSL renegotiation. This option forces the traffic management system to renegotiate an SSL session based on the size, in megabytes, of application data that is transmitted over the secure channel. The default value is indefinite, which specifies that you do not want a throughput size.

**renegotiation**  
Specifies whether renegotiations are enabled. The default value is enabled. When renegotiations are disabled, the system is acting as an SSL server, and a COMPAT or NATIVE cipher is negotiated, the system will abort the connection. Additionally, when renegotiations are disabled and the system is acting as an SSL client, the system will ignore the server's HelloRequest messages.

**retain-certificate**  
APM module requires storing certificate in SSL session. When set to false, certificate will not be stored in SSL session. The default value is true.

**generic-alert**  
Enables or disables generic-alert. The default option is enabled, which causes the SSL profile to use generic alert number. Conversely, you can specify disabled to cause SSL profile to use alert number defined in RFC5246/RFC6066 strictly.

**secure-renegotiation**  
Specifies the secure renegotiation mode. The default value is require-strict. When secure renegotiation is set to require, any connection to an unpatched server will be aborted. For server-ssl, there is no difference between require and require-strict secure renegotiation. When secure renegotiation is set to request, connections to unpatched servers will be permitted. This setting is NOT recommended however, as it is subject to active man-in-the-middle attacks.

**server-name**  
Specifies the server name to be included in SNI (server name indication) extension during SSL handshake in ClientHello.

**session-mirroring**  
Enables or disables the mirroring of sessions to high availability peer. By default, this setting is disabled, which causes the system to not mirror ssl sessions.

**session-ticket**  
Enables or disables session-ticket. The default option is disabled, which causes the SSL profile not to use session ticket per RFC 5077. Conversely, you can specify enabled to cause SSL profile to use session ticket per RFC 5077.

**sni-default**  
When true, this profile is the default SSL profile when the server name in a client connection does not match any configured server names, or a client connection does not specify any server name at all.

**sni-require**  
When this option is enabled, connections to a server that does not support SNI extension will be rejected.

**ssl-forward-proxy**  
Enables or disables ssl-forward-proxy feature. The default option is disabled. Conversely, you can specify enabled to use the SSL Forward Proxy Feature.

**ssl-sign-hash**  
Specifies SSL sign hash algorithm which is used to sign and verify SSL Server Key Exchange and Certificate Verify messages for the specified SSL profiles. The default value is sha1.

**ssl-forward-proxy-bypass**  
Enables or disables ssl-forward-proxy-bypass feature. The default option is disabled. Conversely, you can specify enabled to use the SSL Forward Proxy Bypass Feature.

**strict-resume**  
Enables or disables the resumption of SSL sessions after an unclean shutdown. The default value is disabled, which indicates that the SSL profile refuses to resume SSL sessions after an unclean shutdown.

**to-folder**  
server-ssl profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

**unclean-shutdown**  
Specifies, when enabled, that the SSL profile performs unclean shutdowns of all SSL connections, which means that underlying TCP connections are closed without exchanging the required SSL shutdown alerts. If you want to force the SSL profile to perform a clean shutdown of all SSL connections, you can disable this option.

**untrusted-cert-response-control**  
Specifies the BIGIP action when the server certificate has untrusted CA. The default value is drop, which causes the connection to be dropped. Conversely, you can specify ignore to cause the connection to ignore the error and continue.

## ltm profile sip

**NAME**  
sip - Configures a Session Initiation Protocol (SIP) profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the sip component within the ltm profile module using the syntax shown in the following sections.

```

CREATE/MODIFY
create sip [name]
modify sip [name]
options:
  alg-enable [disabled | enabled]
  app-service [[string] | none]
  community [ [community name] | none]
  defaults-from [ [name] | none]
  description [string]
  dialog-aware [disabled | enabled]
  dialog-establishment-timeout [integer]
  enable-sip-firewall [no | yes]
  insert-record-route-header [disabled | enabled]
  insert-via-header [disabled | enabled]
  max-media-sessions [integer]
  max-registrations [integer]
  max-sessions-per-registration [integer]
  max-size [integer]
  registration-timeout [integer]
  rtp-proxy-style [symmetric | restricted-by-ip-address | any-location]
  secure-via-header [disabled | enabled]
  security [disabled | enabled]
  sip-session-timeout [integer]
  terminate-on-bye [disabled | enabled]
  user-via-header [ [via-header] | none]
  log-publisher [log publisher name | none]
  log-profile [log profile name | none]

edit sip [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

mv sip [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]
options:
  to-folder

reset-stats sip
reset-stats sip [ [ [name] | [glob] | [regex] ] ... ]

DISPLAY
list sip
list sip [ [ [name] | [glob] | [regex] ] ... ]
show running-config sip
show running-config sip [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show sip
show sip [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt

DELETE
delete sip [name]

```

#### DESCRIPTION

You can use the sip component to manage a SIP profile.

#### EXAMPLES

```

create sip my_sip_profile defaults-from sip

Creates a SIP profile named my_sip_profile using the system defaults.

create sip my_sip_profile { terminate-bye disabled }

Creates a SIP profile named my_sip_profile that leaves a connection
open following the completion of a BYE transaction.

mv sip /Common/my_sip_profile to-folder /Common/my_folder

Moves a custom sip profile named my_sip_profile to a folder named
my_folder, where my_folder has already been created and exists within
/Common.

```

#### OPTIONS

**alg-enable**  
Enables or disables the SIP ALG (Application Level Gateway) feature. The default value is disabled. Note: for a SIP profile with ALG enabled to function correctly, the virtual which uses the profile must have destination and mask set to 0.0.0.0 for IPv4, or :: for IPv6. Additionally, the virtual must have source-address-translation enabled.

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**community**  
Specifies the community to which you want to assign the virtual server that you associate with this profile. The default value is none.

**defaults-from**  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all of the settings and values from the

specified parent profile. The default value is sip.

**description**  
User defined description.

**dialog-aware**  
Enables or disables the ability for the system to be aware of unauthorized use of the SIP dialog. The default value is disabled.

**dialog-establishment-timeout**  
Indicates the timeout value for dialog establishment in a sip session. The default value is 10 seconds.

**enable-sip-firewall**  
Indicates whether to enable SIP firewall functionality or not. Default value is no.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**insert-record-route-header**  
Enables or disables the insertion of a Record-Route header, which indicates the next hop for the following SIP request messages. The default value is disabled.

**insert-via-header**  
Enables or disables the insertion of a Via header, which indicates where the message originated. The response message uses this routing information. The default value is disabled.

**max-media-sessions**  
Indicates the maximum number of SDP media sessions that the BIG-IP system accepts. The default value is 6.

**max-registrations**  
Indicates the maximum number of registrations, the maximum allowable REGISTER messages can be recorded that the BIG-IP system accepts. The default value is 100.

**max-sessions-per-registration**  
Indicates the maximum number of calls or sessions can be made by a user for a single registration that the BIG-IP system accepts. The default value is 50.

**max-size**  
Specifies the maximum SIP message size that the BIG-IP system accepts. The default value is 65535 bytes.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**registration-timeout**  
Indicates the timeout value for a sip registration. The default value is 3600 seconds.

**rtp-proxy-style**  
Indicates the style in which the RTP will proxy the data. When a dialog is established, the necessary SDP data needs to know where the RTP flows are directed. The default value is symmetric. The options available are:

**symmetric**  
Indicates the use of a bidirectional related flow.

**restricted-by-ip-address**  
Indicates the use of ephemeral listeners to support fixed client IP, listener is restricted to connections coming from a particular source.

**any-location**  
Indicates the use of ephemeral listeners to support wildcard, connections are allowed to come from anyway.

**secure-via-header**  
Enables or disables the insertion of a Secure Via header, which indicates where the message originated. When you are using SSL/TLS (over TCP) to create a secure channel with the server node, use this setting to configure the system to insert a Secure Via header into SIP requests. The default value is disabled.

**security**  
Enables or disables security for the SIP profile. The default value is disabled.

**sip-session-timeout**  
Indicates the timeout value for a sip session. The default value is 300 seconds.

**terminate-on-bye**  
Enables or disables the termination of a connection when a BYE transaction finishes. Use this parameter with UDP connections only, not with TCP connections. The default value is enabled.

**to-folder**

sip profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

#### user-via-header

Enables or disables the insertion of a Via header specified by a system administrator. The default value is none.

#### log-publisher

Specify the name of the log publisher which logs translation events. See help sys log-config for more details on the logging sub-system. Use the "sys log-config publisher" component to set up a log publisher.

#### log-profile

Specify the name of the ALG log profile which controls the logging of ALG . See help ltm alg-log-profile for more details on the logging profile sub-system. Use the "ltm alg-log-profile profile" component to set up a ALG log profile.

## ltm profile smtp

#### NAME

smtp - Configures an SMTP profile.

#### MODULE

ltm profile

#### SYNTAX

Configure the smtp component within the ltm profile module using the syntax shown in the following sections. The smtp profile is available when the asm module is enabled. You enable the asm module via provisioning commands, which are described in help sys provision.

#### CREATE/MODIFY

```
create smtp [name]
```

```
modify smtp [name]
```

#### options:

```
app-service [[string] | none]
```

```
defaults-from [ [name] | none]
```

```
description [string]
```

```
security [disabled | enabled]
```

```
edit smtp [ [ [name] | [glob] | [regex] ] ... ]
```

#### options:

```
all-properties
```

```
non-default-properties
```

#### DISPLAY

```
list smtp
```

```
list smtp [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config smtp
```

```
show running-config smtp [ [ [name] | [glob] | [regex] ] ... ]
```

#### options:

```
all-properties
```

```
non-default-properties
```

#### DELETE

```
delete smtp [name]
```

#### DESCRIPTION

You can use the smtp component to create, modify, display, or delete an SMTP profile with which you can manage SMTP traffic.

#### EXAMPLES

```
create smtp my_smtp_profile defaults-from smtp
```

Creates a custom SMTP profile named my\_smtp\_profile that inherits its settings from the system default SMTP profile.

```
list smtp
```

Displays the properties of all SMTP profiles.

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

**defaults-from**  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is smtp.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**security**  
Enables or disables secure SMTP traffic for the BIG-IP(r) Application Security Manager. The default value is disabled.

#### SEE ALSO

create, delete, edit, glob, list, ltm virtual, modify, regex, reset-stats, show, sys provision, tmsh

## ltm profile smtps

**NAME**  
smtps - Configures an SMTPs profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the smtps component within the ltm profile module using the syntax shown in the following sections. The smtps profile is available when the asm module is enabled. You enable the asm module via provisioning commands, which are described in help sys provision.

**CREATE/MODIFY**  
create smtps [name]  
modify smtps [name]  
options:  
app-service [[string] | none]  
defaults-from [ [name] | none]  
description [string]  
activation-mode [ none | allow | require ]

edit smtps [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list smtps  
list smtps [ [ [name] | [glob] | [regex] ] ... ]  
show running-config smtps  
show running-config smtps [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DELETE**  
delete smtps [name]

**DESCRIPTION**  
You can use the smtps component to create, modify, display, or delete an SMTPs profile with which you can manage SMTPs traffic.

#### EXAMPLES

```
create smtps my_smtps_profile defaults-from smtps
```

Creates a custom SMTPs profile named `my_smtps_profile` that inherits its settings from the system default SMTPs profile.

```
list smtps
```

Displays the properties of all SMTPs profiles.

#### OPTIONS

`app-service`

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

`defaults-from`

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is `smtp`.

`description`

User defined description.

`glob` Displays the items that match the glob expression. See `help glob` for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

`activation-mode`

Sets the activation-mode for STARTTLS. The options are `NONE`, `ALLOW`, or `REQUIRE`. The default value is `NONE`.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm virtual`, `modify`, `regex`, `reset-stats`, `show`, `sys provision`, `tmsh`

#### COPYRIGHT

## ltm profile socks

#### NAME

`socks` - Configures a SOCKS profile.

#### MODULE

`ltm profile`

#### SYNTAX

Configure the `socks` component within the `ltm profile` module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create socks [name]
```

```
modify socks [name]
```

##### options:

```
protocol-versions {  
  [ socks4 ] | [ socks4a ] | [ socks5 ] ... }  
}
```

```
dns-resolver [dns-resolver]
```

```
tunnel-name [tunnel]
```

```
route-domain [route-domain]
```

```
default-connect-handling [deny | allow]
```

```
edit socks [ [ name ] | [ glob ] | [ regex ] ... ]
```

##### options:

```
all-properties
```

```
non-default-properties
```

```
reset-stats socks
```

```
reset-stats socks [ [ name ] | [ glob ] | [ regex ] ... ]
```

##### DISPLAY

```
list socks
```

```
list socks [ [ name ] | [ glob ] | [ regex ] ... ]
```

```
show running-config socks
show running-config socks [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

show socks
show socks [ [ [name] | [glob] | [regex] ] ... ]
  options:
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    field-fmt
    global

DELETE
delete socks [name]
```

#### DESCRIPTION

You can use the socks component to create, modify, display, or delete an SOCKS profile.

The BIG-IP(r) system installation includes the following default SOCKS-type profiles:

socks

The default SOCKS profile contains values for properties related to managing SOCKS traffic.

You can create a new SOCKS-type profile using an existing profile as a parent profile, and then you can change the values of the properties to suit your needs.

#### EXAMPLES

```
create socks my_socks_profile defaults-from socks
```

Creates a custom SOCKS profile named `my_socks_profile` that inherits its settings from the system default SOCKS profile.

#### OPTIONS

protocols-versions

Specifies the SOCKS protocol versions that are supported. The value is one or more off:

socks4

Specifies protocol support for SOCKS version 4.

socks4a

Specifies protocol support for SOCKS version 4A (like version 4, but with hostname support).

socks5

Specifies protocol support for SOCKS version 5 (with hostname and IPv6 support).

The default value specifies all available protocols.

dns-resolver

Specifies the dns-resolver object that will be used to resolve hostnames in connect requests. The default is dns-resolver.

tunnel-name

Specifies the tunnel that will be used for outbound connect requests. This enables other virtual servers to receive connections initiated by the proxy service. The default is socks-tunnel.

route-domain

Specifies the route-domain that will be used for outbound connect requests. The default is 0.

default-connect-handling

Specifies the behavior of the proxy service for connect requests. If set to deny, connect requests will only be honored if there is another virtual server listening for the requested outbound connection. If set to allow outbound connections will be made regardless of other virtual servers. The default is deny.

# ltm profile splitsessionclient

**NAME**  
splitsessionclient - Configures a Splitsessionclient profile.

**MODULE**  
splitsessionclient profile

**SYNTAX**  
Configure the splitsessionclient component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create splitsessionclient [name]  
modify splitsessionclient [name]  
options:  
peer-ip  
peer-port

**DISPLAY**  
list splitsessionclient  
list splitsessionclient [ [name] | [glob] | [regex] ] ... ]  
show running-config splitsessionclient  
show running-config splitsessionclient [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

show splitsessionclient  
show splitsessionclient [ [name] | [glob] | [regex] ] ... ]  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
field-fmt  
global

**DELETE**  
delete splitsessionclient [name]

**DESCRIPTION**  
Use this command to create, modify, display, or delete a Splitsessionclient profile.

**EXAMPLES**  
create splitsessionclient my\_splitsessionclient\_profile defaults-from splitsessionclient

**OPTIONS**

peer-ip  
Specifies the IP address of the Splitsession peer that the Out-of-band connection is made to. There is no default value for this field. splitsession-default-serverssl and splitsession-default-tcp profiles are used by the Splitsession client for the encrypted Out-of-band channel.

peer-port  
Specifies the port of the Splitsession peer that the Out-of-band connection is made to. There is no default value for this field. splitsession-default-serverssl and splitsession-default-tcp profiles are used by the Splitsession client for the encrypted Out-of-band channel.

defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is none.

description  
User defined description.

glob  
Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name  
Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**  
create, delete, edit, glob, list, ltm profile fasthttp, ltm virtual, modify, regex, reset-stats, show, tmsh

## ltm profile splitsessionserver

**NAME**  
splitsessionserver - Configures a Splitsessionserver profile.

**MODULE**  
splitsessionserver profile

**SYNTAX**  
Configure the splitsessionserver component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create splitsessionserver [name]  
modify splitsessionserver [name]  
options:  
listen-ip  
listen-port

**DISPLAY**  
list splitsessionserver  
list splitsessionserver [ [name] | [glob] | [regex] ] ... ]  
show running-config splitsessionserver  
show running-config splitsessionserver [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

show splitsessionserver  
show splitsessionserver [ [name] | [glob] | [regex] ] ... ]  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
field-fmt  
global

**DELETE**  
delete splitsessionserver [name]

**DESCRIPTION**  
Use this command to create, modify, display, or delete a Splitsessionserver profile.

**EXAMPLES**  
create splitsessionserver my\_splitsessionserver\_profile defaults-from splitsessionserver

**OPTIONS**

listen-ip  
Specifies the IP address that the Splitsession server listens on for the Out-of-band connection. There is no default value for this field. splitsession-default-clientssl and splitsession-default-tcp profiles are used by the Splitsession server for the encrypted Out-of-band channel.

listen-port  
Specifies the port that the Splitsession server listens on for the Out-of-band connection. There is no default value for this field. splitsession-default-clientssl and splitsession-default-tcp profiles are used by the Splitsession server for the encrypted Out-of-band channel.

defaults-from  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is none.

description  
User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**

## ltm profile statistics

NAME statistics - Configures a Statistics profile.

MODULE ltm profile

SYNTAX Configure the statistics component within the ltm profile module using the syntax shown in the following sections.

```
CREATE/MODIFY
create statistics [name]
modify statistics [name]
options:
  app-service [[string] | none]
  defaults-from [ [name] | none]
  description [string]
  field1 [string]
  field2 [string]
  field3 [string]
  field4 [string]
  field5 [string]
  field6 [string]
  field7 [string]
  field8 [string]
  field9 [string]
  field10 [string]
  field11 [string]
  field12 [string]
  field13 [string]
  field14 [string]
  field15 [string]
  field16 [string]
  field17 [string]
  field18 [string]
  field19 [string]
  field20 [string]
  field21 [string]
  field22 [string]
  field23 [string]
  field24 [string]
  field25 [string]
  field26 [string]
  field27 [string]
  field28 [string]
  field29 [string]
  field30 [string]
  field31 [string]
  field32 [string]

edit statistics [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

mv statistics [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [fold
options:
  to-folder

reset-stats statistics
reset-stats statistics [ [ [name] | [glob] | [regex] ] ... ]

DISPLAY
list statistics
list statistics [ [ [name] | [glob] | [regex] ] ... ]
show running-config statistics
show running-config statistics
[ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show statistics
show statistics [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt

DELETE
delete statistics [all | name]
```

## DESCRIPTION

You can use the statistics component to create, modify, display, or delete a Statistics profile that provides user-defined statistical counters.

## EXAMPLES

```
create statistics my_stats_profile defaults-from stats
```

Creates a Statistics profile name `my_stats_profile` that inherits all settings and values from the profile `stats`.

```
list statistics my_stats
```

Displays the configuration of the profile `my_stats`.

```
list statistics my_stats field1 total_users field2 current_users field3 max_users
```

Creates a Statistics profile named `my_stats` with a total users counter in Field 1 and a current users counter in Field 2. You can then write an iRule to count the total number of connections, and record the current number of connections.

For more information about writing and using iRules(r), see the F5 Networks DevCentral web site at .

```
mv statistics /Common/my_statistics_profile to-folder /Common/my_folder
```

Moves a custom statistics profile named `my_statistics_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

## OPTIONS

`app-service`

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

`defaults-from`

Specifies the name of a profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is `stats`.

`description`

User defined description.

`field1 ... field32`

Specifies the name of a counter. You can specify a counter for up to 32 fields. The default value for each field is none.

You can then write an iRule that uses the counter names to gather statistics about the traffic the system is processing.

`glob` Displays the items that match the `glob` expression. See help `glob` for a description of `glob` expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`to-folder`

statistics profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

## SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `modify`, `mv`, `regex`, `show`, `tmsh`

**NAME**  
 stream - Configures a Stream profile.

**MODULE**  
 ltm profile

**SYNTAX**  
 Configure the stream component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**  
 create stream [name]  
 modify stream [name]  
 options:  
   app-service [[string] | none]  
   defaults-from [ [name] | none]  
   description [string]  
   source [none | [string] ]  
   target [none | [string] ]  
   chunking-enabled [disabled | enabled]  
   chunk-size [integer]

edit stream [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
   all-properties  
   non-default-properties

mv stream [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-n  
 options:  
   to-folder

reset-stats stream  
 reset-stats stream [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
 list stream  
 list stream [ [ [name] | [glob] | [regex] ] ... ]  
 show running-config stream  
 show running-config stream  
 [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
   all-properties  
   non-default-properties  
   one-line  
   partition

show stream  
 show stream [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
   (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
   field-fmt  
   global

**DELETE**  
 delete stream [name]

**DESCRIPTION**  
 You can use the stream component to search and replace strings within a data stream, such as a TCP connection.

**EXAMPLES**  
 create stream my\_stream\_profile defaults-from stream  
 Creates a custom Stream profile named my\_stream\_profile that inherits its settings from the system default stream profile.  
 list stream all-properties  
 Displays all properties for all Stream profiles.  
 mv stream /Common/my\_stream\_profile to-folder /Common/my\_folder  
 Moves a custom stream profile named my\_stream\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

**OPTIONS**  
 app-service  
 Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

defaults-from  
 Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is stream.

description  
 User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition  
 Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**source**  
Specifies the string that you want to rewrite. The default value is none.

**target**  
Specifies the new string, to replace the source string. The default value is none.

**chunking**  
Specifies that the stream processor should parse incoming data in chunks. This restricts the maximum amount of additional memory needed by the stream processor. It also limits the maximum length of the value that can be matched to the chunk-size. The default value is disabled.

**chunk-size**  
The maximum size of the parsed chunk.

**to-folder**  
stream profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of /Common.

```

#### DESCRIPTION

You can use the `tcp` component to manage TCP network traffic. Many of the options are standard `SYCTL`-types of options, while others are unique to the traffic management system. For most of the options, the default values usually meet your needs. The specific options that you might want to change are: `reset-on-timeout`, `idle-timeout`, `ip-tos-to-client`, and `link-qos-to-client`.

The system installation includes these default TCP-type profiles: `tc`, `tcp-cell-optimized`, `tcp-lan-optimized`, and `tcp-wan-optimized`. You can modify the settings of these profiles, or create new TCP-type profiles using any of these existing profiles as parent profiles.

#### EXAMPLES

```
create tcp my_tcp_profile defaults-from tcp
```

Creates a custom TCP profile named `my_tcp_profile` that inherits its settings from the system default `tcp` profile.

```
list tcp all-properties
```

Displays all properties for all TCP profiles

#### OPTIONS

abc When enabled, increases the congestion window by basing the increase amount on the number of previously unacknowledged bytes that each acknowledgement code (ACK) includes. The default value is enabled.

ack-on-push  
When enabled, significantly improves performance to Microsoft(r) Windows(r) and MacOS peers, who are writing out on a very small send buffer. The default value is enabled.

app-service  
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

auto-proxy-buffer-size  
Specifies, when enabled, that the system uses the network measurements to set the optimal proxy buffer size. The default value is disabled.

auto-recv-window-size  
Specifies, when enabled, that the system uses the network measurements to set the optimal receive window size. The default value is disabled.

auto-send-buffer-size  
Specifies, when enabled, that the system uses the network measurements to set the optimal send buffer size. The default value is disabled.

close-wait-timeout  
Specifies the number of seconds that a connection remains in a LAST-ACK (last acknowledgement code) state before quitting. A value of 0 (zero) represents a term of forever (or until the maxrtx of the FIN state). The default value is 5 seconds.

cmetrics-cache  
Specifies, when enabled, the default value, that the system uses a cache for storing congestion metrics.

cmetrics-cache-timeout  
Specifies the time, in seconds, for which entries in the congestion metrics cache are valid. The default value is 0, which defers to the sys db variable route.metrics.timeout.

congestion-control  
Specifies the algorithm to use to share network resources among competing users to reduce congestion. The default value is high-speed.

The options are:

cdg Specifies that the system use a Caia Delay-Gradient congestion control algorithm, where congestion inferences are made based on a gradient of RTT over time. Improves inferences made about packet loss and whether they are due to congestion or other factors. The use of a shadow window improves coexistence with loss-based TCP flows.

chd Specifies that the system use a Caia-Hamilton delay-based congestion control algorithm, where delay-based congestion window operations are performed only once per RTT. Tolerates packet losses that are likely to be unrelated to congestion. Uses a shadow window to help regain lost transmission opportunities when competing with loss-based TCP flows.

cubic Specifies that the system uses a component optimized for high latency, high bandwidth connections as the TCP congestion control algorithm.

high-speed  
Specifies that the system uses a more aggressive, loss-based algorithm.

illinois  
Specifies that the system uses a hybrid of both delay and loss as the TCP congestion control algorithm.

new-reno  
Specifies that the system uses a modification to the Reno algorithm that responds to partial acknowledgements when SACKs are unavailable.

none Specifies that the system does not use a network-congestion-control mechanism, even when congestion occurs.

reno Specifies that the system uses an implementation of the TCP Fast Recovery algorithm, which is based on the implementation in the BSD Reno release.

scalable  
Specifies that the system uses a TCP algorithm modification that adds a scalable, delay-based and loss-based component into the Reno algorithm.

vegas Specifies that the system uses a delay-based component as the TCP congestion control algorithm.

westwood  
Specifies that the system uses the Westwood+ bandwidth estimation component as the TCP congestion control

algorithm.

#### woodside

Specifies that the system uses a hybrid of both delay and loss as the TCP congestion control algorithm.

#### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile. The default value is tcp.

#### deferred-accept

Specifies, when enabled, that the system defers allocation of the connection chain context until the system has received the payload from the client. This option is useful for dealing with 3-way handshake denial-of-service (DOS) attacks. The default value is disabled.

#### delay-window-control

When enabled, the system uses an estimate of queueing delay as a measure of congestion, in addition to the normal loss-based control, to control the amount of data sent. The default value is disabled.

#### delayed-acks

Specifies, when enabled, the default value, that the traffic management system allows coalescing of multiple acknowledgement (ACK) responses.

#### description

User defined description.

#### dsack

When enabled, specifies the use of the SACK option to acknowledge duplicate segments. The default is disabled.

#### early-retransmit

Specifies, when enabled, that the system uses early retransmit recovery (as specified in RFC 5827) to reduce the recovery time for connections that are receive-buffer or user-data limited. The default value is disabled.

ecn Specifies, when enabled, that the system uses the TCP flags CWR and ECE to notify its peer of congestion and congestion counter-measures. The default value is disabled.

#### enhanced-loss-recovery

Specifies whether the system uses enhanced loss recovery to recover from random packet losses more effectively. The default value is disabled.

#### fast-open

Specifies, when enabled, that the system supports TCP Fast Open, which allows a client to include the first packet of data with the SYN to reduce latency. The default value is disabled.

#### fast-open-cookie-expiration

Specifies the number of seconds that a "Fast Open Cookie" delivered to a client is valid for SYN packets from that client. The default value is 21600 seconds (6 hours). A value of 0 (zero) means use the default. The maximum value is 1000000 seconds.

#### fin-wait-timeout

Specifies the number of seconds that a connection is in the FIN-WAIT-1 or closing state before quitting. The default value is 5 seconds. A value of 0 (zero) represents a term of forever (or until the maxrtx of the FIN state).

#### fin-wait-2-timeout

Specifies the number of seconds that a connection is in the FIN-WAIT-2 state before quitting. The default value is 300 seconds. A value of 0 (zero) represents a term of forever (or until the maxrtx of the FIN state).

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### hardware-syn-cookie

This option is deprecated in version 13.0.0 and is replaced by syn-cookie-enable. Specifies whether or not to use hardware SYN Cookie when cross system limit. The default value is disabled.

#### idle-timeout

Specifies the number of seconds that a connection is idle before the connection is eligible for deletion. The default value is 300 seconds.

#### init-cwnd

Specifies the initial congestion window size for connections to this destination. The actual window size is this value multiplied by the MSS (Maximum Segment Size) for the same connection. The default value is 3. The range is from 0 to 64.

#### init-rwnd

Specifies the initial receive window size for connections to this destination. The actual window size is this value multiplied by the MSS (Maximum Segment Size) for the same connection. The default value is 3. The range is from 0 to 64.

#### ip-df-mode

Describe the IP Header Don't Fragment (DF) bit setting in the outgoing TCP packet. The available settings are: Pmtu: Set the outgoing IP Header DF bit based on IP pmtu setting(tm.pathmtudiscovery). Preserve: Set the outgoing Packet's

IP Header DF bit to be same as incoming IP Header DF bit. Set: Set the outgoing packet's IP Header DF bit. Clear: Clear the outgoing packet's IP Header DF bit. The default setting is Preserve.

#### ip-ttl-mode

Describe the outgoing TCP packet's IP Header TTL mode. The available Modes are: Proxy: Set the outgoing IP Header TTL value to 255/64 for ipv4/ipv6 respectively. Preserve: Set the outgoing IP Header TTL value to be same as the incoming IP Header TTL value. Decrement: Set the outgoing IP Header TTL value to be one less than the incoming TTL value. Set: Set the outgoing IP Header TTL value to a specific value(as specified by ip-ttl-v[4|6]). The default mode is Proxy.

#### ip-ttl-v4

Specify the outgoing packet's IP Header TTL value for IPv4 traffic. Maximum TTL value that can be specified is 255. The default is 255.

#### ip-ttl-v6

Specify the outgoing packet's IP Header TTL value for IPv6 traffic. Maximum TTL value that can be specified is 255. The default is 64.

#### ip-tos-to-client

Specifies the Type of Service (ToS) level that the traffic management system assigns to TCP packets when sending them to clients. The default value is 0 (zero).

#### keep-alive-interval

Specifies the keep-alive probe interval, in seconds. The default value is 1800 seconds.

#### limited-transmit

Specifies, when enabled, the default value, that the system uses limited transmit recovery revisions for fast retransmits (as specified in RFC 3042) to reduce the recovery time for connections on a lossy network.

#### link-qos-to-client

Specifies the Link Quality of Service (QoS) level that the system assigns to TCP packets when sending them to clients. The default value is 0 (zero).

#### max-retrans

Specifies the maximum number of retransmissions of data segments that the system allows. The default value is 8.

#### md5-signature

Specifies, when enabled, that the system uses RFC2385 TCP-MD5 signatures to protect TCP traffic against intermediate tampering. The default value is disabled.

#### md5-signature-passphrase

Specifies a plain text passphrase which may be between 1 and 80 characters in length, and is used in a shared-secret scheme to implement the spoof-prevention parts of RFC2385. The default value is none.

#### minimum-rto

Specifies the minimum TCP retransmission timeout in milliseconds. The default value is 1000 milliseconds.

#### mptcp

Specifies, when enabled, that the system will accept MPTCP connections. When passthrough MPTCP connections are not terminated by this virtual. The default value is disabled.

#### mptcp-csum

Specifies, when enabled, that the system will calculate the checksum for MPTCP connections. The default value is disabled.

#### mptcp-csum-verify

Specifies, when enabled, that the system verifies checksum for MPTCP connections. The default value is disabled.

#### mptcp-debug

This option is DEPRECATED v12.0.0 onwards and is maintained here for backward compatibility reasons. Specifies, when enabled, that the system provides debug logs and statistics for MPTCP connections. The default value is disabled.

#### mptcp-fallback

Specifies, MPTCP fallback mode. The default value is reset.

The options are:

#### accept

Specifies accept on fallback.

#### active-accept

Specifies active accept on fallback.

#### reset

Specifies that the connection is reset on fallback.

#### retransmit

Specifies retransmit on fallback.

#### mptcp-join-max

Specifies the max number of MPTCP connections that can join to given one. The default value is 5.

**mptcp-nojoindssack**  
Specifies, when enabled, no DSS option is sent on the JOIN ACK. The default value is disabled.

**mptcp-rtomax**  
Specifies, the number of RTOs before declaring subflow dead. The default value is 5.

**mptcp-rxmitmin**  
Specifies the minimum value (in msec) of the retransmission timer for these MPTCP flows. The default value is 1000.

**mptcp-subflowmax**  
Specifies the maximum number of MPTCP subflows for a single flow. The default value is 6.

**mptcp-makeafterbreak**  
Specifies, when enabled, that make-after-break functionality is supported, allowing for long-lived MPTCP sessions. The default value is disabled.

**mptcp-timeout**  
Specifies, the timeout value to discard long-lived sessions that do not have an active flow, in seconds. The default value is 3600.

**mptcp-fastjoin**  
Specifies, when enabled, FAST join, allowing data to be sent on the MP\_JOIN SYN, which can allow a server response to occur in parallel with the JOIN. The default value is disabled.

**nagle**  
Specifies, when enabled, that the system applies Nagle's algorithm to reduce the number of short segments on the network. The default value is disabled. When auto, the use of Nagle's algorithm is decided based on network conditions.

Note that for interactive protocols such as Telnet, rlogin, or SSH, F5 Networks recommends disabling this setting on high-latency networks, to improve application responsiveness.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the administrative partition within which the profile resides.

**pkt-loss-ignore-burst**  
Specifies the probability of performing congestion control when multiple packets in a row are lost, even if the pkt-loss-ignore-rate was not exceeded. Valid values are 0 (zero) through 32. The default value is 0 (zero), which means that the system performs congestion control, if any packets are lost. Higher values decrease the chance of performing congestion control.

**pkt-loss-ignore-rate**  
Specifies the threshold of packets lost per million at which the system should perform congestion control. Valid values are 0 (zero) through 1,000,000. The default value is 0 (zero), which means that the system performs congestion control, if any packet loss occurs. If you set the ignore rate to 10 and packet loss for a TCP connection is greater than 10 per million, congestion control occurs.

**proxy-buffer-high**  
Specifies the highest level at which the receive window is closed. The default value is 49152.

**proxy-buffer-low**  
Specifies the lowest level at which the receive window is closed. The default value is 32768.

**proxy-mss**  
Specifies, when enabled, that the system advertises the same mss to the server as was negotiated with the client. The default value is enabled.

**proxy-options**  
Specifies, when enabled, that the system advertises an option, such as a time-stamp to the server only if it was negotiated with the client. The default value is enabled.

**rate-pace**  
Specifies, when enabled, that the system will rate pace TCP data transmissions. The default value is disabled.

**rate-pace-max-rate**  
If not 0, sets the maximum rate in bytes per second that TCP data transmission will be paced to. If set to 0, no maximum is enforced. The default value is 0.

**receive-window-size**  
Specifies the size of the receive window, in bytes. The default value is 65535 bytes.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**reset-on-timeout**  
Specifies whether to reset connections on timeout. The default value is enabled.

**rexmt-thresh**  
Specifies the number of duplicate ACKs (retransmit threshold) to start fast recovery. The default value is 3. The range is from 3 to 255.

**selective-acks**  
Specifies, when enabled, the default value, that the system negotiates RFC2018-compliant Selective Acknowledgements with peers.

**selective-nack**  
Specifies whether Selective Negative Acknowledgment is enabled or disabled. The default value is enabled.

**send-buffer-size**  
Specifies the size of the buffer, in bytes. The default value is 65535 bytes.

**slow-start**  
Specifies, when enabled, the default value, that the system uses larger initial window sizes (as specified in RFC 3390) to help reduce round trip times. Note that disabling this attribute causes the setting for cmetrics-cache to be ignored.

**syn-cookie-enable**  
Specifies the default (if no DoS profile is associated) number of embryonic connections that are allowed on any virtual server, before SYN Cookie challenges are enabled for that virtual server. The default is enabled.

**syn-cookie-whitelist**  
Specifies whether or not to use a SYN Cookie WhiteList when doing software SYN Cookies. This means not doing a SYN Cookie for the same src IP address if it has been done already in the previous tm.flowstate.timeout (30) seconds. The default value is disabled.

**syn-max-retrans**  
Specifies the maximum number of retransmissions of SYN segments that the system allows. The default value is 3.

**syn-rto-base**  
Specifies the initial RTO (Retransmission TimeOut) base multiplier for SYN retransmission, in milliseconds. This value is modified by the exponential backoff table to select the interval for subsequent retransmissions. The default value is 3000.

**tail-loss-probe**  
Specifies whether the system uses tail loss probe to reduce the number of retransmission timeouts. The default value is disabled.

**tcp-options**  
Specifies the option numbers that will be accessible from iRules (TCP::option) for the flow. The format of each entry should be:  
"{

  field-fmt
  global

DELETE
delete tcp-analytics [name]

```

#### DESCRIPTION

You can use the tcp-analytics component to generate detailed TCP statistics for virtuals that have a TCP or FastL4 profile, if AVR is provisioned. The options specify where the data is collected and stored, and which connection identifiers ("entities") users can query the data with.

In general, storing more entities increases the ability to drill down to specific connections. However, if AVR hits its memory limits it will begin to aggregate new connections and reduce this resolution. If a virtual serves a very high number of IP addresses, for example, it is best to store data using collect-remote-host-subnet, or use the TCP::analytics iRule to enhance collection for a set of IP addresses of interest.

The system installation includes the default profile tcp-analytics. You can modify the settings of this profile, or create new TCP analytics profiles using it as a parent profile.

#### EXAMPLES

```
create ltm profile tcp-analytics my_tcpanalytics_profile defaults-from
tcp-analytics
```

Creates a custom TCP profile named my\_tcpanalytics\_profile that inherits its settings from the system default tcp-analytics profile.

```
list ltm profile tcp-analytics all-properties
```

Displays all properties for all TCP profiles

#### OPTIONS

##### collected-by-client-side

When enabled, client side connections collect TCP analytics data unless directed otherwise by iRule. If false, client side connections only collect data if directed by iRule. The default value is enabled.

##### collected-by-server-side

When enabled, server side connections collect TCP analytics data unless directed otherwise by iRule. If false, server side connections only collect data if directed by iRule. The default value is disabled.

##### collected-stats-external-logging

When enabled, TCP statistics are logged on a remote machine determined by external-logging-publisher. The default value is disabled.

##### collected-stats-internal-logging

When enabled, TCP statistics are logged on the local BIG-IP. The default value is enabled.

##### collect-city

When enabled, AVR stores the city (from the GeoIP database) for the remote IP address of the connection with TCP statistics. See SOL11176 on support.f5.com for more on GeoIP. The default value is disabled.

##### collect-continent

When enabled, AVR stores the continent (from the GeoIP database) for the remote IP address of the connection with TCP statistics. See SOL11176 on support.f5.com for more on GeoIP. The default value is enabled.

##### collect-country

When enabled, AVR stores the country (from the GeoIP database) for the remote IP address of the connection with TCP statistics. See SOL11176 on support.f5.com for more on GeoIP. The default value is enabled.

##### collect-nexthop

When enabled, AVR stores the nexthop ethernet address of the connection with TCP statistics. The default value is disabled.

##### collect-post-code

When enabled, AVR stores the postcode (from the GeoIP database) for the remote IP address of the connection with TCP statistics. See SOL11176 on support.f5.com for more on GeoIP. The default value is disabled.

##### collect-region

When enabled, AVR stores the region (from the GeoIP database) for

the remote IP address of the connection with TCP statistics. See SOL11176 on support.f5.com for more on GeoIP. The default value is disabled.

**collect-remote-host-ip**  
When enabled, AVR stores the remote host IP address with TCP statistics. The default value is disabled.

**collect-remote-host-subnet**  
When enabled, AVR stores the remote host IP subnet (24-bit) with TCP statistics. The default value is enabled.

**defaults-from**  
Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile. The default value is tcp-analytics.

**description**  
User defined description.

**external-logging-publisher**  
The name of the publisher to accept external logging.

## ltm profile tftp

**NAME**  
tftp - Configures a TFTP profile.

**MODULE**  
ltm profile

**SYNTAX**  
Configure the tftp component within the ltm profile module using the syntax shown in the following sections.

#### CREATE/MODIFY

create tftp [name]

modify tftp [name]

##### options:

app-service [[string] | none]

defaults-from [ [name] | none]

description [string]

idle-timeout [integer]

log-publisher [log publisher name | none]

log-profile [log profile name | none]

mv tftp [ [source-name] [destination-name] ] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]]

##### options:

to-folder

edit tftp [ [ [name] | [glob] | [regex] ] ... ]

##### options:

all-properties

non-default-properties

#### DISPLAY

list tftp

list tftp [ [ [name] | [glob] | [regex] ] ... ]

show running-config tftp

show running-config tftp [ [ [name] | [glob] | [regex] ] ... ]

##### options:

all-properties

non-default-properties

one-line

partition

#### DELETE

delete tftp [name]

#### DESCRIPTION

Use this command to create, modify, display, or delete an TFTP profile with which you can manage TFTP traffic.

#### EXAMPLES

create tftp my\_tftp\_profile defaults-from tftp

Creates a custom TFTP profile named `my_tftp_profile` that inherits its settings from the system default TFTP profile.

`list tftp`

Displays the properties of all TFTP profiles.

`mv tftp /Common/my_tftp_profile to-folder /Common/my_folder`

Moves a custom tftp profile named `my_tftp_profile` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

#### OPTIONS

`app-service`

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

`defaults-from`

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is `tftp`.

`description`

User defined description.

`glob` Displays the items that match the glob expression. See help `glob`

for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required

for the commands `create`, `delete`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

`to-folder`

tftp profiles can be moved to any folder under `/Common`, but configuration dependencies may restrict moving the profile out of `/Common`.

`idle-timeout`

Specifies an idle timeout in seconds. This setting specifies the number of seconds that a connection is idle before the connection is eligible for deletion. The default value is 300 seconds.

`log-publisher`

Specify the name of the log publisher which logs translation events. See help `sys log-config` for more details on the logging sub-system. Use the "sys log-config publisher" component to set up a log publisher.

`log-profile`

Specify the name of the ALG log profile which controls the logging of ALG events. See help `ltm alg-log-profile` for more details on the logging profile sub-system. Use the "ltm alg-log-profile profile" component to set up an ALG log profile.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm virtual`, `modify`, `mv`, `regex`, `reset-stats`, `show`, `tmsh`

#### COPYRIGHT

## ltm profile traffic-acceleration

#### NAME

`traffic-acceleration` - Configures a Traffic Acceleration profile.

#### MODULE

`ltm profile`

## SYNTAX

Configure the traffic-acceleration component within the ltm profile module using the syntax shown in the following sections.

### CREATE/MODIFY

```
create traffic-acceleration [name]
modify traffic-acceleration [name]
options:
  app-service [[string] | none]
  defaults-from [ [name] | none]
  description [string]
  idle-timeout [integer]
  tcp-handshake-timeout [integer]
  time-wait-timeout [integer]

edit traffic-acceleration [ [name] | [regex] ]
options:
  all-properties
  non-default-properties

reset-stats traffic-acceleration
reset-stats traffic-acceleration [ [name] | [regex] ]
```

### DISPLAY

```
list traffic-acceleration
list traffic-acceleration [ [name] | [regex] ]
show running-config traffic-acceleration
show running-config traffic-acceleration [ [name] | [regex] ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show traffic-acceleration
show traffic-acceleration [ [name] | [regex] ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global
```

### DELETE

```
delete traffic-acceleration [name]
```

## DESCRIPTION

You can use this component to create, modify, display, or delete a Traffic Acceleration profile.

Any changes you make to an active Traffic Acceleration profile (one that is in use by a virtual server) take effect after the value of the idle-timeout option has passed. That means new connections are affected by the profile change immediately. However, for the new values to take effect, old connections need to be either aged out or closed.

## EXAMPLES

```
create traffic-acceleration my_profile defaults-from traffic-
acceleration
```

Creates a custom Traffic Acceleration profile named my\_profile that inherits its settings from the system default Traffic Acceleration profile.

```
show traffic-acceleration
```

Displays statistics for all Traffic Acceleration profiles.

## OPTIONS

### app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is traffic-acceleration.

### description

User defined description.

### idle-timeout

Specifies the number of milliseconds that a connection is idle before the connection is eligible for deletion. The default value is five minutes or 300000 milliseconds. Minimum is 0 meaning the connection does not timeout. The maximum is 2147483647 (0x7FFFFFFF) milliseconds.

### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

### tcp-handshake-timeout

Specifies a TCP handshake timeout in milliseconds. The default value is 5000 milliseconds. Minimum is 0 meaning there is no timeout. The maximum is 65535 milliseconds.

### time-wait-timeout

Specifies a TCP time\_wait timeout in milliseconds. The default value is 2000 milliseconds. The minimum is 1 millisecond. The maximum is 65535 milliseconds.

**SEE ALSO**

## ltm profile udp

**NAME**

udp - Configures a User Datagram Protocol (UDP) profile.

**MODULE**

ltm profile

**SYNTAX**

Configure the udp component within the ltm profile module using the syntax shown in the following sections.

**CREATE/MODIFY**

```
create udp [name]
modify udp [name]
```

**options:**

```
allow-no-payload [disabled | enabled]
app-service [[string] | none]
buffer-max-bytes [integer]
buffer-max-packets [integer]
datagram-load-balancing [disabled | enabled]
defaults-from [[name] | none]
description [string]
idle-timeout [immediate | indefinite | integer]
ip-tos-to-client [[integer] | pass-through]
link-qos-to-client [[integer] | pass-through]
no-checksum [disabled | enabled]
proxy-mss [disabled | enabled]
ip-ttl-mode [proxy | preserve | decrement | set]
ip-ttl-v4 [integer]
ip-ttl-v6 [integer]
ip-df-mode [pmtu | preserve | set | clear]
```

```
edit udp [ [name] | [glob] | [regex] ] ... ]
```

**options:**

```
all-properties
non-default-properties
```

```
mv udp [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name
```

**options:**

```
to-folder
```

```
reset-stats udp
```

```
reset-stats udp [ [name] | [glob] | [regex] ] ... ]
```

**DISPLAY**

```
list udp
```

```
list udp [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config udp
```

```
show running-config udp
```

```
[ [name] | [glob] | [regex] ] ... ]
```

**options:**

```
all-properties
non-default-properties
one-line
partition
```

```
show udp
```

```
show udp [ [name] | [glob] | [regex] ] ... ]
```

**options:**

```
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
field-fmt
global
```

**DELETE**

```
delete udp [name]
```

**DESCRIPTION**

You can use the udp component to manage UDP network traffic.

**EXAMPLES**

```
create udp my_udp_profile defaults-from udp
```

Creates a custom UDP profile named my\_udp\_profile that inherits its

settings from the system default UDP profile.

list udp all-properties

Displays all properties for all UDP profiles.

mv udp /Common/my\_udp\_profile to-folder /Common/my\_folder

Moves a custom udp profile named my\_udp\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

allow-no-payload

Provides the ability to allow the passage of datagrams that contain header information, but no essential data. The default is disabled.

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

buffer-max-bytes

Specifies ingress buffer byte limit. The default value is 655350. Maximum allowed value is 16777215.

buffer-max-packets

Specifies ingress buffer packet limit. The default value is 10. Maximum allowed value is 255.

datagram-load-balancing

Provides the ability to load balance UDP datagram by datagram. The default is disabled.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile. The default value is udp.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

idle-timeout

Specifies the number of seconds that a connection is idle before the connection is eligible for deletion. The default value is 60 seconds.

ip-tos-to-client

Specifies the Type of Service level that the traffic management system assigns to UDP packets when sending them to clients. The default value is 0 (zero).

ip-ttl-mode

Describe the outgoing UDP packet's TTL mode. Modes are: Proxy: Set the IP TTL of ipv4 to the default value of 255 and ipv6 to the default value of 64. Preserve: Set the IP TTL to the original packet TTL value. Decrement: Set the IP TTL to the original packet TTL value minus 1. Set: Set the IP TTL with the specified values in ip-ttl-v4 and ip-ttl-v6 values in the same profile.

ip-df-mode

Describe the Don't Fragment (DF) bit setting in the outgoing UDP packet. Pmtu: Set the outgoing UDP packet DF big based on the ip pmtu setting. Preserve: Preserve the incoming UDP packet Don't Fragment bit. Set: Set the outgoing UDP packet DF bit. Clear: Clear the outgoing UDP packet DF bit.

link-qos-to-client

Specifies the Quality of Service level that the system assigns to UDP packets when sending them to clients. The default value is 0 (zero).

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

no-checksum

Enables or disables checksum processing. Note that if the datagram is IPv6, the system always performs checksum processing. The default value is disabled.

partition

Displays the administrative partition within which the profile resides.

proxy-mss

Specifies, when enabled, that the system advertises the same mss to the server as was negotiated with the client. The default value is disabled.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

to-folder

udp profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of

/Common.

## ltm profile wa-cache

NAME

wa-cache - Manages the BIG-IP(r) system WebAccelerator cache.

MODULE

ltm profile

SYNTAX

Configure the wa-cache component within the ltm profile module using the syntax shown in the following sections.

DELETE

delete wa-cache [name]

DESCRIPTION

You can use the wa-cache component to delete the entries in the BIG-IP(r) system WebAccelerator cache.

EXAMPLES

delete wa-cache

Deletes the entries in the BIG-IP system WebAccelerator cache.

SEE ALSO

options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global

DELETE
delete web-acceleration [name]

DESCRIPTION
  You can use the web-acceleration component to create, modify, display,
  or delete an Web Acceleration profile.

  The BIG-IP(r) system installation includes the following default Web
  Acceleration-type profiles:

  web-acceleration
  optimized-caching
  optimized-acceleration

  The default Web Acceleration profile contains values for properties
  related to managing WA Cache.

  You can create a new Web Acceleration-type profile using an existing
  profile as a parent profile, and then you can change the values of the
  properties to suit your needs.

EXAMPLES
  create web-acceleration my_wa_profile defaults-from web-acceleration

  Creates a custom Web Acceleration profile named my_wa_profile that
  inherits its settings from the system default Web Acceleration profile.

OPTIONS
  applications
  Configures a list of applications assigned to this profile.
  Assigning at least one application enables WA functionality. The
  default value of none specifies that WA is not enabled.

  app-service
  Specifies the name of the application service to which the profile
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the profile. Only the application
  service can modify or delete the profile.

  cache-aging-rate
  Specifies how quickly the system ages a cache entry. The aging
  rate ranges from 0 (slowest aging) to 10 (fastest aging). The
  default value is 9.

```

**cache-client-cache-control-mode**  
Specifies which cache disabling headers sent by clients the system ignores. The default value is all.

**cache-insert-age-header**  
When enabled, inserts Age and Date headers in the response. The default value is enabled.

**cache-max-age**  
Specifies how long the system considers the cached content to be valid. The default value is 3600 seconds.

**cache-max-entries**  
Specifies the maximum number of entries that can be in the WA cache. The default value is 10000.

**cache-object-max-size**  
Specifies the largest object that the system considers eligible for caching. The default value is 50000 bytes.

**cache-object-min-size**  
Specifies the smallest object that the system considers eligible for caching. The default value is 500 bytes.

**cache-size**  
Specifies the maximum size, in megabytes, for the WA cache. When the cache reaches the maximum size, the system starts removing the oldest entries. The default value is 100 megabytes.

**cache-uri-exclude**  
Configures a list of Uniform Resource Identifiers (URIs) to exclude from the WA Cache. The default value is none and specifies that no URI will be excluded.

**cache-uri-include**  
Configures a list of URIs that are cacheable. The default value is .\* and specifies that all URIs are cacheable.

**cache-uri-include-override**  
Configures a list of URIs that should be cached in the WA cache even though they would normally not be cached due to constraints defined by cache-object-max-size or others. The default value is none. URIs on the cache-uri-include-override list are cacheable even if they are not on the cache-uri-include list.

**cache-uri-pinned**  
Configures a list of URIs that are kept in the WA cache regardless their max-age or expiry settings. The default value is none. URIs on the cache-uri-pinned list are cacheable even if they are not on the cache-uri-include list.

**metadata-cache-max-size**  
Specifies the maximum size of the metadata cache. The metadata cache applies only when there is an application applied to the profile, and does not include the content cache.

**defaults-from**  
Configures the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is webacceleration.

**description**  
User defined description.

**partition**  
Displays the administrative partition within which the profile resides.

## ltm profile web-security

**NAME**  
web-security - Configures a Web Security profile.

**MODULE**

ltm profile

#### SYNTAX

Configure the web-security component within the ltm profile module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create web-security [name]
modify web-security [name]
options:
  defaults-from [ [name] | none]

edit web-security [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

##### DISPLAY

```
list web-security
list web-security [ [name] | [glob] | [regex] ] ... ]
... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

##### DELETE

```
delete web-security [name]
```

#### DESCRIPTION

You can use the web-security component to create, modify, display, or delete an Web Security profile.

The BIG-IP(r) system installation includes the following default Web Security-type profiles:

websecurity

The default Web Security profile contains values for properties related to managing web security.

You can create a new Web Security-type profile using an existing profile as a parent profile, and then you can change the values of the properties to suit your needs.

#### EXAMPLES

```
create web-security my_asm_profile defaults-from web-security
```

Creates a custom Web Security profile named `my_asm_profile` that inherits its settings from the system default Web Security profile.

#### OPTIONS

**defaults-from**  
Configures the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is none.

**partition**  
Displays the administrative partition within which the profile resides.

#### SEE ALSO

create, delete, edit, glob, list, ltm profile fasthttp, ltm virtual, modify, regex, reset-stats, show, tmsh

## ltm profile websocket

#### NAME

websocket - Configures a WebSocket protocol profile.

#### MODULE

websocket profile

#### SYNTAX

Configure the websocket component within the ltm profile module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create websocket [name]
```

```

modify websocket [name]
  options:
    masking [preserve | unmask | remask | selective]

DISPLAY
list websocket
list websocket [ [ [name] | [glob] | [regex] ] ... ]
show running-config websocket
show running-config websocket [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

show websocket
show websocket [ [ [name] | [glob] | [regex] ] ... ]
  options:
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    field-fmt
    global

DELETE
delete websocket [name]

DESCRIPTION
Use this command to create, modify, display, or delete a WebSocket
profile.

EXAMPLES
create websocket my_websocket_profile defaults-from websocket

OPTIONS
masking
Specifies the masking operation for WebSocket frames.

preserve
Maintains the mask of the packet received from the client.

unmask
Removes the mask from the packet and remasks it using the same
mask when sending the traffic to the server.

remask
Removes the mask received from the client and the system generates
a new, random mask when sending the traffic to the server.

selective
Preserves the mask of the packet received, and makes no changes
unless an Application Security Policy is associated with the
virtual server.

defaults-from
Specifies the profile that you want to use as the parent profile.
Your new profile inherits all settings and values from the parent
profile specified. The default value is none.

description
User defined description.

glob
Displays the items that match the glob expression. See help glob
for a description of glob expression syntax.

name
Specifies a unique name for the component. This option is required
for the commands create, delete, and modify.

regex
Displays the items that match the regular expression. The regular
expression must be preceded by an at sign (@[regular expression])
to indicate that the identifier is a regular expression. See help
regex for a description of regular expression syntax.

SEE ALSO
create, delete, edit, glob, list, ltm profile fasthttp, ltm virtual,
modify, regex, reset-stats, show, tmsh

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or
by any means, electronic or mechanical, including photocopying,

## ltm profile xml

NAME

xml - Configures an XML profile.

#### MODULE

ltm profile

#### SYNTAX

Configure the xml component within the ltm profile module using the syntax shown in the following sections.

##### CREATE/MODIFY

create xml [name]

modify xml [name]

##### options:

app-service [[string] | none]

defaults-from [ [name] | none]

description [string]

namespace-mappings [ [none] |

[ { { mapping-namespace namespace1 mapping-prefix prefix1 } } ]

xpath-queries [ none |

[ add | delete | replace\_all\_with { queries } ] ]

multiple-query-matches [enabled | disabled]

edit xml [ [ [name] | [glob] | [regex] ] ... ]

##### options:

all-properties

non-default-properties

mv xml [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name

##### options:

to-folder

##### DISPLAY

list xml

list xml [ [ [name] | [glob] | [regex] ] ... ]

show running-config xml

show running-config xml [ [ [name] | [glob] | [regex] ] ... ]

##### options:

all-properties

non-default-properties

one-line

partition

##### DELETE

delete xml [name]

#### DESCRIPTION

Use this command to create, modify, display, or delete an XML profile with which you can use XML functionality.

#### EXAMPLES

```
create xml my_xml_profile defaults-from xml
```

Creates a custom XML profile named my\_xml\_profile that inherits its settings from the system default XML profile.

```
list xml
```

Displays the properties of all XML profiles.

```
mv xml /Common/my_xml_profile to-folder /Common/my_folder
```

Moves a custom xml profile named my\_xml\_profile to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is xml.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition

Displays the administrative partition within which the component resides.

namespace-mappings

Specifies a list of mappings between namespaces and prefixes to be used in the XPath queries of the profile.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

to-folder

xml profiles can be moved to any folder under /Common, but configuration dependencies may restrict moving the profile out of

/Common.

**xpath-queries**  
Specifies the list of XPath queries that are used by the profile.  
A match of any of the queries will trigger the XML\_CONTENT\_BASED\_ROUTING iRule event.

**multiple-query-matches**  
Enables or disables multiple matches for a single XPath query.

SEE ALSO

create, delete, edit, glob, list, ltm virtual, modify, mv, regex, reset-stats, show, tmsh

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2014-01-07 ltm profile xml(1)

---

## ltm rule

NAME

rule - Configures an iRule for traffic management system configuration.

MODULE

ltm

SYNTAX

Configure the rule component within the ltm module using the syntax shown in the following sections.

CREATE/MODIFY

```
create rule [name]
edit rule [name]
modify rule [ [name] | [glob] | [regex] ] ... ]
```

Note: When using tmsh, you can only create iRules using the editor, which starts when you use the create or edit commands. You cannot create an iRule directly on the command line. The vim editor applies the autoindent and smartindent options. You can toggle on/off paste mode using the F12 key.

Note: You can also edit user metadata associated with an iRule. See the example section for more information.

DISPLAY

```
list rule
list rule [ [name] | [glob] | [regex] ] ... ]
show running-config rule
show running-config rule [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

show rule

```
show rule [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
```

```
mv rule [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder [folder-name]] ]
options:
  to-folder
```

DELETE

```
delete rule [name]
```

GENERATE

```
generate rule [name]
options:
  checksum
  signature
```

HELP help rule help rule [ command | event | namespace ] [name]

DESCRIPTION

You cannot edit the system rules that come with the BIG-IP system. However, you can open a system rule in the editor and use it as a template to create a new rule.

To create a new rule using a system rule as a template:

1. Enter the command sequence edit rule [system rule name]. tmsh opens the system rule in an editor.

2. Change the name of the rule in the editor.
  3. Edit the rule and exit the editor.
- tmsh checks for syntax errors, and if there are none, it saves the new rule.

For more information about iRules(r), see <http://devcentral.f5.com/>.

#### EXAMPLES

```
list rule
```

Displays all iRules.

```
delete rule my_irule
```

Deletes the iRule named my\_irule.

```
rule my_irule {
when RULE_INIT {
}
priority 1

when SERVER_CONNECTED {
}
timing on
check strict
}
```

Creates an iRule named my\_irule.

```
generate rule my_irule checksum
```

Generates a checksum for the rule definition and adds the checksum to the rule.

```
generate rule my_irule signature signing-key my_key
```

Generates a signature for the rule definition using the specified private key and adds the signature to the rule.

Note: For a rule that includes a checksum or signature to successfully load, the rule definition contents must match the stored checksum or signature. To modify the rule definition and still retain the checksum or signature, the ignore-verification attribute must be set to true. This is done by editing the rule and adding the ignore-verification attribute, which allows the modified rule to load and changes the verification status to Not Verified:

```
rule my_irule {
when RULE_INIT {
definition-checksum 7c0dba9aa53e8959042c6cfe041d3d11
ignore-verification true }
```

Modifies an existing iRule named my\_irule by adding a new metadata and modifying an existing metadata:

```
modify rule my_irule {
when RULE_INIT {
definition-checksum 7c0dba9aa53e8959042c6cfe041d3d11
metadata replace-all-with {
my_meta { persist false
value "hello"
}
my_meta2 { persist false
value "hello 2"
}
}
} }
```

The metadata attribute is the user defined key/value pair. Metadata has the following format:

```
metadata
[add | delete | modify] {
[metadata_name] {
value [ "value content" ]
persist [ true | false ]
} }>
```

Deletes a metadata from an iRule:

```
modify rule my_irule {
when RULE_INIT {
definition-checksum 7c0dba9aa53e8959042c6cfe041d3d11
metadata delete { my_meta } }
```

```
mv /ltm rule /Common/my_rule to-folder /Common/some_folder
```

Moves an iRule named my\_rule to the folder named some\_folder, where some\_folder has already been created under /Common.

Note: Please note that you may not move an iRule that has an explicit usage of a configuration object, such as a pool.

#### OPTIONS

**checksum**

Generates a checksum for the rule definition and adds the checksum to the rule. This option is used only with the generate command.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the create, delete, and modify commands.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**signature**

Generates a signature for the rule definition using the specified private key and adds the signature to the rule as a property. This option is used only with the generate command.

**signing-key**

Specifies the private key to use for signing the rule. This is used only with the signature option.

**meta-data**

Specifies the user-defined key/value pair associated with the rule. See the example section for usage format.

**app-project**

Specifies the dev plugin this rule belongs to. This is a read-only attribute.

**SEE ALSO**

create, delete, edit, generate, glob, list, modify, mv, regex, show, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008-2010, 2012-2013. All rights reserved.

## ltm snat-translation

**NAME**

snat-translation - Configures an explicit secure network address translation (SNAT) translation address.

**MODULE**

ltm

**SYNTAX**

Configure the snat-translation component within the ltm module using the syntax shown in the following sections.

**CREATE/MODIFY**

```
create snat-translation [all | [name] ]
modify snat-translation [all | [name] ]
```

**options:**

```
address [ip address]
arp [disabled | enabled]
app-service [[string] | none]
connection-limit [integer]
description [string]
[disabled | enabled]
ip-idle-timeout [indefinite | [integer] ]
tcp-idle-timeout [indefinite | [integer] ]
udp-idle-timeout [indefinite | [integer] ]
traffic-group [[string] | default | non-default | none]
```

```
edit snat-translation [ [ [name] | [glob] | [regex] ] ... ]
```

**options:**

```
all-properties
non-default-properties
```

**DISPLAY**

```
list snat-translation
list snat-translation [ [ [name] | [glob] | [regex] ] ... ]
show running-config snat-translation
show running-config snat-translation [ [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties
one-line
```

```
show snat-translation
```

```
show snat-translation [ [ [name] | [glob] | [regex] ] ... ]
```

**options:**

```
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
field-fmt
```

**DELETE**

```
delete snat-translation [all | [name] ]
```

**DESCRIPTION**

Explicitly defines the properties of a SNAT translation address.

#### EXAMPLES

```
modify snat-translation all arp disabled
```

Disables Address Resolution Protocol (ARP) on all SNAT translation addresses.

```
list snat-translation all-properties
```

Displays all properties of all SNAT translation addresses.

#### OPTIONS

**address**  
The translation IP address.

**arp** Indicates whether the system responds to ARP requests or sends gratuitous ARPs. The default value is enabled.

**app-service**  
Specifies the name of the application service to which this object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this object. Only the application service can modify or delete this object.

**connection-limit**  
Specifies the number of connections a translation address must reach before it no longer initiates a connection. The default value of 0 (zero) indicates that the option is disabled.

**description**  
User defined description.

**disabled**  
Disables SNAT translation.

**enabled**  
Enables SNAT translation. The default value is enabled.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**traffic-acceleration-status**  
Displays the current traffic-acceleration status. Indicates whether the SNAT address is (indirectly via a SNAT pool) in-use by or dedicated to a virtual server that uses a traffic-acceleration profile.

**ip-idle-timeout**  
Specifies the number of seconds that IP connections initiated using a SNAT address are allowed to remain idle before being automatically disconnected. The default value is indefinite.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**tcp-idle-timeout**  
Specifies the number of seconds that TCP connections initiated using a SNAT address are allowed to remain idle before being automatically disconnected. The default value is indefinite.

**udp-idle-timeout**  
Specifies the number of seconds that UDP connections initiated using a SNAT address are allowed to remain idle before being automatically disconnected. The default value is indefinite.

**unit** Read-only property that specifies the unit in a redundant system. Derived from traffic-group.

**traffic-group**  
Specifies the traffic group of the failover device group on which the SNAT is active. The default traffic group is inherited from the containing folder.

**inherited-traffic-group**  
Read-only property that indicates if the traffic-group is inherited from the parent folder.

#### SEE ALSO

create, delete, edit, glob, list, modify, ltm snat, ltm snatpool, regex, show, tmsh

## ltm snat

**NAME**  
snat - Configures secure network address translation (SNAT).

**MODULE**  
ltm

**SYNTAX**  
Configure the snat component within the ltm module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create snat [name]  
modify snat [name]  
options:  
  (automap | none)  
  auto-lasthop [default | enabled | disabled ]  
  app-service [[string] | none]  
  description [string]  
  mirror { [disabled | enabled | none] }  
  origins  
    [add | delete | replace-all-with] {  
    [address ... | address/mask ... ]  
    }  
  snatpool [ name ]  
  source-port [change | preserve | preserve-strict ]  
  translation [translation name ... ]  
  vlans  
    [add | delete | replace-all-with] {  
    [vlan name ... ]  
    }  
  vlans [ default | none]  
  [vlans-disabled | vlans-enabled ]  
  metadata  
    [add | delete | modify] {  
    [metadata name ... ] {  
    value [ "value content" ]  
    persist [ true | false ]  
    }  
  }  
}

edit snat [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list snat  
list snat [ [ [name] | [glob] | [regex] ] ... ]  
show running-config snat  
show running-config snat [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line

show snat  
show snat [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
  detail  
  field-fmt

**DELETE**  
delete snat [name]

**DESCRIPTION**  
You can use the snat component to configure a SNAT. A SNAT defines the relationship between an externally visible IP address, SNAT IP address, or translated address, and a group of internal IP addresses, or originating addresses, of individual servers at your site.

**EXAMPLES**  
create snat my\_snat origins add { 10.1.1.3 } translation  
mySnatTranslation  
  
Creates the SNAT my\_snat that translates the address of connections that originate from the address 10.1.1.3 to the translation address mySnatTranslation.  
  
list snat all-properties  
  
Displays all properties for all SNATs.

**OPTIONS**  
automap  
Specifies that the system translates the source IP address to an available self IP address when establishing connections through the virtual server. You can use this option only if you do not use the snatpool and translation options.  
  
Note that when you use the edit command to create a new snat, by default automap is enabled. If you do not want to use automap, you must turn this feature off by using the none option.  
  
app-service  
Specifies the name of the application service to which this object

belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this object. Only the application service can modify or delete this object.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**mirror**  
Enables or disables mirroring of SNAT connections. The default value is none.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**origins**  
Specifies a set of IP addresses and subnets from which connections originate. This option is required.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**snatpool**  
Specifies the name of a SNAT pool. You can only use this option if you do not use the automap and translation options.

**source-port**  
Specifies whether the system preserves the source port of the connection. The default value is preserve.

The options are:

**change**  
Use this setting to obfuscate internal network addresses.

**preserve**  
Specifies to preserve the source port of the connection.

**preserve-strict**  
Use this value only for UDP under very special circumstances such as nPath or transparent (that is, no translation of any other L3/L4 field), where there is a 1:1 relationship between virtual IP addresses and node addresses, or when clustered multi-processing (CMP) is disabled.

**translation**  
Specifies the name of a translated IP address. Note that translated addresses are outside the traffic management system. You can use this option only if you do not use the automap and snatpool options.

**vlan**  
Specifies the name of the VLAN to which you want to assign the SNAT. The default value is none.

**vlan-disabled**  
Disables the SNAT for all specified VLANs. When the "vlan" value is set to "none", the "vlan-disabled" option enables the SNAT on all VLANs.

**vlan-enabled**  
Enables the SNAT for all specified VLANs. When the "vlan" value is set to "none", the "vlan-enabled" option disables the SNAT on all VLANs.

**metadata**  
Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

BIG-IP 2016-03-14 ltm snat(1)

NAME  
snatpool - Configures a secure network address translation (SNAT) pool.

MODULE  
ltm

SYNTAX  
Configure the snatpool component within the ltm module using the syntax shown in the following sections.

CREATE/MODIFY  
create snatpool [name]  
modify snatpool [name]  
options:  
  app-service [[string] | none]  
  description [string]  
  members  
    [add | delete | replace-all-with] {  
    [ip address ... ]  
    }  
  members [default | none]

edit snatpool [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

reset-stats snatpool  
reset-stats snatpool [ [ [name] | [glob] | [regex] ] ... ]

DISPLAY  
list snatpool  
list snatpool [ [ [name] | [glob] | [regex] ] ... ]  
show running-config snatpool  
show running-config snatpool [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line

show snatpool  
show snatpool [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
  detail  
  field-fmt

DELETE  
delete snatpool [name]

DESCRIPTION  
A SNAT pool is a pool of translation addresses that you can map to one or more original IP addresses. Translation addresses in a SNAT pool are not self-IP addresses. You can simply create a SNAT pool and then assign it as a resource directly to a virtual server. This eliminates the need for you to explicitly define original IP addresses to which to map translation addresses.

EXAMPLES  
create snatpool my\_snat\_pool1 members add { 11.12.11.24 11.12.11.25 }  
  
Creates the SNAT pool my\_snat\_pool1 that contains the translation addresses (members) 11.12.11.24 and 11.12.11.25.  
  
delete snatpool my\_snat\_pool1  
  
Deletes the SNAT pool named my\_snat\_pool1.

OPTIONS  
app-service  
Specifies the name of the application service to which this object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this object. Only the application service can modify or delete this object.

description  
User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

traffic-acceleration-status  
Displays the current traffic-acceleration status. Indicates whether the SNAT pool is in-use by or dedicated to a virtual server that uses a traffic-acceleration profile.

members  
Specifies translation IP addresses of the pools in the SNAT pool.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

## ltm tacdb customdb-file

### NAME

customdb-file - Manages a custom TACDB file

### MODULE

ltm tacdb

### SYNTAX

List the customdb-file component within the ltm tacdb module using the syntax in the following sections.

#### CREATE

```
create customdb-file [name]
options:
  source-path [string]
  app-service [name]
```

DEPRECATED: Though this command is visible, this is not meant to be used by the users. The daemons use it internally.

#### DISPLAY

```
list customdb-file [[name] | all | [property]]
options:
  all-properties
  one-line
  partition
```

#### DELETE

```
delete customdb-file [[name] | all]
```

DEPRECATED: Though this command is visible, this is not meant to be used by the users. The daemons use it internally.

### DESCRIPTION

The customdb-file is created internally using the URL specified in ltm tacdb customdb.

### EXAMPLES

```
create customdb-file new { source-path file:/shared/images/new.txt }
```

Creates a new customdb file object, "new" from the source file /shared/images/new.txt

```
list customdb-file [fileobj-name]
```

Lists the attributes of customdb file object, "new" from the source file /shared/images/new.txt

### OPTIONS

#### create

Creates a new file object for custom tacdb.

#### delete

Deletes the file object that you specify next.

#### source-path

Specifies the location from where the TACDB file object sources the file.

#### app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

#### description

User defined description for this customdb file object.

#### partition

Displays the administrative partition within which the component resides.

### SEE ALSO

edit, list, tmsh

## COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008, 2012-2015. All rights reserved.

BIG-IP 2015-05-12 ltm tacdb customdb-file(1)

---

## ltm tacdb customdb

### NAME

customdb - Configures a custom tacdb to be used for file loads. A customdb includes a URL (including local file paths) from where TACDB files are loaded. These files contain TAC code information.

### MODULE

ltm tacdb

### SYNTAX

Configure the customdb component within the ltm tacdb module using the syntax in the following sections.

#### CREATE/MODIFY

```
create customdb [name]
modify customdb [[name] | all]
options:
  url [string]
  poll-interval [integer]
  user [string]
  password [string]
  priority [ high | low ]
  app-service [name]
  description [string]
```

#### DISPLAY

```
list customdb [[name] | all | [property]]
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

#### DELETE

```
delete customdb [[name] | all]
```

### DESCRIPTION

You can use the customdb component to define a custom tacdb

### EXAMPLES

```
create customdb new { url file:/shared/images/new.txt }
```

Creates a new custom tacdb, "new" with TAC code information in the file specified by url.

### OPTIONS

#### create

Creates a new custom tacdb.

#### delete

Deletes the custom tacdb that you specify next.

**url** Specifies the url to fetch the file containing the TACDB information.

#### poll-interval

Specifies the time interval in seconds at which the URL needs to be polled. The initial default value 0 disables polling. The literal "default" value is 300 seconds (5 minutes).

#### priority

Specifies the priority whether the customdb is higher or lower than built-in/licensed TACDB.

#### app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

#### description

User defined description for this customdb.

#### partition

Displays the administrative partition within which the component resides.

SEE ALSO

## ltm tacdb licenseddb

NAME  
licenseddb - Configures a licensed tacdb to be used for file loads.

MODULE  
ltm tacdb

SYNTAX  
Configure the licenseddb component within the ltm tacdb module using the syntax in the following sections.

MODIFY  
modify licenseddb [ licensed-tacdb | all]  
options:  
poll-interval [integer]

DISPLAY  
list licenseddb [ licensed-tacdb | all | [property]]  
options:  
all-properties  
non-default-properties  
one-line  
recursive

DESCRIPTION  
You can use the licenseddb component to define polling interval of downloading licensed tacdb

EXAMPLES  
modify licenseddb licensed-tacdb poll-interval 2  
  
Modifies polling interval, "2" means two weeks.

OPTIONS  
poll-interval  
Specifies the time interval in weeks at which the licensed tacdb needs to be polled

SEE ALSO  
edit, list, modify, tmsh

## ltm tacdb query

NAME  
query - Displays the device type and OS to which a TAC code belongs

MODULE  
ltm tacdb

**SYNTAX**  
Use the query component within the ltm tacdb module to query the device type and OS the TAC code belongs to.

**DISPLAY**  
show ltm tacdb query [integer]

**DESCRIPTION**  
You can use the query component to query the device type and OS a url belongs to

**EXAMPLES**  
show ltm tacdb query 35333303  
Displays the device type and OS "35333303" belongs to.

**OPTIONS**  
integer  
Specify the TAC code.

**SEE ALSO**  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.  
F5 Networks and BIG-IP (c) Copyright 2009-2015. All rights reserved.

BIG-IP      2016-03-14      ltm tacdb query(1)

---

## ltm traffic-class

**NAME**  
traffic-class - Configures a traffic class.

**MODULE**  
ltm

**SYNTAX**  
Configure the traffic-class component within the ltm module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create traffic-class [name]  
modify traffic-class [name]  
options:  
  app-service [[string] | none]  
  classification [string]  
  description [string]  
  destination-address [ [ip address] | none]  
  destination-mask [ [ip address] | none]  
  destination-port [ [integer] | [port name] ]  
  protocol [any | [protocol] ]  
  source-address [ [ip address] | none]  
  source-mask [ [ip address] | none]  
  source-port [ [integer] | [port name] ]

edit traffic-class [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line

**DISPLAY**  
list traffic-class  
list traffic-class [ [ [name] | [glob] | [regex] ] ... ]  
show running-config traffic-class  
show running-config traffic-class [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line

**DELETE**  
delete traffic-class [name]

**DESCRIPTION**  
You can use the traffic-class component to configure a traffic class, which is a named group of ports, machines, and subnets. You can then assign this traffic class to a virtual server in order to configure the virtual server to achieve specific Quality of Service (QoS) standards.

**EXAMPLES**  
create traffic-class my\_traffic\_class classification "My traffic class."  
Creates a traffic class named my\_traffic\_class, which tags matching

flows with the tag My traffic class.

list traffic-class all-properties

Displays all of the properties of all of the traffic classes.

delete traffic-class my\_traffic\_class

Deletes the traffic class named my\_traffic\_class.

#### OPTIONS

app-service

Specifies the name of the application service to which the traffic class belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the traffic class. Only the application service can modify or delete the traffic class.

classification

Specifies the actual textual tag to be associated with the flow if the traffic class is matched. This option is required.

description

User defined description.

destination-address

Specifies destination IP addresses for the system to use when evaluating traffic flow. If traffic flow matches this value, it is tagged with the value in the classification option. The default value is none.

destination-mask

Specifies a destination IP address mask for the system to use when evaluating traffic flow. If traffic flow matches this value, it is tagged with the value in the classification option. The default value is none.

destination-port

Specifies a destination port for the system to use when evaluating traffic flow. If traffic flow matches this value, it is tagged with the value in the classification option. The default value is 0 (zero).

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

protocol

Specifies a protocol for the system to use when evaluating traffic flow. If traffic flow matches this value, it is tagged with the value in the classification option. The default value is any.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

source-address

Specifies source IP addresses for the system to use when evaluating traffic flow. If traffic flow matches this value, it is tagged with the value in the classification option. The default value is none.

source-mask

Specifies a source IP address mask for the system to use when evaluating traffic flow. If traffic flow matches this value, it is tagged with the value in the classification option. The default value is none.

source-port

Specifies a source port for the system to use when evaluating traffic flow. If traffic flow matches this value, it is tagged with the value in the classification option. The default value is 0 (zero).

#### SEE ALSO

create, delete, edit, glob, list, ltm virtual, modify, regex, tmsh

## ltm urlcat-cloud-cache

**NAME**  
urlcat-cloud-cache - Operating on the cache of cloud lookup result.

**MODULE**  
ltm

**SYNTAX**  
Use the urlcat-cloud-cache component within the ltm module to operating on the cloud cache.

**DISPLAY**  
delete ltm urlcat-cloud-cache url all

**DESCRIPTION**  
You can use the urlcat-cloud-cache component to operating on the cache.

**EXAMPLES**  
delete ltm urlcat-cloud-cache url all  
Delete all the cache entries currently in cloud cache.

**OPTIONS**  
all Use all to delete all the cache entries currently in cloud cache.

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## ltm urlcat-query

**NAME**  
urlcat-query - Displays the category to which a url belongs

**MODULE**  
ltm

**SYNTAX**  
Use the urlcat-query component within the ltm module to query the category the url belongs to.

**DISPLAY**  
show ltm urlcat-query [string]

**DESCRIPTION**  
You can use the urlcat-query component to query the category a url belongs to

**EXAMPLES**  
show ltm urlcat-query www.google.com  
Displays the category "www.google.com" belongs to.

**OPTIONS**  
string  
Specify the urlname.

**SEE ALSO**  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## ltm virtual-address

**NAME**  
virtual-address - Configures virtual addresses.

**MODULE**  
ltm

**SYNTAX**  
Configure the virtual-address component within the ltm module using the syntax shown in the following sections.

```
CREATE/MODIFY
create virtual address [name]
modify virtual address [name]
options:
  address [ip address]
  app-service [[string] | none]
  arp [enabled | disabled]
  auto-delete [true | false]
  connection-limit [integer]
  description [string]
  enabled [yes | no]
  icmp-echo [enabled | disabled]
  mask [netmask]
  route-advertisement [enabled | disabled]
  server-scope [all | any | none]
  spanning [enabled | disabled]
  traffic-group [[string] | default | non-default | none]
  metadata
    [add | delete | modify] {
[metadata_name ... ] {
  value [ "value content" ]
  persist [ true | false ]
}
}

edit virtual-address [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

reset-stats virtual-address
reset-stats virtual-address [ [ [name] | [glob] | [regex] ] ... ]

mv virtual-address [ [[source-name] [destination-name]] | [[name] to-folder [folder-name]] | [[name...name] to-folder
options:
  to-folder

DISPLAY
list virtual-address
list virtual-address [ [ [name] | [glob] | [regex] ] ... ]
show running-config virtual-address
show running-config virtual-address
  [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

show virtual-address
show virtual-address [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  detail
  field-fmt

DELETE
delete virtual-address [all | [name]]
```

### DESCRIPTION

You can use the virtual-address component to enable, disable, display, and delete virtual addresses. You can also list the virtual address configuration, and view statistics for a specific virtual address.

Note that tmsh only displays virtual addresses when you explicitly request them. For example:

To display the properties of virtual addresses or a specific virtual address from the ltm module, use the command sequences `list virtual-address` and `list virtual-address [name]`, respectively.

To display statistics for virtual addresses or a specific virtual address from the ltm module, use the command sequence `show virtual-address` and `show virtual-address [name]`, respectively.

### EXAMPLES

```
create virtual-address myVirtualAddr address 10.10.10.20 enabled yes
```

Creates a virtual address 10.10.10.20, with a name of myVirtualAddr.

```
create virtual-address myVirtualAddr address 10.10.10.20 enabled yes
traffic-group /Common/traffic-group-1
```

Creates a virtual address 10.10.10.20, with a name of myVirtualAddr, that is assigned to traffic-group-1.

```
modify virtual-address myVirtualAddr enabled no
```

Disables the virtual address myVirtualAddr.

delete virtual-address myVirtualAddr

Deletes the virtual address myVirtualAddr.

list virtual-address myVirtualAddr all-properties

Lists the configuration information for the virtual address, myVirtualAddr.

show virtual-address myVirtualAddr

Displays statistics and status for the virtual-address myVirtualAddr.

show virtual-address myVirtualAddr all-properties

Displays statistics and status for the virtual named myVirtualAddr.

Note that if the system includes Packet Velocity(r) ASIC (PVA) and PVA Assist capabilities, this command displays status and statistics for that feature.

```
mv /ltm virtual-address /Common/10.10.10.20 to-folder
/Common/all_virtual_addresses
```

Moves the virtual-address 10.10.10.20 to a folder named all\_virtual\_addresses.

Note: If you wish to change the name of the virtual-address, you must use the configured IP Address or a name that does not represent a different IP Address than the one configured.

Please refer to the mv manual page for additional examples on how to use the mv command.

#### OPTIONS

address

The virtual IP address.

arp Enables or disables ARP for the specified virtual address. The default value is enabled.

app-service

Specifies the name of the application service to which the virtual address belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the virtual address. Only the application service can modify or delete the virtual address.

auto-delete

Indicates if the virtual address will be deleted automatically on deletion of the last associated virtual server or not. The default value is true.

connection-limit

Sets a concurrent connection limit for one or more virtual servers. The default value is 0, meaning "no limit."

description

User defined description.

enabled

Specifies whether the specified virtual address is enabled. The default value is yes.

floating

Read-only property derived from traffic-group. A floating virtual address is a virtual address for a VLAN that serves as a shared address by all devices of a BIG-IP traffic-group.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

icmp-echo

Enables or disables ICMP echo replies for the specified virtual address. The default value is enabled.

mask Sets the netmask for one or more network virtual servers only. This setting is required for network virtual servers. The default value is 255.255.255.255.

partition

Displays the administrative partition within which the virtual address resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

route advertisement

Enables or disables route advertisement for the specified virtual address. The default value is disabled.

server-scope

Specifies the server that uses the specified virtual address. The default value is any.

spanning

Enables or disables spanning for the specified virtual address. The default value is disabled.

unit Read-only property that specifies the unit in a redundant system.  
Based on traffic-group.

**traffic-group**  
Specifies the traffic group on which the virtual address is active. The default traffic group is inherited from the containing folder.

**inherited-traffic-group**  
Read-only property that indicates if the traffic-group is inherited from the parent folder.

**metadata**  
Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

SEE ALSO

create, delete, edit, glob, list, ltm virtual, modify, mv, regex, reset-stats, show, tmsb

## ltm virtual

**NAME**  
virtual - Configures a virtual server.

**MODULE**  
ltm

**SYNTAX**  
Configure the virtual component within the ltm module using the syntax shown in the following sections.

```
CREATE/MODIFY
create virtual [name]
modify virtual [name]
options:
  all
  address-status [yes | no]
  app-service [[string] | none]
  auth [add | delete | replace-all-with] {
    [profile_name ... ]
  }
  auth [default | none]
  auto-lasthop [default | enabled | disabled ]

```

#### DESCRIPTION

You can use the virtual component to create, delete, modify properties on, and display information about virtual servers. Virtual servers are externally visible IP addresses that receive client requests. Rather than sending the requests directly to the destination IP address specified in the packet header, it sends the requests to any of several content servers that make up a load balancing pool. Virtual servers also apply various behavioral settings to multiple traffic types, enable persistence for multiple traffic types, and direct traffic according to user-written iRules(r).

Note: After you configure a Global Traffic Manager listener, when you use the tab completion feature within the ltm module, the listener displays as one of the virtual servers in the Configuration Items

section.

#### EXAMPLES

```
create virtual myV2 { destination 11.11.11.12:any persist replace-all-with { source_addr } } pool myPool}
```

Creates a virtual server named myV2, which uses the source address persistence method.

```
modify virtual vs_f14_http4 profiles replace-all-with { profile-udp }
```

Replaces the profile associated with the virtual server vs\_f14\_http4.

Note: To replace the profile associated with a virtual server, you must enclose the name of the new profile in curly brackets.

```
delete virtual myV4 myV5 myV6
```

Deletes the virtual servers named myV4, myV5, and myV6.

```
show virtual myV4
```

Displays statistics and status for the virtual named myV4.

```
show virtual myV4 all-properties
```

Displays statistics and status for the virtual named myV4.

Note: If the system includes Packet Velocity(r) ASIC (PVA) and PVA Assist capabilities, this command displays status and statistics for that feature.

```
mv /ltm virtual /Common/my_vip to-folder /Common/some_folder
```

Moves a virtual server named my\_vip to the folder named some\_folder, where some\_folder has already been created under /Common.

Note: Please note that you may not move a virtual server that is associated with CGNAT configuration items, such as LSN pools.

#### OPTIONS

**all** Specifies that you want to modify all of the existing components of the specified type.

**address-status**

Specifies whether the virtual will contribute to the operational status of the associated virtual-address. The default value is 'yes'.

**app-service**

Specifies the name of the application service to which the virtual server belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the virtual server. Only the application service can modify or delete the virtual server.

**auth** Specifies a list of authentication profile names, separated by spaces, that the virtual server uses to manage authentication.

**clone-pools**

Specifies a pool or list of pools that the virtual server uses to replicate either client or server traffic. You must specify a value of either clientside or serverside for the context option for each clone pool. Typically, this option is used for intrusion detection.

**cmp-enabled**

Enables or disables clustered multi-processor (CMP) acceleration. This feature applies to certain platforms only. The default value is yes.

**connection-limit**

Specifies the maximum number of concurrent connections you want to allow for the virtual server. The default value of 0 (zero) allows for an unlimited number of concurrent connections.

**context**

Specifies that the pool is either a clientside or serverside clone pool.

Note: Because validation occurs outside of TMSH, you will receive an error when you modify the context for profiles in a virtual server.

**dhcp-relay**

Specifies a virtual server that relays all received dhcp requests to all pool members. If there is no pool, the received request get dropped. If you specify the dhcp-relay option, you cannot use the ip-forward or l2-forward or reject options.

**description**

User defined description.

**destination**

Specifies the name of the virtual address and service on which the virtual server listens for connections.

The format for "ipv4" is a.b.c.d[:port]. The format for an "ipv6" address is a:b:c:d:e:f:g:h[:port].

The default value is any:any.

(enabled | disabled)

Specifies the state of the virtual server. The default value is

enabled.

Note: When you disable a virtual server, the virtual server no longer accepts new connection requests. However, it allows current connections to finish processing before going to a down state.

#### fallback-persistence

Specifies a fallback persistence profile for the virtual server to use when the default persistence profile is not available. The default value is none.

#### flow-eviction-policy

Specifies a flow eviction policy for the virtual server to use, to select which flows to terminate when the number of connections approaches the connection limit on the virtual server. The default value is none.

#### fw-enforced-policy

Specifies an enforced firewall policy. fw-enforced-policy rules are enforced on a virtual server.

#### fw-enforced-policy-rules

Specifies firewall rules enforced on ltm virtual via referenced fw-enforced-policy.

#### fw-staged-policy

Specifies a staged firewall policy. fw-staged-policy rules are not enforced while all the visibility aspects namely statistics, reporting and logging function as if the fw-staged-policy rules were enforced on a virtual server.

#### fw-staged-policy-rules

Specifies firewall rules staged on ltm virtual via referenced fw-staged-policy.

#### security-nat-rules

Specifies security nat rules associated with ltm virtual via referenced security-nat-policy.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### gtm-score

Specifies a score that is associated with the virtual server. Global Traffic Manager (GTM) can rely on this value to load balance traffic in a proportional manner.

#### traffic-acceleration-status

Displays the current traffic-acceleration status. The virtual server is considered traffic-acceleration-dedicated if it uses a traffic-acceleration profile.

#### http-class

Specifies a list of HTTP class profiles, separated by spaces, with which the virtual server works to increase the speed at which the virtual server processes HTTP requests. The default value is none. The order in which the profiles are entered sets the priority of each profile, in ascending order, specific to this virtual server.

#### ip-forward

Specifies a virtual server that has no pool members to load balance, but instead, forwards the packet directly to the destination IP address specified in the client request. If you specify the ip-forward option, you cannot use the l2-forward or reject options. Internal virtual servers do not receive external connections, instead they are specified by name by profiles in the parent virtual server (see ltm profile request-adapt and ltm profile response-adapt). Since internal virtual servers do not listen for external connections, not all attributes are used for internal virtual servers. The destination, mask, translate-address, translate-port, vlans, vlans-disabled and vlans-enabled attributes are set by the system and any attempt to change them will have no effect.

#### ip-protocol

Specifies the IP protocol for which you want the virtual server to direct traffic. Sample protocol names are TCP and UDP. The default value is any.

Note: You do not use this setting when creating an HTTP class virtual server.

#### internal

Specifies an internal virtual server that handles requests for a parent virtual server, such as content adaptation. Internal virtual servers do not receive external connections, instead they are specified by name by profiles in the parent virtual server (see ltm profile request-adapt and ltm profile response-adapt). Since internal virtual servers do not listen for external connections, not all attributes are used for internal virtual servers. The destination, mask, translate-address, translate-port, vlans, vlans-disabled and vlans-enabled attributes are set by the system, any attempt to change them will have no effect.

#### l2-forward

Specifies a virtual server that shares the same IP address as a node in an associated VLAN. You create this type of virtual server when you want to create a VLAN group. If you specify the l2-forward option, you cannot use the ip-forward or reject options.

#### last-hop-pool

Specifies the name of the last hop pool that you want the virtual server to use to direct reply traffic to the last hop router. The

default value is none.

**mask** Specifies the netmask for a network virtual server only. This setting is required for a network virtual server.

The netmask clarifies whether the host bit is an actual zero or a wildcard representation. The default value is 255.255.255.255 for IPv4 or ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff for IPv6.

**mirror**

Enables or disables mirroring. You can use mirroring to maintain the same state information in the standby unit that is in the active unit, allowing transactions such as FTP file transfers to continue as though uninterrupted. The default value is none.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**nat64**

Enable or disable NAT64. The default value is disabled. NAT64 is a service that automatically translate IPv6 traffic into IPv4.

**partition**

Displays the name of the administrative partition within which the virtual server resides.

**persist**

Specifies a list of profiles separated by spaces that the virtual server uses to manage connection persistence. The default value is none.

To enable persistence, typically you specify a single profile. However, you can specify multiple profiles in conjunction with `iRules(r)` that define a persistence strategy based on incoming traffic. In the case of multiple profiles, the default option specifies which profile you want the virtual server to use if an `iRule` does not specify a persistence method. When you specify multiple profiles, the default value of the default property is no. You can set the value of the default property to yes for only one of the profiles.

**pool** Specifies a default pool to which you want the virtual server to automatically direct traffic. The default value is none.

**port-misuse**

Used to show or reset port misuse policy statistics for the virtual server.

**profiles**

Specifies a list of profiles for the virtual server to use to direct and manage traffic. The default value is fastL4.

**rate-class**

Specifies the name of an existing rate class that you want the virtual server to use to enforce a throughput policy for incoming network traffic. The default value is none.

**rate-limit**

Specifies the maximum number of connections per second allowed for a virtual server. The default value is 'disabled'.

**rate-limit-mode**

Indicates whether the rate limit is applied per virtual object, per source address, per destination address, or some combination thereof. The default value is 'object', which does not use the source or destination address as part of the key.

**rate-limit-dst-mask**

Specifies a mask, in bits, to be applied to the destination address as part of the rate limiting. The default value is '0', which is equivalent to using the entire address - '32' in IPv4, or '128' in IPv6.

**rate-limit-src-mask**

Specifies a mask, in bits, to be applied to the source address as part of the rate limiting. The default value is '0', which is equivalent to using the entire address - '32' in IPv4, or '128' in IPv6.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**related-rules**

Specifies a list of `iRules`, separated by spaces, that customize the behavior of secondary channels (for instance the data channel on FTP) opened on behalf of the virtual server. The default value is none.

**reject**

Specifies that the BIG-IP(r) system rejects any traffic destined for the virtual server IP address. If you specify the reject option, you cannot use the `ip-forward` or `l2-forward` options.

**rules**

Specifies a list of `iRules`, separated by spaces, that customize the virtual server to direct and manage traffic. The default value is none.

**security-nat-policy**

Configures the following options to specify which Security NAT Policy is to be used to match the incoming traffic and perform

source/destination translation (address/port) using the first-match rule criteria:

**policy**

Specifies the name of the Security NAT Policy to be used (see security nat policy).

**use-route-domain-policy**

Specifies whether to use the virtual server's route domain context's Security NAT policy. If enabled AND the virtual server does not have a NAT policy configured, route domain's security NAT policy is used.

**use-device-policy**

Specifies whether to use the security device context NAT policy (see security device-context). If enabled AND both virtual server as well as route domain do not have a NAT policy configured, NAT policy configured at security device (a.k.a global) level is used.

**service-down-immediate-action**

Specifies the immediate action the BIG-IP system should respond with upon the receipt of the initial client's SYN packet if the availability status of the virtual server is Offline or Unavailable. This is supported for the virtual server of Standard type and TCP protocol. The default value is none.

**service-policy**

Specifies a service policy for the virtual server. If set, it will enforce the service policy for incoming network traffic. The service policy can be used to validate if incoming traffic conforms to a set of application protocols.

**snat** Specifies whether SNAT automap is enabled for the virtual server. The default value is none. This attribute is DEPRECATED. Use source-address-translation { type ( automap / none ) }

**snatpool**

Specifies the name of an existing SNAT pool that you want the virtual server to use to implement selective and intelligent SNATs. This attribute is DEPRECATED. Use source-address-translation { type snatpool pool pool\_name }

**source**

Specifies an IP address or network from which the virtual server will accept traffic.

The format for an "ipv4" address is a.b.c.d[/prefixlen]. The format for an "ipv6" address is a:b:c:d:e:f:g:h[/prefixlen].

**source-address-translation**

Specifies the type of source address translation enabled for the virtual server as well as the pool that the source address translation will use.

**pool** Specifies the name of a LSN or SNAT pool used by the specified virtual server.

**type** Specifies the type of source address translation associated with the specified virtual server.

The options are:

**automap**

Specifies the use of self IP addresses for virtual server source address translation.

**lsn** Specifies the use of a LSN pool of translation addresses for virtual server source address translation.

**none** Specifies no source address translation to be used by the virtual server.

**snat** Specifies the use of a SNAT pool of translation addresses for virtual server source address translation.

**source-port**

Specifies whether the system preserves the source port of the connection. The default value is preserve.

The options are:

**change**

Obfuscates internal network addresses.

**preserve**

Preserves the source port of the connection.

**preserve-strict**

Use this value only for UDP under very special circumstances, such as nPath or transparent (that is, no translation of any other L3/L4 field), where there is a 1:1 relationship between virtual IP addresses and node addresses, or when clustered multi-processing (CMP) is disabled.

**traffic-classes**

Specifies a list of traffic classes that are associated with the virtual server. The default value is none.

**translate-address**

Enables or disables address translation for the virtual server. Disable address translation for a virtual server if you want to use the virtual server to load balance connections to any address. This option is useful when the system is load balancing devices

that have the same IP address. The default value is disabled.

**translate-port**  
Enables or disables port translation. Disable port translation for a virtual server, if you want to use the virtual server to load balance connections to any service. The default value is disabled.

**transparent-nexthop**  
Specifies the egress interface for traffic and enables layer 2 (MAC) address preservation. Layer 2 address preservation disables layer 3 (IP/IPv6) address translation.

**vlan**  
Specifies a list of VLANs on which the virtual server is either enabled or disabled. The default value is none. The options `vlan-disabled` and `vlan-enabled` indicate whether the virtual server is disabled or enabled on the list of specified VLANs.

**vlan-disabled**  
Disables the virtual server on the VLANs specified in the `vlan` option. This is the default setting.

**vlan-enabled**  
Enables the virtual server on the VLANs specified in the `vlan` option.

**vs-index**  
Displays a unique index assigned to this virtual server.

**metadata**  
Associates user defined data, each of which has name and value pair and persistence. Persistent(default) means the data will be saved into config file.

**ip-intelligence-categories**  
Used to show/ reset statistics on IP intelligence white/ black lists categories.

## net

### net arp

**NAME**  
arp - Manages entries in the Address Resolution Protocol (ARP) table.

**MODULE**  
net

**SYNTAX**  
Configure the arp component within the net module using the syntax in the following sections.

**CREATE/MODIFY**  
`create arp [name]`  
options:  
description [string]  
ip-address [ip address ... ip address]  
mac-address [mac address]

`modify arp [name]`  
options:  
description [string]  
mac-address [mac address]

`edit arp [ [name] | [glob] | [regex] ] ... ]`  
options:  
all-properties  
non-default-properties

**DISPLAY**  
`list arp`  
`list arp [ [name] | [glob] | [regex] ] ... ]`

```
show running-config arp
show running-config arp
  [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line

show arp
show arp [ [name] | [glob] | [regex] ] ... ]
options:
  (dynamic | static)
```

```
DELETE
delete arp [name]
```

#### DESCRIPTION

You can use the arp component to add entries to or delete entries from the ARP table.

You can create static ARP entries for IPv4 addresses to link-layer addresses, such as Ethernet media access control (MAC) addresses. You can view and delete static and dynamic ARP entries.

Note that you can use the db component in the sys module to configure how the system handles ARP entries for dynamic timeout, maximum dynamic entries, add reciprocal, and maximum retries. For more information, see sys db.

#### EXAMPLES

```
create arp myARP ip-address 10.10.10.20 mac-address 00:0b:09:88:00:9a
```

Creates an arp mapping of the IP address 10.10.10.20 to the MAC address 00:0b:09:88:00:9a, and the name of this entry is myARP. Alternatively, the address can be used as the name, like the following example.

```
create arp 10.10.10.20 mac-address 00:0b:09::88:00:9a
```

Creates an arp mapping of IP address 10.10.10.20 to the MAC address 00:0b:09:88:00:9a.

```
modify arp 10.10.10.20 mac-address 00:0b:09:88:00:9b
```

Modifies the ARP mapping of the ARP entry named 10.10.10.20 to the MAC address 00:0b:09:88:00:9b.

```
show arp
```

Displays ARP status and statistics for the system.

```
show arp any%2
```

Displays ARP status and statistics for all IP addresses in route domain 2. A glob expression displays the same result: show arp \*%2.

```
list arp all-properties
```

Displays all properties for all ARP entries for the system.

```
list arp non-default-properties
```

Displays all non-default properties for all ARP entries for the system.

```
delete arp all
```

Deletes all ARP entries for the system.

```
delete arp myARP
```

Deletes the ARP entry named myARP.

#### OPTIONS

**description**  
User defined description.

**dynamic**  
Displays the status of dynamic ARP entries.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**ip address**  
Specifies the IP address, in one of the following formats, for which you want to configure an ARP entry:

IPv4 address in dotted-quad notation, for example, 10.10.10.1  
host name, for example, www.f5.com

You can also specify a list of IP addresses separated by a single space. For example, this list contains three IP addresses:  
10.10.10.20 10.10.10.21 10.10.10.22.

**ip-address**  
The IP address to be mapped. This is optional, and if not present, the name needs to be a string that represents a valid IP address.

**mac-address**  
Specifies a 6-byte ethernet address in not case-sensitive hexadecimal colon notation, for example, 00:0b:09:88:00:9a. You must specify a MAC address when you create an ARP entry.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression])

to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

static  
Displays the status of static ARP entries.

SEE ALSO  
create, delete, edit, glob, list, modify, regex, show, tmsh

## net bwc policy

NAME  
policy - Configures a bandwidth control policy for traffic flow.

MODULE  
net bwc

SYNTAX  
Configure the policy component within the net bwc module using the syntax in the following sections.

CREATE/MODIFY  
create policy [name]  
modify policy [name]  
options:  
app-service [[string] | none]  
description [string]  
dynamic [ enabled ]  
max-rate [integer]  
max-user-rate [integer]  
max-user-rate-pps [integer]  
ip-tos [ integer | pass-through]  
link-qos [integer | pass-through]  
measure [ disabled ]  
log-publisher [[string] | none]  
log-period [integer]  
categories [none] {  
max-cat-rate [integer]  
max-cat-rate-percentage [integer]  
ip-tos [ integer | pass-through]  
link-qos [integer | pass-through]  
traffic-priority-map [string]  
}  
traffic-priority-map [string]  
edit policy [ [ name ] | [ glob ] | [ regex ] ] ... ]  
options:  
all-properties  
non-default-properties  
DISPLAY  
list policy  
list policy [ [ name ] | [ glob ] | [ regex ] ] ... ]  
show running-config net policy  
show running-config net policy [ [ name ] | [ glob ] | [ regex ] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
DELETE  
delete net policy [all | [name] ]

DESCRIPTION  
You can use the net bwc policy to create a bandwidth control policy to handle traffic flow, and then associate it with other components such as packet filter, iRule and virtual server. For details on packet filter, virtual server, please refer to the respective documentation.

EXAMPLES  
create net bwc policy  
Creates a bwc policy (see below).  
list net bwc policy all-properties  
Displays all of the properties of all of the bwc policies.  
delete net bwc policy

Deletes a policy (see below).

Example for static policy:

```
net bwc policy silver_static_policy {
    max-rate 120mbps
}
```

Example for dynamic policy:

```
net bwc policy gold-dynamic-policy {
    categories {
        web {
            description "This is a web test category."
            max-cat-rate 600kbps
            ip-tos 7
            link-qos 5
        }
    }
    description "This is a test."
    dynamic enabled
    max-rate 40gbps
    max-user-rate 1gbps
}
```

Example for dynamic policy with measure enabled:

```
net bwc policy gold-dynamic-policy {
    categories {
        web {
            description "This is a web test category."
            max-cat-rate 600kbps
            ip-tos 7
            link-qos 5
        }
    }
    description "This is a test."
    dynamic enabled
    measure enabled
    log_publisher /Common/my_log_publisher
    log-period 2048
    max-rate 40gbps
    max-user-rate 1gbps
}
```

Example for BWC using packet filter:

```
net bwc policy bwc {
    max-rate 1mbps
}
```

Define packet filter with bwc on it:

```
net packet-filter pfilter {
    action continue
    bwc policy bwc
    logging enabled
    order 2
    rule ip
}
```

Example for BWC association with virtual server:

```
ltm virtual l2-for-virtual {
    destination 0.0.0.0:any
    l2-forward
    mask any
    profiles {
        fastL4 { }
    }
    rules {
        bwc_test
    }
    translate-address disabled
    translate-port disabled
    vlans {
        lan
        wan
    }
    vlans-enabled
}
ltm virtual tcp-passthrough {
    destination 0.0.0.0:http
    ip-protocol tcp
    mask any
    profiles {
        tcp { }
    }
    rules {
        bwc_test
    }
    translate-address disabled
    vlans-disabled
}
```

Example for Delete bwc policy:

```
net bwc policy silver_static_policy
```

Example for bwc policy traffic map:

```
net bwc policy bwc-policy-105 {
    categories {
```

```

    cat1 {
max-cat-rate 10mbps
traffic-priority-map tcl->cat1
    }
    cat2 {
max-cat-rate 10mbps
traffic-priority-map tcl->cat2
    }
}
dynamic enabled
max-rate 100mbps
max-user-rate 10mbps
}

```

Notes: Only static policies are supported for association with packet filter or virtual server components.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**name** Specifies a unique name for the policy. This option is required for the commands create, delete, and modify.

##### description

User defined description.

##### max-rate

Specifies the maximum bandwidth that traffic is allowed using the policy associated. The range is from 1Mbps to 320Gbps.

Valid units: bps(default), gbps, kbps, mbps.

##### max-user-rate

Specifies the maximum bandwidth that traffic is allowed using the policy associated. The range is from 5kbps to 2Gbps.

Valid units: bps(default), gbps, kbps, mbps.

##### max-user-rate-pps

Specifies the limiter in packets per second that traffic is allowed using the associated policy. This does not allocate any fairshare bandwidth. When configured this acts purely as a simple packet limiter. It is packet size and protocol agnostic. It can be configured only on a dynamic policy. When configured along with mbps values, whichever lower limit pps vs mbps is applied. When configured, both need to pass for packets to go through. The default value is 0 (not configured).

##### traffic-priority-map

Specifies the bwc priority-group to use during congestion. This is optional and to be configured only as needed. A bwc priority-group can be shared and amongst categories of the same bwc policy but not across bwc policies. When configured on policy or category, the max-user-rate or max-cat-rate as configured would be additionally applied. Thus the lower of all values for max. rates would take effect.

##### max-cat-rate

Specifies the maximum bandwidth that traffic is allowed using this category with associated policy. The range is from 500Kbps to max-user-rate.

Valid units: bps(default), gbps, kbps, mbps.

##### max-cat-rate-percentage

Specifies the maximum bandwidth as percentage of that traffic is allowed using this category with associated policy. The range is from 1 to 100.

##### dynamic

Specifies the type for policy to be dynamic type. This option is optional for the commands create, delete, and modify. The default valid is disabled. When dynamic is disabled, the policy type is said to be static, where the maximum rate is enforced for combined traffic using the policy and no fairness bandwidth guarantee for each of the traffic respectively. The default value is: disabled. Note: policy type change modification is a disallowed configuration.

By enabling this option, the policy is dynamic type and requires you to configure max-user-rate-range. This type of policy enforces fairness for all the traffic associated with the policy and also for each traffic within the policy.

##### ip-tos

Specifies an IP ToS number for the traffic using the net bwc policy. This option specifies the ToS level that the traffic management system assigns to UDP packets when sending them. The default value is pass-through, which indicates, do not modify UDP packets. The valid range for IP ToS value that can be specified is 0 to 63.

Note: If this is specified, bandwidth policy is not enforced. The packets are just marked for a downstream system to process.

##### link-qos

Specifies a Link QoS (VLAN priority) for the traffic using the net bwc policy. This option specifies the QoS level that the system assigns to UDP packets when sending. The default value is pass-

through, which indicates, do not modify UDP packets. The valid range for QoS value is 0 to 7.

Note: If this is specified, bandwidth policy is not enforced. The packets are just marked for a downstream system to process.

#### measure

Enables or disables bandwidth measurement on all the future instances of bwc policy. Users can override this setting using iRules. If enabling measurement on all instances is not desired then users can keep this setting disabled and use iRules to enable measurement on specific instances of bwc policy.

#### log\_publisher

Specifies the name of the log publisher configured in the system. Bandwidth measurement results will be sent to this log publisher.

#### log\_period

Time interval in milliseconds representing the frequency of generation of bandwidth measurement logs.

#### categories

This specifies the categories under policy. Note: policy need to be enabled as dynamic to configure categories. Up to a maximum of 32 categories can be configured. All the categories under the dynamic policy share the bandwidth as specified for the category, up to a maximum of max-user-rate. Specify the maximum bandwidth for the category of traffic using max-cat-rate or by max-cat-rate-percentage as a percentage of the maximum user rate. Either only the range or absolute value is required.

Example to configure a dynamic bandwidth policy category using tmsh:

```
root@(localhost)(cfg-sync
Standalone)(Active)(/Common)(tmsh.net.bwc policy.gold-dynamic-policy)# categories add { web { max-cat-rate 600kbps
net bwc policy gold-dynamic-policy {
categories {
web {
max-cat-rate 600kbps
}
}
dynamic enabled
max-rate 40gbps
max-user-rate 1gbps
}
}
```

The parameters for dynamic policy and categories:

```
net bwc policy test-policy {
app-service none
categories {
web {
app-service none
description "This is a web test cat"
max-cat-rate 600kbps
max-cat-rate-percentage 0
ip-tos 6
}
}
description "This is a test"
dynamic enabled
ip-tos pass-through
link-qos pass-through
max-rate 40gbps
max-user-rate 1gbps
measure enabled
log-publisher /Common/my_log_publisher
log-period 2048
partition Common
}
```

#### max-cat-rate-percentage

Specifies the percentage of the value of the max-cat-rate option of the category, which is associated with the net bwc policy component to which this shaping policy is associated, that is available for this traffic flow. The value range is from 500kbps to max-user-rate.

#### Few Examples using iRule:

Please refer to iRule documentation for complete list of bwc commands. Below are few examples and do not cover all cases.

Example to associate static bwc policy using iRule:

```
when CLIENT_ACCEPTED {
BWC::policy attach silver_static_policy
}
```

Example to associate dynamic bwc policy using iRule:

```
when CLIENT_ACCEPTED {
set mycookie [IP::remote_addr]
BWC::policy attach gold-dynamic-policy $mycookie
}
```

Example for bwc policy to mark traffic flows using iRule:

```
BWC::mark > >
```

So to assign a policy, color, and mark here is an example rule

```
when CLIENT_ACCEPTED {
```

```

set mycookie [IP::remote_addr]:[TCP::remote_port]
BWC::policy attach gold_user $mycookie
BWC::color set gold_user p2p
BWC::mark set gold_user tos 8 qos 4
}

```

Example for using bwc policy category to color a flow using iRule:

After a flow has been assigned a policy, at some later time when the traffic is classified the user can assign an application to this flow. This uses the bwc config to create a bwc policy with the categories keyword: for example, p2p category below:

```

tmsh create net bwc policy gold_user categories add { p2p { max-cat-
rate 8mbps } } max-rate 10mbps max-user-rate 10mbps dynamic enabled

```

The rule args

```
BWC::color
```

So to assign a policy and color here is an example rule

```

when CLIENT_ACCEPTED {
set mycookie [IP::remote_addr]:[TCP::remote_port]
BWC::policy attach gold_user $mycookie
BWC::color set gold_user p2p
}

```

Example for bwc policy rate change using iRule:

After a policy is created, irule can modify the rate for a session or category

The rule args

```
BWC::rate
```

```
BWC::rate
```

So to modify the rate

```

when CLIENT_ACCEPTED {
set mycookie [IP::remote_addr]:[TCP::remote_port]
BWC::policy attach gold_user $mycookie
BWC::color set gold_user p2p
BWC::mark set gold_user tos 8 qos 4
BWC::rate $mycookie p2p 1000000bps
}

```

Example for bwc policy to measure the bandwidth using iRule:

```

BWC::measure << | | >
[session_str]>

```

To start the bandwidth measurement for BWC policy

```

when CLIENT_ACCEPTED {
set mycookie [IP::remote_addr]:[TCP::remote_port]
BWC::policy attach gold_user $mycookie
BWC::measure start session
}

```

The above iRule will start the measurement of bandwidth on the gold user policy instance. The results will be published to the destination specified in the log\_publisher setting for the gold\_user bwc policy. The measurement results will be logged every 'log\_period' amount of time, which is also specified in the policy settings for gold\_user.

Note: Attaching a BWC policy is a pre-requisite for all 'BWC::measure.' iRules. Failing to do so will result in the iRule execution failure which in turn will abort the connection.

To start the bandwidth measurement for a flow inside a BWC policy and tag the results.

```

when CLIENT_ACCEPTED {
set mycookie [IP::remote_addr]:[TCP::remote_port]
BWC::policy attach gold_user $mycookie
BWC::measure identifier MYFLOW flow
BWC::measure start flow
}

```

The above iRule will start the measurement of bandwidth on the current flow or the flow over which the current iRule is running. The results will be published to the destination specified in the log\_publisher setting for the gold\_user bwc policy. The measurement results will be logged every 'log\_period' amount of time, which is also specified in the policy settings for gold user. Every log message containing the bandwidth result will carry the tag 'MYFLOW'. This helps identify different types of bandwidth results when analyzing the bandwidth measurement results.

To start the bandwidth measurement for a BWC session and get the periodic results.

```

when CLIENT_ACCEPTED {
set mycookie [IP::remote_addr]:[TCP::remote_port]
set measureID "MYSESSION"
BWC::policy attach gold_user $mycookie
BWC::measure identifier $measureID session
BWC::measure start session
}

```

```

when SERVER_CONNECTED {
  TCP::collect
  set count 0
}

when SERVER_DATA {
  if {$count >= 1000 } {
    set rate [BWC::measure get rate session]
    set bytes [BWC::measure get bytes session]

    log local0. "Rate $rate/sec : Bytes $bytes : for address $mycookie"
    set count 0
  }
  TCP::release
  TCP::collect
  incr count
}

```

The above example creates an instance of BWC policy gold user and enables measurement on it upon the iRule event CLIENT\_ACCEPTED. It also starts collecting so that it keeps getting notified upon the data arrival. For every 1000 packets a measurement of bandwidth is logged. This is an example that illustrates how to measure bandwidth periodically using iRules. Note that the bandwidth measurement results are still sent to configured log\_publisher at every log\_period interval.

An example log message that is sent to a log publisher.

```

Apr  2 16:29:04 MYSESSION BWC Measurement: Moving average - 539277
bytes/sec. Total bytes - 7305051

```

Example for bwc policy using pps:

```
BWC::pps
```

```

when CLIENT_ACCEPTED {
  set mycookie [IP::remote_addr]:[TCP::remote_port]
  BWC::policy attach gold_user $mycookie
  BWC::pps 100
}

```

## net bwc priority-group

#### NAME

priority-group - Configures a bandwidth control policy for traffic flow.

#### MODULE

net bwc

#### SYNTAX

Configure the priority-group component within the net bwc module using the syntax in the following sections.

##### CREATE/MODIFY

```

create priority-group [name]
modify priority-group [name]
options:
  app-service [[string] | none]
  description [string]
  priority-classes [none] {
    description [string]
    weight-percentage [integer]
  }
}

```

```

edit priority-group [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

```

##### DISPLAY

```

list priority-group
list priority-group [ [name] | [glob] | [regex] ] ... ]
show running-config net bwc priority-group
show running-config net bwc priority-group [ [name] | [glob] | [regex] ] ... ]
options:

```

all-properties  
non-default-properties  
one-line

#### DELETE

```
delete net bwc priority-group [all | [name] ]
```

#### DESCRIPTION

You can use the net bwc priority-group to create a bandwidth traffic group policy to handle traffic flow, and then associate it with bwc component such as bwc policy/category.

#### EXAMPLES

```
create net bwc priority-group
```

Creates a bwc policy (see below).

```
list net bwc priority-group all-properties
```

Displays all of the properties of all of the bwc policies.

```
delete net bwc priority-group
```

Deletes a bwc traffic group (see below).

Example for dynamic policy:

```
net bwc priority-group tc-GOLD {  
  priority-classes {  
    tc-BLUE {  
      weight-percentage 30  
    }  
    tc-RED {  
      weight-percentage 20  
    }  
  }  
}
```

#### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

name Specifies a unique name for the policy. This option is required for the commands create, delete, and modify.

#### description

User defined description.

#### weight-percentage

Specifies the percentage of maximum bandwidth that traffic is allowed during congestion using the traffic class associated. The valid range is 5-100.

#### iRule

Please refer to iRule documentation for iRule to use bandwidth control policy.

#### SEE ALSO

create, delete, edit, glob, list, modify, regex, show, tmsh

## net bwc traffic-group

#### NAME

traffic-group - Configures a bandwidth control policy for traffic flow.

#### MODULE

net bwc

#### SYNTAX

Configure the traffic-group component within the net bwc module using the syntax in the following sections.

#### CREATE/MODIFY

```
create traffic-group [name]  
modify traffic-group [name]  
options:  
  app-service [[string] | none]
```

```

description [string]
dynamic [ enabled ]
priority-classes [none] {
    weight-percentage [integer]
}

edit traffic-group [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
    all-properties
    non-default-properties

DISPLAY
list traffic-group
list traffic-group [ [ name ] | [ glob ] | [ regex ] ] ... ]
show running-config net bwc traffic-group
show running-config net bwc traffic-group [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
    all-properties
    non-default-properties
    one-line

DELETE
delete net bwc traffic-group [all | [name] ]

```

#### DESCRIPTION

You can use the net bwc traffic-group to create a bandwidth traffic group policy to handle traffic flow, and then associate it with bwc component such as bwc policy/category.

#### EXAMPLES

```

create net bwc traffic-group

Creates a bwc policy (see below).

list net bwc traffic-group all-properties

Displays all of the properties of all of the bwc policies.

delete net bwc traffic-group

Deletes a bwc traffic group (see below).

Example for dynamic policy:

```

```

net bwc traffic-group tc-GOLD {
    priority-classes {
        tc-BLUE {
            weight-percentage 30
        }
        tc-RED {
            weight-percentage 20
        }
    }
}

```

#### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

name Specifies a unique name for the policy. This option is required for the commands create, delete, and modify.

#### description

User defined description.

#### weight-percentage

Specifies the maximum bandwidth that traffic is allowed during congestion using the traffic class associated. The range is from 1Mbps to 320Gbps.

Valid units: bps(default), gbps, kbps, mbps.

#### dynamic

Specifies the type for traffic group to be dynamic type. This option is optional for the commands create, delete, and modify. The default valid is disabled. When dynamic is disabled, the traffic group type is said to be static. The type of traffic group should match with be bwc policy that would be mapped. Note: policy type change modification is a disallowed configuration.

#### iRule

Please refer to iRule documentation for iRule to use bandwidth control policy.

#### SEE ALSO

create, delete, edit, glob, list, modify, regex, show, tmsh

## net clone-stats

**NAME**  
clone-stats - Display and Reset Clone Statistics.

**MODULE**  
net

**SYNTAX**  
Display and Reset the clone-stats component within the net module using the syntax in the following section.

**MODIFY**  
reset-stats clone-stats

**DISPLAY**  
show clone-stats  
options:  
(default | field-fmt)

**DESCRIPTION**  
You can use the clone-stats component to display and reset clone statistics. This will help to debug the clone feature.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
reset-stats, show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## net cmetrics

**NAME**  
cmetrics - Displays and deletes entries in the route metrics table on the BIG-IP(r) system.

**MODULE**  
net

**SYNTAX**  
Use the cmetrics component within the net module to view route metrics or delete a route metric entry using the following syntax.

**DISPLAY**  
show cmetrics  
option:  
bandwidth  
dest-addr [ip address]  
hwaddress  
mtu  
rtt  
rttvar  
ssthresh  
tmm

**DELETE**  
delete cmetrics  
option:  
dest-addr [IP address]

**DESCRIPTION**  
You can use the cmetrics component to display entries in the route metrics table on the BIG-IP system. Additionally, you can delete a specified route metric entry from the table. The options are display-only values and cannot be used for filtering.

Note: You can delete only entries that have no connection references.

## EXAMPLES

```
show cmetrics
```

Displays all the entries in the route metrics table.

```
delete cmetrics dest-addr 10.10.1.11
```

Deletes the entry with destination IP address 10.10.1.11 from the route metrics table.

## OPTIONS

```
bandwidth
```

Displays the size of the channel in kbps. Computed as cwnd/rtt.

```
dest-addr
```

Specifies the destination IP address of the entry that you want to display or delete. You can enter this address in either IPv4 or IPv6 format.

```
hwaddress
```

Displays the Media Access Control (MAC) address for the route.

```
mtu Displays the maximum transmit unit size (in bytes) on the route.
```

```
rtt Displays the round-trip time on the route in units of 100ns.
```

```
rttvar
```

Displays the variation in the round-trip time in units of 100ns.

```
ssthresh
```

Displays the cached slow-start threshold in bytes.

```
tmm Displays the identifying number of the tmm (Traffic Management Microkernel).
```

## SEE ALSO

```
delete, show, tmsh
```

## COPYRIGHT

## net cos global-settings

### NAME

global-settings - Configures the global configuration for class of service (CoS).

### MODULE

net cos

### SYNTAX

Modify the global-settings component within the net cos module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
modify global-settings
```

```
options:
```

```
feature-enabled
```

```
feature-disabled
```

```
precedence [dscp-only, 8021p-only]
```

```
default-map-dscp
```

```
[add | delete | modify | replace-all-with] {  
[map-dscp-name] ...
```

```
}
```

```
default-map-8021p
```

```
[add | delete | modify | replace-all-with] {  
[map-8021p-name] ...
```

```
}
```

```
default-traffic-priority [ traffic-priority-name ]
```

#### DISPLAY

```
list global-settings
```

```
options:
```

```
all-properties
```

```
non-default-properties
```

```
one-line
```

```
show global-settings
```

### DESCRIPTION

You can use the global-settings component to configure and view information about the global settings of all CoS behavior.

show keyword displays an analysis of the relative weights of the associated traffic-priority objects.

#### EXAMPLES

```
modify global-settings default-traffic-priority NORMAL_PRIORITY
```

Replace the default traffic-priority with traffic-priority NORMAL\_PRIORITY.

```
modify global-settings default-map-8021p add { VOIP }
```

Add the VOIP 802.1p mapping. The VOIP object specifies the 802.1p field value and associated traffic priority.

#### OPTIONS

**feature-enabled**  
Enable 8 hardware egress CoS queue feature.

**feature-disabled**  
Disable 8 hardware egress CoS queue feature.

**precedence**  
Specifies the precedence between handling of DSCP and 802.1p. Currently, provided options are dscp-only and 8021p-only.

**default-map-dscp**  
Enables adding and removal of mappings between DSCP field values and traffic priorities. See net cos traffic-priority and net cos map-dscp.

**default-map-8021p**  
Enables adding and removal of mappings between 802.1p field values and traffic priorities.

**default-traffic-priority**  
Specifies the default traffic-priority which is applied to all traffic that does not match a specified DSCP/802.1p field value. This allows the user to specify only the mappings which do not match the default.

#### SEE ALSO

net cos traffic-priority, net cos map-dscp

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008-2013, 2016. All rights reserved.

BIG-IP 2016-03-14 net cos global-settings(1)

---

## net cos map-8021p

#### NAME

map-8021p - Configures vlan 8021.p tag to traffic priority mapping.

#### MODULE

net cos

#### SYNTAX

Modify the map-8021p component within the net cos module using the syntax shown in the following sections.

```
CREATE/MODIFY
create map-8021p [name]
modify map-8021p [name]
options:
value [0..7]
traffic-priority [name]
```

```
edit map-8021p [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties
```

```
DISPLAY
list map-8021p
list map-8021p [ [name] | [glob] | [regex] ] ... ]
```

```
show map-8021p
show map-8021p [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
field-fmt
```

#### DELETE

```
delete map-8021p [name]
```

#### DESCRIPTION

The map-8021p object allows users to associate 802.1p field values to relative traffic priority. These objects are associated with active system configuration via net cos global-settings.

#### EXAMPLES

```
create map-8021p VOIP value 4 traffic-priority HIGH_PRIORITY
```

Create the map-8021p named VOIP that associates 802.1p value 4 traffic with traffic-priority named HIGH\_PRIORITY.

```
delete map-8021p VOIP
```

Delete the map-8021p named VOIP.

#### OPTIONS

value  
Specifies the 802.1p field value.

traffic-priority  
Specifies the traffic-priority object associated with traffic matching value.

#### SEE ALSO

create, delete, edit, glob, list, net cos global-settings, modify, net cos traffic-priority, net cos map-dscp, regex, show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008-2013. All rights reserved.

```
BIG-IP      2013-07-01    net cos map-8021p(1)
```

---

## net cos map-dscp

#### NAME

map-dscp - Configures IP DSCP field to traffic priority mapping.

#### MODULE

net cos

#### SYNTAX

Modify the map-dscp component within the net cos module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create map-dscp [name]
modify map-dscp [name]
  options:
    value [0..7]
    traffic-priority [name]
```

```
edit map-dscp [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
```

##### DISPLAY

```
list map-dscp
list map-dscp [ [ [name] | [glob] | [regex] ] ... ]
```

##### show map-dscp

```
show map-dscp [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    field-fmt
```

##### DELETE

```
delete map-dscp [name]
```

#### DESCRIPTION

The map-dscp object allows users to associate DSCP field values to relative traffic priority. These objects are associated with active system configuration via net cos global-settings.

#### EXAMPLES

```
create map-dscp VOIP value 4 traffic-priority HIGH_PRIORITY
```

Create the map-dscp named VOIP that associates DSCP value 4 traffic with traffic-priority named HIGH\_PRIORITY.

```
delete map-dscp VOIP
```

Delete the map-dscp named VOIP.

#### OPTIONS

value  
Specifies the DSCP field value.

traffic-priority  
Specifies the traffic-priority object associated with traffic matching value.

#### SEE ALSO

create, delete, edit, glob, list, net cos global-settings, modify, net cos traffic-priority, net cos map-dscp, regex, show, tms

#### COPYRIGHT

## net cos traffic-priority

#### NAME

traffic-priority - Configures a traffic priority object.

#### MODULE

net cos

#### SYNTAX

Modify the traffic-priority component within the net cos module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create traffic-priority [name]
modify traffic-priority [name]
```

##### options:

```
weight [1..127]
buffer [1..127]
```

```
edit traffic-priority [ [ [name] | [glob] | [regex] ] ... ]
```

##### options:

```
all-properties
non-default-properties
```

##### DISPLAY

```
list traffic-priority
list traffic-priority [ [ [name] | [glob] | [regex] ] ... ]
```

```
show traffic-priority
```

```
show traffic-priority [ [ [name] | [glob] | [regex] ] ... ]
```

##### options:

```
all-properties
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
field-fmt
```

##### DELETE

```
delete traffic-priority [name]
```

#### DESCRIPTION

The traffic-priority object allows users to assign relative scheduling and buffer weightings. These objects are associated to specific traffic with net cos map-dscp and net cos map-8021p. There can be at most 8 traffic-priorities defined in the system. The DEFAULT\_PRIORITY priority may be deleted or modified as desired.

#### EXAMPLES

```
create traffic-priority HIGH_PRIORITY weight 127
```

Create the traffic-priority HIGH\_PRIORITY that has a weight of 127.

```
delete traffic-priority HIGH_PRIORITY
```

Delete the traffic-priority named HIGH\_PRIORITY.

#### OPTIONS

##### weight

Specifies the egress buffer weight. This value is used relative to other egress traffic-priority objects typical of weighted round-robin behavior.

##### buffer

Specifies the relative buffer weight where available egress buffer space is distributed with consistent relative weight.

#### SEE ALSO

create, delete, edit, glob, list, net cos global-settings, modify, net

cos map-dscp, net cos map-8021p, regex, show, tmsh

## net dag-globals

**NAME**

dag-globals - configure global disaggregation settings.

**MODULE**

net

**SYNTAX**

Configure the dag-globals component within the net module using the syntax shown in the following sections.

**MODIFY**

modify dag-globals

options:

round-robin-mode [global | local]

dag-ipv6-prefix-len [integer]

icmp-hash [icmp | ipicmp]

edit dag-globals

options:

all-properties

non-default-properties

**DISPLAY**

list dag-globals

show running-config dag-globals

options:

all-properties

non-default-properties

one-line

**DESCRIPTION**

Provides the ability to configure global disaggregation settings.

**round-robin-mode**

Specifies whether the round robin disaggregator (DAG) on a blade can disaggregate packets to all the TMMs in the system or only to the TMMs local to the blade.

**dag-ipv6-prefix-len**

Specifies whether SPDAG or IPv6 prefix DAG should be used to disaggregate IPv6 traffic when vlan cmp hash is set to src-ip or dst-ip. The default value is 128, using SPDAG.

**icmp-hash**

Specifies ICMP hash for ICMP echo request and ICMP echo reply in SW DAG. ICMP echo request and ICMP echo reply can be disaggregated based on ICMP id or ICMP id and IP addresses. The default ICMP hash is ICMP id.

**SEE ALSO**

list, modify, show, tmsh

# net dns-resolver

**NAME**  
resolver - Configures a DNS resolver on the BIG-IP(r) system.

**MODULE**  
net dns-resolver

**SYNTAX**  
Configure the DNS resolver component using the syntax in the following sections.

**CREATE/MODIFY**  
create [name]  
modify [name]  
options:  
  answer-default-zones [yes | no]  
  app-service [[string] | none]  
  cache-size [integer]  
  description [string]  
  forward-zones [add | delete | modify | replace-all-with] {  
    [ [zone-name] ] {  
options:  
  nameservers [add | delete | replace-all-with] {  
    [ [IPv4address:port] | [IPv6address.port] ]  
  }  
  nameservers none  
  }  
  forward-zones none  
  randomize-query-name-case [yes | no]  
  route-domain [name]  
  use-ipv4 [yes | no]  
  use-ipv6 [yes | no]  
  use-tcp [yes | no]  
  use-udp [yes | no]

**DISPLAY**  
list  
list [ [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties  
  one-line  
show [name]  
reset-stats

**DELETE**  
delete [name]

**DESCRIPTION**  
You can use the dns-resolver component to configure and view information about a DNS Resolver object. A DNS resolver performs recursive resolution to fill its cache.

**Important:** When sizing caches, consider the total amount of memory available and how you wish to allocate memory for DNS caching. Note that cache sizing values are per-TMM process; therefore, a platform with eight TMMs consumes the amount of memory set for the Resolver object times eight.

**Important:** DNS Resolver objects use the DNS root nameservers published by InterNIC.

**EXAMPLES**  
list  
  
Displays the properties of the DNS Resolver myRes.

**OPTIONS**  
**answer-default-zones**  
Specifies whether the resolver answers queries for default zones: localhost, reverse 127.0.0.1 and ::1, and AS112 zones. The default value is no.

**app-service**  
Specifies the name of the application service to which this dns-resolver belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this dns-resolver. Only the application service can modify or delete this dns-resolver.

**cache-size**  
Specifies the maximum cache size in bytes of the DNS Resolver object. The default value is 5767168.

The BIG-IP system caches the supporting records in a DNS response in the resource record cache. After the maximum size of the cache is reached, when new or refreshed content is added to the cache, the expired and older content is removed from the cache. A higher maximum size allows more DNS responses to be cached and increases the cache hit percentage. A lower maximum size forces earlier eviction of cached content, but can lower the cache hit percentage.

**description**  
User defined description.

**forward-zones**  
Adds, deletes, modifies, or replaces a set of forward zones on a DNS Resolver, by specifying zone name(s). A given zone name should only use the symbols allowed for a fully qualified domain name

(FQDN), namely ASCII letters a through z, digits 0 through 9, hyphen -, and period .. For example site.example.com would be a valid zone name.

A DNS Resolver configured with a forward zone will forward any queries that resulted in a cache-miss (the answer was not available in the cache) and which also match a configured zone name, to the nameserver specified on the zone. If no nameservers are specified on the zone, an automatic SERVFAIL is returned. When a forward zone's nameserver returns a valid response to the DNS Cache, that response is cached and then returned to the requestor.

#### nameservers

Adds, deletes, modifies, or replaces a set of nameservers in a forward zone on a DNS Resolver. A nameserver is represented by an IP address and port in the format [IPv4:port] or [IPv6:port], for example 10.10.10.10:53 or 2001::1:ff.53, respectively.

If more than one nameserver is listed for a given forward zone, a matching query will be sent to the nameserver that is currently deemed the most responsive (based on RTTs). If no response is received within a certain window of time, the DNS Resolver will resend the query to another nameserver with an increased wait window, until a response is received.

`glob` Displays the items that match the glob expression. See `help glob` for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

#### randomize-query-name-case

Specifies whether the resolver randomizes the case of query names. The default value is `yes`.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

#### route-domain

Specifies the route domain the resolver uses for outbound traffic. The default value is the default route domain.

#### use-ipv4

Specifies whether the resolver sends DNS queries to IPv4 addresses. The default value is `yes`.

#### use-ipv6

Specifies whether the resolver sends DNS queries to IPv6 addresses. The default value is `yes`.

#### use-tcp

Specifies whether the resolver can send queries over the TCP protocol. The default value is `yes`.

#### use-udp

Specifies whether the resolver can send queries over the UDP protocol. The default value is `yes`.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `show`, `modify`, `regex`, `tmsh`

## net f5optics

#### NAME

f5optics - Manage f5optics package.

#### MODULE

net

#### SYNTAX

Manage net f5optics using the syntax in the following section.

#### INSTALL

install f5optics  
options:

```
recovery
slot [ [slot number] | all ]
```

```
SHOW
show f5optics
```

#### DESCRIPTION

The f5optics package specifies the supported optical PHY modules and their tuning parameters for network interfaces. You can use the f5optics component to manage the f5optics package. The install command will install f5optics with the latest f5optics package under /shared/f5optics/images. Additionally, for a cluster, you can use the slot option to specify either a specific slot or all slots to install the f5optics package.

Notice that the installation will cause network interfaces to be re-initialized on the affected slot(s), hence a temporary traffic interruption.

The show command will display the version information of the installed f5optics package on the appliance, or all the slots in a cluster.

#### EXAMPLES

```
install net f5optics
```

Install the f5optics package on the appliance, or all the slots in a cluster.

```
install net f5optics slot all
```

Install the f5optics package on all the slots in a cluster.

```
install net f5optics recovery slot all
```

Install the f5optics package on all the slots in a cluster, even if it is not newer than the installed package.

```
install net f5optics slot 2
```

Install the f5optics package on slot 2.

```
show net f5optics
```

Show the f5optics package on the appliance, or all the slots in a cluster.

#### OPTIONS

```
recovery
Always install the latest f5optics package, even if it is not newer than the installed package. This is for recovery purposes.
```

```
slot [ [slot number] | all ]
Install the f5optics package on either a specific slot or all slots in a cluster, without changing the active volume of the slot(s).
```

This option is only available in a clustered environment.

#### SEE ALSO

```
install, show, tmsh
```

## net fdb tunnel

```
NAME
tunnel - Manages tunnel entries in the Layer 2 Forwarding table.
```

```
MODULE
net fdb
```

```
SYNTAX
Configure the tunnel component within the net fdb module using the syntax in the following sections.
```

```
DISPLAY
show tunnel
show tunnel [ [ [tunnel name] | [glob] | [regex] ] ... ]
options:
dynamic
field-fmt
```

#### DESCRIPTION

You can use the tunnel component to manage tunnel entries in the Layer 2 Forwarding tables.

#### EXAMPLES

```
show tunnel
```

Displays all dynamic tunnel entries in the Layer 2 Forwarding table.

#### OPTIONS

```
all-records
```

Shows, from the specified Tunnel, all dynamic records.

```
dynamic
```

Displays all dynamic tunnel entries in the Layer 2 Forwarding table.

```
glob
```

Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

```
regex
```

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### SEE ALSO

glob, net tunnels, regex, show, tmsb

#### COPYRIGHT

## net fdb vlan

#### NAME

vlan - Manages VLAN entries in the Layer 2 Forwarding table.

#### MODULE

net fdb

#### SYNTAX

Configure the vlan component within the net fdb module using the syntax in the following sections.

#### MODIFY

```
modify vlan [vlan name]
```

#### options:

```
app-service [[string] | none]
```

#### records

```
[add | delete | modify | replace-all-with] {
```

```
[MAC address] ... {
```

```
app-service [[string] | none]
```

```
description [string]
```

```
trunk [trunk name]
```

```
interface [interface name]
```

```
}
```

```
}
```

```
records none
```

```
edit vlan [ [ all | [vlan name] | [glob] | [regex] ] ... ]
```

#### options:

```
all-properties
```

```
non-default-properties
```

#### DISPLAY

```
list vlan
```

```
list vlan [ [ [vlan name] | [glob] | [regex] ] ... ]
```

```
show running-config vlan
```

```
show running-config vlan [ [vlan name] | [glob] | [regex] ] ... ]
```

#### options:

```
all-properties
```

```
non-default-properties
```

```
one-line
```

```
partition
```

```
records
```

```
show vlan
```

```
show vlan [ [ [vlan name] | [glob] | [regex] ] ... ]
```

#### options:

```
dynamic
```

```
field-fmt
```

```
static
```

```
DELETE
delete vlan
delete vlan [all | [vlan name] ]
options:
  all-records
  dynamic
  static
```

#### DESCRIPTION

You can use the vlan component to manage entries in VLAN Layer 2 Forwarding tables.

#### EXAMPLES

```
modify vlan internal records add { 00:0b:09:88:00:9a { interface 1.2 }
}
```

Creates a mapping of the MAC address 00:0b:09:88:00:9a to interface 1.2 on VLAN internal.

```
modify vlan internal records modify { 00:0b:09:88:00:9a { interface 1.1
} }
```

Modifies the mapping of the MAC address 00:0b:09:88:00:9a to interface 1.1 on VLAN internal.

```
show vlan
```

Displays all dynamic and static entries in the Layer 2 Forwarding table.

```
list vlan all-properties
```

Displays all properties for all static entries in the Layer 2 Forwarding table.

```
list vlan non-default-properties
```

Displays all non-default properties for all static entries in the Layer 2 Forwarding table.

```
delete vlan all
```

Deletes all entries in all VLAN Layer 2 Forwarding tables.

#### OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

all-records

Deletes, from the specified VLAN, all dynamic and static records.

description

User defined description.

dynamic

Displays or deletes all dynamic entries in the Layer 2 Forwarding table.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

interface

Specifies an interface to which you want to map a MAC address. You must specify either an interface or a trunk when you create an entry in the Layer 2 Forwarding table.

MAC address

Specifies a 6-byte ethernet address in not case-sensitive hexadecimal colon notation, for example, 00:0b:09:88:00:9a. You must specify a MAC address when you create an entry in the Layer 2 Forwarding table.

partition

Displays the administrative partition in which the VLAN resides.

records

Specifies MAC addresses for the VLAN Layer 2 Forwarding table. Specifies MAC addresses that you want to add to, delete from, modify, or replace in the VLAN Layer 2 Forwarding table.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

static

Displays or deletes all static entries in the Layer 2 Forwarding table.

trunk

Specifies a trunk to which you want to map a MAC address. You must specify either an interface or a trunk when you create an entry in the Layer 2 Forwarding table.

#### SEE ALSO

delete, edit, glob, list, modify, net vlan, regex, show, tmsh

## net interface-cos

NAME  
interface-cos - Displays and resets COS (Class of Service) related statistics for the interfaces.

MODULE  
net

SYNTAX  
Display cos related statistics within the net module using the following syntax.

MODIFY  
reset-stats interface-cos

DISPLAY  
show interface-cos  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
global

DESCRIPTION  
You can use the interface-cos component to display COS related statistics, including pkts out and bits out for all 8 COS queue.

EXAMPLES  
show interface-cos  
  
Displays interface COS related statistics for the system.  
  
For information about the command reset-stats, see help reset-stats.

SEE ALSO

#### DESCRIPTION

You can use the interface component to enable or disable an interface, and to display and set media options, duplex mode, and status for an interface. In addition, you can specify whether the interface participates in the spanning tree protocol (STP) configuration, and set per-interface STP parameters such as link type, edge port status, and automatic edge port detection.

#### EXAMPLES

modify interface 1.1 enabled  
Enables the interface named 1.1.

modify interface 1.2 disabled  
Disables the interface named 1.2.

modify interface 1.1 1.2 1.3 stp disable  
Disables STP on the interfaces named 1.1, 1.2, and 1.3.

modify interface 1.1 1.2 1.3 stp-auto-edge-port enabled  
Sets auto edge detection for STP on the interfaces named 1.1, 1.2, and 1.3.

modify interface 1.1 1.2 1.3 stp-edge-port true  
Sets the edge port attribute for STP on the interfaces named 1.1, 1.2, and 1.3.

#### OPTIONS

description  
User defined description.

[disabled | enabled]  
Enables or disables the specified interface. The default value is enabled.

flow-control  
Specifies how the system controls the sending of PAUSE frames for flow control. The default value is tx-rx.

none Disables flow control.

rx Specifies that the interface honors pause frames from its partner, but does not generate pause frames.

tx Specifies that the interface ignores pause frames from its partner, and generates pause frames when necessary.

tx-rx  
Specifies that the interface honors pause frames from its partner, and also generates pause frames when necessary.

force-gigabit-fiber  
Enables or disables forcing of gigabit fiber media. If this is enabled for a gigabit fiber interface, the media setting will be forced, and no auto-negotiation will be performed. If it is disabled, auto-negotiation will be performed with just a single gigabit fiber option advertised.

forward-error-correction  
Enables or disables IEEE 802.3bm Clause 91 Reed-Solomon Forward Error Correction (RS-FEC) on 100G interfaces. This setting is not valid for LR4 media. This setting must be the same on both ends of the link.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

if-index  
Displays the index assigned to this interface. It is a unique identifier assigned for all objects displayed in the SNMP IF-MIB.

mac-address  
Displays the 6-byte ethernet address in not case-sensitive hexadecimal colon notation, for example, 00:0b:09:88:00:9a.

media  
Specifies the settings for the interface. The possible values are: 10baseT-full, 10baseT-half, 10GbaseER full, 10GbaseLR-full, 10GbaseSR-full, 10GbaseT-full, 10SFP+Cu-full, 40GbaseSR4-full, 40GbaseLR4-full, 100baseTX-half, 100baseTX-full, 1000baseLX full, 1000baseCX-full, 1000baseT-full, 1000baseT-half, 1000baseSX-full, auto, and no-phy.

When you set the media option, the system automatically sets either the media-sfp or media-fixed option, based on whether the

interface supports small factor form pluggable (SFP) interfaces, or for combo ports whether SFP is the preferred port.

`media-active`

Displays the current media setting for the interface.

`media-fixed`

Specifies the settings for a fixed (non-pluggable) interface. Use this option only with a combo port to specify the media type for the fixed interface, when it is not the preferred port.

`media-max`

Displays the maximum media value for the interface.

`media-sfp`

Specifies the settings for an SFP (pluggable) interface. Note that you use this option only with a combo port to specify the media type for the SFP interface, when it is not the preferred port.

`module-description`

Displays an optics module description about the interface. It is only available on a SFP/SFP+/XFP/QSFP+ unit.

`mtu` Displays the Maximum Transmission Unit (MTU) of the interface, which is the maximum number of bytes in a frame without IP fragmentation.

`name` Specifies an interface name, for example 3.1, where 3 is the physical slot number holding the network interface hardware and 1 is the physical port number of that interface on that hardware. Another example is `mgmt`, the name given to the management interface.

`no-mgmt`

Ensures that no changes are made to the `mgmt` interfaces when all is specified. This is especially convenient when disabling all traffic interfaces using the `disabled` command.

`[pending | not-pending]`

Pending indicates that the slot with which the interface is associated does not contain a blade. Not-pending indicates that the slot with which the interface is associated is not a cluster member. The default value is pending.

`prefer-port`

Indicates which side of a combo port the interface uses, if both sides of the port have the potential for external links. The default value is `sfp`. Do not use this option for non-combo ports.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

`sflow`

Specifies sFlow settings for the interface:

`poll-interval`

Specifies the maximum interval in seconds between two pollings. The default value is 0. To enable this setting, you must also set the `poll-interval-global` setting to `no`.

`poll-interval-global`

Specifies whether the global interface `poll-interval` setting, which is available under `sys sflow global-settings` module, overrides the object-level `poll-interval` setting. The default value is `yes`.

The available values are:

`no` Specifies to use the object-level `poll-interval` setting.

`yes` Specifies to use the global interface `poll-interval` setting.

`serial`

Displays the serial number of the pluggable unit on an interface. It is only available on a SFP/SFP+/XFP/QSFP+ unit.

`stp` Enables or disables STP. If you disable STP, no STP, RSTP, or MSTP packets are transmitted or received on the interface or trunk, and spanning tree has no control over forwarding or learning on the port or the trunk. The default value is enabled.

`stp-auto-edge-port`

Sets the STP automatic edge port detection for the interface. The default value is enabled. When STP automatic edge port detection is set to enabled on an interface, the system monitors the interface for incoming STP, RSTP, or MSTP packets. If no such packets are received for a sufficient period of time (about three seconds), the interface is automatically given edge port status. When automatic edge port detection is set to disabled on an interface, the system does not automatically give the interface the edge port status. Any STP setting set on a per-interface basis applies to all spanning tree instances.

`stp-edge-port`

Sets STP edge port detection. The default value is `true`.

`stp-link-type`

Specifies the STP link type for the interface. The default

value is auto.

The spanning tree system includes important optimizations that can only be used on point-to-point links. That is, on links that connect just two bridges. If these optimizations are used on shared links, incorrect or unstable behavior may result. By default, the implementation assumes that full-duplex links are point-to-point and that half-duplex links are shared.

The options are:

**auto** Specifies that the system determines the spanning tree link type, which is based on the duplex setting.

**p2p** Specifies that the system uses the optimizations for point-to-point spanning tree links. Point-to-point links connect only two spanning tree bridges.

**shared**  
Specifies that the system uses the optimizations for shared spanning tree links. Shared links connect two or more spanning tree bridges.

**stp-reset**  
Resets STP, which forces a migration check.

**qinq-ethertype**  
Specifies the ether-type value used for the packets handled on this port when it is a member in a QinQ vlan. The ether-type can be set to any string containing a valid hexadecimal 16 bits number, or any of the well known ether-types: 0x8100, 0x9100, 0x88a8. Default value is set to 0x8100.

**bundle**  
Sets the bundle capability on the port.

**bundle-speed**  
Sets the bundle-speed on the port when bundle capability is enabled.

**if-index**  
Displays the index assigned to this interface. It is a unique identifier assigned for all objects displayed in the SNMP IF-MIB.

**vendor**  
Displays the name of the vendor of the pluggable unit on an interface. It is only available on a SFP/SFP+/XFP/QSFP+ unit.

**vendor-partnum**  
Displays the part number programmed by the vendor of the pluggable unit on an interface. It is only available on a SFP/SFP+/XFP/QSFP+ unit.

## net ipsec ike-daemon

**NAME**  
ike-daemon - Configures the Internet Key Exchange (ISAKMP) daemon.

**MODULE**  
net ipsec

**SYNTAX**  
Configure the ike-daemon component within the net ipsec module using the syntax in the following sections.

**MODIFY**  
modify ike-daemon  
options:  
description [string]  
isakmp-natt-port [port number]  
isakmp-port [port number]  
log-level [error|warning|notify|info|debug|debug2]  
natt-keep-alive [seconds]  
log-publisher [string]

```

DISPLAY
list
list ike-daemon
show running-config ike-daemon
  options:
    all-properties
    non-default-properties
    one-line

DESCRIPTION
  You can use the ike-daemon component to configure global settings for
  the IKE agent.

EXAMPLES
  modify ike-daemon isakmp-port 500

  Sets the isakmp port to 500.

OPTIONS
  description
  User defined description.

  isakmp-natt-port
  Specifies the port that the IKE daemon uses to accept ISAKMP
  messages when NAT-Traversal is detected. This is also the port
  number used to accept UDP-encapsulated ESP traffic for NAT-
  Traversal. Only 4500 is currently supported.

  isakmp-port
  Specifies the port that the IKE daemon uses to accept ISAKMP
  messages. Only 500 is currently supported.

  log-level
  Specifies the logging level of the IKE daemon. The log file is
  located at /var/log/racoon.log.

  natt-keep-alive
  Specifies the interval between sending NAT-Traversal keep-alive
  packets. The default value is 20 seconds. Set to 0 to disable
  keep-alive packets.

  log-publisher
  Specifies the logging publisher. A new log-publisher object can be
  created via TMSH command tms create sys log-config publisher.

```

#### DISPLAY

```

list ike-peer
show running-config ike-peer
options:
    all-properties
    non-default-properties
    one-line
show ike-peer
show ike-peer [name]

```

#### DELETE

```
delete ike-peer [string]
```

#### DESCRIPTION

You can use the ike-peer component to modify the IKE phase 1 parameters for each remote IKE peer. The setting in the default anonymous ike-peer will apply to any peer that does not match a more specific ike-peer directive.

#### EXAMPLES

```
create ike-peer SanJose { remote-address 1.2.3.4 preshared-key abc
phase1-auth-method pre-shared-key }
```

Creates an ike-peer named SanJose that has the IP address of 1.2.3.4 using preshared key as the authentication method.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### ca-cert-file

Specifies the file name, which contains the certificates of the trusted root and intermediate certificate authorities.

##### crl-file

Specifies the file name of the Certificate Revocation List.

##### description

User-defined description.

##### dpd-delay

This option activates the Dead Peer Detection (DPD) and sets the time (in seconds) allowed between two proofs of liveness requests. The default value is 30. When the value is set to 0, it means to disable DPD monitoring, but still negotiate DPD support.

##### generate policy

This directive is for the responder. To use it, set passive to true so the IKE peer is only a responder. If the responder does not have any policy in the Security Policy Database (SPD) during phase 2 negotiation, and the directive is set to on, then the racoon daemon chooses the first proposal in the Security Association (SA) payload from the initiator, and generates policy entries from the proposal. It is useful to negotiate with clients whose IP address is allocated dynamically. If an inappropriate policy is installed into the responder's SPD by the initiator, other communications might fail due to a policy mismatch between the initiator and the responder. The initiator ignores this directive. The default value is off.

##### lifetime

Specifies the lifetime of an IKE SA that will be proposed in the phase 1 negotiations.

mode Specifies the exchange mode for phase 1 when racoon is the initiator, or the acceptable exchange mode when racoon is the responder.

##### my-cert-file

Specifies the name of my certificate file. The certificate type must match the phase1-auth-method value. Note that there are no default certificates for DSS and ECDSA authentication methods.

##### my-cert-key-file

Specifies the name of my certificate key file. The certificate key type must match the phase1-auth-method value. Note that there are no default keys for DSS and ECDSA authentication methods.

##### my-cert-key-passphrase

Specifies the passphrase of the key used for my-cert-key-file.

Note that only IKEv2 supports passphrase.

**my-id-type**

Specifies the identifier type sent to the remote host to use in the phase 1 negotiation.

**my-id-value**

Specifies the identifier value sent to the remote host to use in the phase 1 negotiation.

**nat-traversal**

Enables use of the NAT-Traversal IPsec extension (NAT-T). NAT-T allows one or both peers to reside behind a NAT gateway (that is, performing address- or port-translation). The presence of NAT gateways along the path is discovered during the phase 1 handshake, and if found, NAT-T is negotiated. When NAT-T is in charge, all ESP and AH packets of a given connection are encapsulated into UDP datagrams (port 4500, by default). The options are:

**force**

NAT-T is used regardless of whether NAT is detected between the peers.

**off** NAT-T is not proposed/accepted. This is the default.

**on** NAT-T is used when a NAT gateway is detected between the peers.

**passive**

Specify true if you do not want to be the initiator of the IKE negotiation with this ike-peer.

**peers-cert-file**

Specifies the peer's certificate for authentication. Deprecated in IKEv2 configuration.

**peers-cert-type**

Specifies that the only peers-cert-type supported is certfile. Deprecated in IKEv2 configuration.

**peers-id-type**

Specifies that address, fqdn, asn1dn, user-fqdn, or keyid-tag can be used as peers-id-type.

**peers-id-value**

Specifies the peer's identifier to be received. If it is not defined, then the IKE agent will not verify the peer's identifier in the ID payload transmitted from the peer. The usage of peers-id-type and peers-id-value is the same as my-id-type and my-id-value except that the individual component values of an asn1dn identifier may be specified as \* to match any value (for example, "C=XX, O=MyOrg, OU=\*, CN=Mine").

**phase1-auth-method**

Defines the authentication method used for the phase 1 negotiation. Possible values are: pre-shared-key if using pre-shared-key, and rsa-signature, dss, ecdsa-256, ecdsa-384 or ecdsa-521 if using X.509 certificate-based authentication. Note that dss, ecdsa certificates are supported in IKEv2 only."

**phase1-encrypt-algorithm**

Specifies the encryption algorithm used for the ISAKMP phase 1 negotiation. This directive must be defined. Possible value is one of following: des, 3des, blowfish, cast128, aes, or camellia for Oakley.

**phase1-hash-algorithm**

Defines the hash algorithm used for the ISAKMP phase 1 negotiation. This directive must be defined. The algorithm should be one of following: md5, sha1, sha256, sha384, or sha512 for Oakley.

**phase1-perfect-forward-secrecy**

Defines the Diffie-Hellman group for key exchange to provide perfect forward secrecy. This directive must be defined in one of Diffie-Hellman groups: modp768, modp1024, modp1536, modp2048, modp3072, modp4096, modp6144 and modp8192, or one of Elliptic-Curve Diffie-Hellman groups: ecp256, ecp384 and ecp521. Note that ECDH is supported in IKEv2 only.

**pre-shared-key**

Specifies the pre-shared key for ISAKMP SAs. This field is valid only when phase1-auth-method is pre-shared-key.

**pre-shared-key-encrypted**

Specifies the pre-shared key for ISAKMP SAs. This field is valid only when phase1-auth-method is pre-shared-key. Stores pre-shared-key in encrypted form.

**prf** Specifies the pseudo-random function to derive keying material for all cryptographic operations.

**proxy-support**

If this value is enabled, both values of ID payloads in the phase 2 exchange are used as the addresses of end-point of IPsec-SAs. This attribute must be enabled, which is the default value. This field is used only for IKEv1.

**remote-address**

Specifies the IP address of the IKE remote node. The format required for specifying a route domain ID in an IP address is A.B.C.D%ID. For example, A.B.C.D%2, where the IP address A.B.C.D pertains to route domain 2. The route domain id should be same as

the route domain id specified in the source/destination address of the traffic selector associated with this remote node.

**replay-window-size**

Specifies the replay window size of the IPsec SAs negotiated with the IKE remote node. This window limits the number of out-of-order IPsec packets that can be received relative to the packet with the highest sequence number that has been authenticated so far. Packets with older sequence numbers that are outside this range are rejected. The default value is 64. The valid range is from 4 to 255.

**state**

Enables or disables this IKE remote node.

**traffic-selector**

Specifies the names of the traffic-selector objects associated with this ike-peer.

**verify-cert** If set to true, the identifier sent by the remote host (as specified in its my\_identifier statement) is compared with the credentials in the certificate as follows: Type asnldn: the entire certificate subject name is compared with the identifier, e.g. \"C=XX, O=YY, ...\". Type address, fqdn, or user\_fqdn: The certificate's subjectAltName is compared with the identifier. If the two do not match, the negotiation will fail. The default value is false, which is not to verify the identifier using the peer's certificate.

**version**

Specifies which version of IKE to be used. The default value is v1. The following versions are available:

- v1 Specifies version IKEv1 will be used.
- v2 Specifies version IKEv2 will be used.

## net ipsec ike-sa

**NAME**

ike-sa - Displays IKE security associations on the BIG-IP(r) system.

**MODULE**

net ipsec

**SYNTAX**

Use the ike-sa component within the ipsec module to manage IKE security associations using the following syntax.

**DISPLAY**

show ike-sa

**option:**

all-properties  
peer-ip [IP address]  
peer-name [name]  
route-domain [integer]  
traffic-selector [name]

**DESCRIPTION**

You can use the ike-sa component to display information about IKE security associations in the system.

**EXAMPLES**

show ike-sa all-properties

Display detail information about IKE security associations.

**OPTIONS**

**peer-ip**

Specifies the peer IP address of the security associations that you want to display.

**peer-name**

Specifies the peer name of the security associations that you want to display.

**route-domain**

Specifies route domain used for traffic that you want to display. The default value is the default route domain.

traffic-selector  
Specifies the name of the traffic-selector associated with the security associations that you want to display.

## net ipsec ipsec-policy

NAME  
ipsec-policy - Configures the IPsec security policy.

MODULE  
net ipsec

SYNTAX  
Configure the ipsec-policy component within the net ipsec module using the syntax in the following sections.

### CREATE/MODIFY

```
create ipsec-policy [name]
modify ipsec-policy [name]
options:
  app-service [[string] | none]
  description [string]
  ike-phase2-auth-algorithm [aes-gcm128 | aes-gcm192 | aes-gcm256 | aes-gmac128 | aes-gmac192 | aes-gmac256 | sha1 |
  ike-phase2-encrypt-algorithm [3des | aes128 | aes192 | aes256 | aes-gcm128 | aes-gcm192 | aes-gcm256 | aes-gmac128
  ike-phase2-lifetime [integer]
  ike-phase2-lifetime-kilobytes [integer]
  ike-phase2-perfect-forward-secrecy [modp1024 | modp1536 | modp2048 | modp3072 | modp4096 | modp6144 | modp768 | mo
  ipcomp [deflate| none | null]
  mode [transport | tunnel | isession | interface]
  protocol [esp]
  tunnel-local-address [ip address]
  tunnel-remote-address [ip address]
```

### DISPLAY

```
list ipsec-policy
list ipsec-policy
list ipsec-policy [ [name] | [glob] | [regex] ] ... ]
show running-config ipsec-policy
show running-config ipsec-policy [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  partition

show ipsec-policy
show ipsec-policy [name]
```

### DISPLAY

```
show ipsec-policy [name]
```

### DESCRIPTION

An ipsec-policy indicates the ipsec rule and action to be applied to the packets matched by the traffic-selector associated with this ipsec-policy.

### EXAMPLES

```
create ipsec ipsec-policy tunnel_policy_sjc_sea { description "ipsec
policy for the sjc-sea ipsec tunnel" mode tunnel tunnel-local-address
1.1.1.1 tunnel-remote-address 2.2.2.2 }
```

Creates the tunnel mode ipsec-policy tunnel\_policy\_sjc\_sea.

```
delete ipsec ipsec-policy tunnel_policy_sjc_sea
```

Deletes the ipsec-policy tunnel\_policy\_sjc\_sea.

### OPTIONS

#### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

#### description

User defined description.

**ike-phase2-auth-algorithm**  
Specifies a payload authentication algorithm for ESP. This attribute is only valid when IKE is used to negotiate Security Associations. The possible options are: aes-gcm128, aes-gcm192, aes-gcm256, aes-gmac128, aes-gmac192, aes-gmac256, sha256, sha384, sha512 and sha1. The default value is aes-gcm128.

Note: Because aes-gcm and aes-gmac are authenticated encryption algorithms, when ike-phase2-auth-algorithm is set to aes-gcm or aes-gmac, ike-phase2-encrypt-algorithm has to be set to the identical algorithm with the same key length. sha256, sha384, sha512 and sha1 can only be used with an encryption algorithm that is NOT an authenticated encryption algorithm.

**ike-phase2-encrypt-algorithm**  
Specifies an encryption algorithm for ESP. This attribute is only valid when IKE is used to negotiate security associations. The default value is aes-gcm128.

Note: Because aes-gcm and aes-gmac are authenticated encryption algorithms, when ike-phase2-encrypt-algorithm is set to one of these algorithms, ike-phase2-auth-algorithm has to be set to the identical algorithm with the same key length.

**ike-phase2-lifetime**  
Specifies the lifetime duration in minutes, for the dynamically-negotiated security associations (SA). This attribute is only valid when IKE is used to negotiate security associations.

**ike-phase2-lifetime-kilobytes**  
Specifies the lifetime duration in kilobytes, for the dynamically-negotiated security associations (SA). This attribute is only valid when IKE is used to negotiate security associations. A value of '0' means the SA will not re-key based on the number of bytes encrypted/decrypted. The minimum recommended value is 1000 kilobytes. This value is not negotiated between peers."

**ike-phase2-perfect-forward-secrecy**  
Defines the group of Diffie-Hellman exponentiations. This attribute is only valid when IKE is used to negotiate Security Associations. The value 'none' indicates that the PFS is disabled for phase2 SA negotiations.

**mode** Specifies a security protocol mode for use. The options are:

**transport**  
IPsec transport mode is used.

**tunnel**  
IPsec tunnel mode is used.

**isession**  
A special tunnel mode ipsec-policy that is only applicable on wom, remote-endpoint, or local-endpoint.

**interface**  
IPsec interface mode is used.

**protocol**  
Specifies the IPsec protocol: Encapsulating Security Payload (ESP) or Authentication Header (AH).

**ipcomp**  
Specifies the compression algorithm for IPComp. The following codec are available:

**none** Disable IPComp

**deflate**  
Packets will be encapsulated with IPComp header and Deflate compression algorithm will be applied to the data.

**null** Packets will be encapsulated with IPComp header but no compression algorithm will be applied to the data.

**tunnel-local-address**  
Specifies the IP address of the local IPsec tunnel endpoint. This option is only valid when mode is tunnel. The format required for specifying a route domain ID in an IP address is A.B.C.D%ID. For example, A.B.C.D%2, where the IP address A.B.C.D pertains to route domain 2.

**tunnel-remote-address**  
Specifies the IP address of the remote IPsec tunnel endpoint. This option is only valid when mode is tunnel. The format required for specifying a route domain ID in an IP address is A.B.C.D%ID. For example, A.B.C.D%2, where the IP address A.B.C.D pertains to route domain 2.

## net ipsec ipsec-sa

**NAME**  
ipsec-sa - Displays IPsec security associations on the BIG-IP(r) system.

**MODULE**  
net ipsec

**SYNTAX**  
Use the ipsec-sa component within the ipsec module to manage IPsec security associations using the following syntax.

**DISPLAY**  
show ipsec-sa  
option:  
all-properties  
src-addr [IP address]  
dst-addr [IP address]  
route-domain [integer]  
spi [integer]  
traffic-selector [name]

**DESCRIPTION**  
You can use the ipsec-sa component to display information about IPsec security associations in the system.

**EXAMPLES**  
show ipsec-sa all-properties  
  
Display detail information about IPsec security associations.

**OPTIONS**  
src-addr  
Specifies the source IP address of the security associations that you want to display.  
  
dst-addr  
Specifies the destination IP address of the security associations that you want to display.  
  
route-domain  
Specifies route domain used for traffic that you want to display. The default value is the default route domain.  
  
spi Specifies the SPI of the security associations that you want to display.  
  
traffic-selector  
Specifies the name of the traffic-selector object associated with the security associations that you want to display.

**SEE ALSO**  
show, net ipsec traffic-selector, net ipsec ipsec-policy, tmsh

**COPYRIGHT**

## net ipsec manual-security-association

**NAME**  
manual-security-association - Configures the IPsec manual-security-association.

**MODULE**  
net ipsec

## SYNTAX

Configure the manual-security-association component within the net ipsec module using the syntax in the following sections.

### CREATE/MODIFY

```
create manual-security-association
modify manual-security-association
options:
  app-service [[string] | none]
  description [string]
  auth-algorithm [shal]
  auth-key [key]
  destination-address [ip address]
  encrypt-algorithm [3des|aes128|aes192|aes256|null]
  encrypt-key [key]
  ipsec-policy [name]
  protocol [esp]
  source-address [ip address]
  spi [number]
```

### DISPLAY

```
list manual-security-association
show manual-security-association
show running-config manual-security-association
options:
  app-service
  all-properties
  non-default-properties
  one-line
```

### DELETE

```
delete manual-security-association [name]
```

## DESCRIPTION

Manually configures Security Association Database(SAD) entries. Because each SA provides data protection only for unidirectional traffic, you must configure a manual-security-association for traffic in each direction to establish a bidirectional IPsec tunnel.

## EXAMPLES

```
create ipsec manual-security-association msa_on_dut2_transport_in {
  auth-key test description "manual security association on dut2 for dut1
- transport" destination-address 7.7.7.7 encrypt-key test ipsec-policy
transport_policy_on_dut2 source-address 2.2.2.2 spi 1025 }
```

Creates a manual-security-association object named msa\_on\_dut2\_transport\_in to use IPsec to protect traffic from 2.2.2.2 to 7.7.7.7 with the authentication key test and the encryption key test. The ipsec-policy object named transport\_policy\_on\_dut2 is associated with this manually configured security association.

## OPTIONS

### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

### auth-algorithm

Specifies an authentication algorithm.

### auth-key

Specifies the key for the authentication algorithm.

### auth-key-encrypted

Displays the encrypted auth-key.

### description

User-defined description.

### destination-address

Specifies the destination of the security association.

### encrypt-algorithm

Specifies an encryption algorithm.

### encrypt-key

Specifies the key for the encryption algorithm.

### encrypt-key-encrypted

Display the encrypted encrypt-key.

### ipsec-policy

Specifies the ipsec-policy associated with this manual-security-association.

### protocol

Specifies the IPsec protocol: Encapsulating Security Payload (ESP) or Authentication Header (AH).

### source-address

Specifies the source address of the security association.

spi Specifies the Security Parameters Index. If this is the Security Association(SA) for the outbound traffic, make sure it matches the SPI of the inbound SA configured on the remote site and vice versa. SPI values between 0 and 255 are reserved for the future use by IANA and cannot be used.

## net ipsec traffic-selector

**NAME**  
traffic-selector - Configures a traffic selector for IPsec.

**MODULE**  
net ipsec

**SYNTAX**  
Configure the traffic-selector component within the net ipsec module using the syntax in the following sections.

**CREATE/MODIFY**  
create traffic-selector [name]  
modify traffic-selector [name]  
options:  
  action [protect]  
  app-service [[string] | none]  
  description [string]  
  destination-address [ip address/netmask]  
  destination-port [port number]  
  direction [both | in | out]  
  ipsec-policy [name]  
  ip-protocol [protocol number]  
  order [integer]  
  source-address [ip address/netmask]  
  source-port [port number]

**DISPLAY**  
list  
list traffic-selector

**DELETE**  
B

**DESCRIPTION**  
You can use the traffic-selector component to specify which incoming traffic you want the system to protect with IPsec.

**EXAMPLES**  
create traffic-selector sjc2sea { source-address 10.10.10.0/24  
  destination address 20.20.20.0/24 direction both ipsec-policy  
  my\_policy}  
  
Creates a traffic-selector named sjc2sea, which has the IP address of 10.10.10.0/24 using ipsec-policy named my\_policy.

**OPTIONS**  
**action**  
Specifies how the system handles traffic that matches the criteria in the traffic selector. Only protect is currently supported.  
  
**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.  
  
**description**  
User defined description.  
  
**destination-address**  
Specifies the destination IP address of the traffic to be matched. The format required for specifying a route domain ID in an IP address is A.B.C.D%ID. For example, A.B.C.D%2, where the IP address A.B.C.D pertains to route domain 2.  
  
**destination-port**  
Specifies the destination port number of the traffic to be matched.  
  
**direction**  
Specifies the direction of traffic to be protected with IPsec. If the direction is both, use source-address and destination-address with respect to the outbound direction. The default value is both.  
  
**ip-protocol**  
Specifies the IP protocol of the traffic to be matched.

**ipsec-policy**  
Specifies the name of the IPsec policy to be enforced on the matched traffic.

**order**  
Specifies the order in which traffic is matched, if traffic can be matched to multiple traffic selectors. Traffic is matched to the the traffic selector with the highest priority (lowest order number).

**source-address**  
Specifies the source IP address of the traffic to be matched. The format required for specifying a route domain ID in an IP address is A.B.C.D%ID. For example, A.B.C.D%2, where the IP address A.B.C.D pertains to route domain 2.

**source-port**  
Specifies the source port number of the traffic to be matched.

## net lldp-globals

**NAME**  
lldp-globals - configure lldp global settings.

**MODULE**  
net

**SYNTAX**  
Configure the lldp-globals component within the net module using the syntax shown in the following sections.

**MODIFY**  
modify lldp-globals  
options:  
[disabled | enabled]  
max-neighbors-per-port[integer]  
reinit-delay[integer]  
tx-delay[integer]  
tx-hold[integer]  
tx-interval[integer]  
edit lldp-globals  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list lldp-globals  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
Provides the ability to configure global LLDP settings.

[disabled | enabled]  
To disable or enable LLDP feature on BIGIP.

max-neighbors-per-port  
Specifies maximum neighbors per port BIGIP LLDP feature supports.

reinit-delay  
Specifies time delay, in seconds, from when LLDP ports is disabled to a new LLDP initialization.

tx-delay  
Specifies the minimum time delay, in seconds, between successive LLDP frame transmissions.

tx-hold  
Specifies the multiplier to use to calculate the TTL of transmitted LLDP frame.

tx-interval  
Specifies the time interval, in seconds, between LLDP frame transmission to its neighbors.

## net mroute

NAME  
mroute - Displays the multicast routes in the BIG-IP(r) system.

MODULE  
net

SYNTAX  
Display multicast route (mroute) entries within the net module using the syntax given below.

DISPLAY  
show net mroute  
options:  
source [IP address]  
group [multicast group address]

DESCRIPTION  
Use the mroute component to display all the multicast routes in the BIG-IP(r) system. Results can be filtered using source option, group option, or both.

EXAMPLES  
show net mroute

Displays all the multicast routes in the system.

```
show net mroute source 10.10.10.1
```

Displays all the multicast routes in the system whose source IP address is 10.10.10.1.

```
show net mroute group 224.1.0.13
```

Displays all the multicast routes in the system whose group multicast address is 224.1.0.13.

```
show net mroute source 10.10.10.1 group 224.1.0.13
```

Displays all the multicast routes in the system whose source IP address is 10.10.10.1 and group multicast address is 224.1.0.13.

#### OPTIONS

source

Specifies the source IP address of the multicast routes that you want to display.

group

Specifies the multicast group address to display. Only a single group may be specified with the group option.

#### SEE ALSO

show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## net multicast-globals

#### NAME

multicast-globals - Global IP multicast configuration options

#### MODULE

net

#### SYNTAX

Configure the multicast-globals component within the net module using the syntax shown in the following sections.

#### MODIFY

```
modify multicast-globals
```

```
options:
```

```
route-lookup-timeout [integer value: 0 ~ 2147483647]
```

```
max-pending-routes [integer value: 0 ~ 2147483647]
```

```
max-pending-packets [integer value: 0 ~ 2147483647]
```

```
rate-limit [disabled | enabled]
```

```
edit multicast-globals
```

```
options:
```

```
all-properties
```

```
non-default-properties
```

#### DISPLAY

```
list multicast-globals
```

```
show running-config multicast-globals
```

```
options:
```

```
all-properties
```

```
non-default-properties
```

```
one-line
```

#### DESCRIPTION

Configure global options related to IP multicast traffic processing.

#### EXAMPLES

```
modify multicast-globals route-lookup-timeout 2
```

Specifies the maximum lifetime, in seconds, of an incomplete MFC entry. The default value is 2.

```
modify multicast-globals max-pending-routes 256
```

Specifies the maximum number of incomplete MFC entries any TMM instance can have at one time. The default value is 256.

```
modify multicast-globals max-pending-packets 16
```

Specifies the maximum number of packets queued on behalf of a single

incomplete MFC entry. The default value is 16.

modify multicast-globals rate-limit enabled

When enabled, the packet rate limit configured in the DB variable switchboard.maxmcastrate is enforced. Otherwise multicast packets are not rate limited. The default value is enabled.

#### OPTIONS

## net ndp

#### NAME

ndp - Configures IPv6-to-Ethernet neighbor discovery display and control.

#### MODULE

net

#### SYNTAX

Configure the ndp component within the net module using the syntax in the following sections.

##### CREATE/MODIFY

```
create ndp [name]
options:
  description [string]
  ip-address [ip address]
  mac-address [MAC address]
```

```
modify ndp [name]
options:
  description [string]
  mac-address [MAC address]
```

```
edit ndp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

##### DISPLAY

```
list ndp
list ndp [ [name] | [glob] | [regex] ] ... ]
show running-config ndp
show running-config ndp
[ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

```
show ndp
show ndp [ [name] | [glob] | [regex] ] ... ]
options:
  [all | dynamic | field-fmt | static]
```

##### DELETE

```
delete ndp [ [all] | [name]... ]
```

#### DESCRIPTION

Configures the IPv6-to-Ethernet address translation tables used by the IPv6 neighbor discovery protocol.

#### EXAMPLES

```
create ndp myNdp ip-address fec0:f515::c001 mac-address
00:0B:DB:3F:F6:57
```

Maps the IPv6 address, fec0:f515::c001, to the MAC address, 00:0B:DB:3F:F6:57, and the name of this entry is myNdp. Alternatively, the address can be used as the name, like the following example.

```
create ndp fec0:f515::c001 mac-address 00:0B:DB:3F:F6:57
```

Maps the IPv6 address, fec0:f515::c001, to the MAC address, 00:0B:DB:3F:F6:57.

```
show ndp
```

Displays all static and dynamic IPv6 address-to-MAC address mappings.

#### OPTIONS

**ip-address**

The IP address that is to be mapped. This is optional, and if not present, the name needs to be a string that represents a valid IP address.

**description**

User defined description.

**dynamic**

Displays dynamic IPv6 address-to-MAC address mapping.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**ip-address**

The IP address that is to be mapped. This is optional, and if not present, the name needs to be a string that represents a valid IP address.

**mac-address**

Specifies a 6-byte Ethernet address in hexadecimal colon notation that is not case-sensitive, for example, 00:0b:09:88:00:9a.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**static**

Displays static IPv6 address-to-MAC address mapping.

## net packet-filter-trusted

#### NAME

packet-filter-trusted - Modifies or displays trusted allow lists for packet filters.

#### MODULE

net

#### SYNTAX

Configure the packet-filter-trusted component within the net module using the syntax in the following sections.

#### MODIFY

```
modify packet-filter-trusted
```

```
options:
```

```
description [string]
```

```
ip-addresses none
```

```
ip-addresses
```

```
[add | delete | replace-all-with] {
```

```
[ip address ... ]
```

```
}
```

```
mac-addresses none
```

```
mac-addresses
```

```
[ add | delete | replace-all-with ] {
```

```
[MAC address ...]
```

```
}
```

```
vlans none
```

```
vlans
```

```
[add | delete | replace-all-with] ] {
```

```
[vlan name ... ]
```

```
}
```

```
edit packet-filter-trusted
```

```
DISPLAY
list packet-filter-trusted
show running-config packet-filter-trusted
options:
  all-properties
  non-default-properties
  one-line
```

#### DESCRIPTION

Use the packet-filter-trusted component to create a layer of security for the traffic management system using trusted allow lists.

Trusted allow lists are lists of IP addresses, MAC addresses, and VLANs that are exempt from packet filter rules.

**Important:** By default, packet filtering is disabled. You must enable packet filtering using the Configuration utility. For more information, see the TMOS(r) Management Guide for BIG-IP(r) Systems.

#### EXAMPLE

Creates a trusted allow list that allows anything listed to bypass the packet filter.

In the following example, you have an administrative laptop that you want to have unrestricted access to the traffic management system. This is a laptop, and therefore it might have a different IP address from time to time. One way to solve the problem is to add a trusted MAC address. This trusted allow list example shows the laptop MAC address as 00:02:3F:3E:2F:FE. Now the laptop can access the traffic management system regardless of what address it boots with or to which VLAN it is connected, as long as it is on the same physical segment as the traffic management system.

Also in this example, the traffic management system is configured for basic firewalling of the private/internal network. This example shows a way to filter incoming traffic and allow outgoing traffic to be unrestricted. To do this, you add trusted VLANs that represent all traffic that originated on the internal network. Another way to do this is to use trusted IP addresses instead, for example, 192.168.26.0/24.

```
modify packet-filter-trusted {
  vlans add { internall internal2 }
  mac-addresses add { 00:02:3F:3E:2F:FE }
}
```

#### OPTIONS

**description**  
User defined description.

**ip-addresses**  
Specifies a list of source IP addresses. Any traffic matching a source IP address in the list is automatically allowed. This simplifies configuration of the packet filter to allow trusted internal traffic to be passed from VLAN to VLAN without a filter rule, including out to the Internet. Processing of traffic by this option occurs before rule list evaluation, making it impossible to override this option and mask out (block) certain types of traffic with a packet filter rule. This option is empty by default.

**mac-addresses**  
Specifies a list of MAC addresses. The system allows any traffic matching a MAC address in the source address list. This simplifies configuration of the packet filter to allow trusted internal traffic to be passed from VLAN to VLAN without a filter rule, including out to the Internet. Processing of traffic by this option occurs before rule list evaluation, making it impossible to override this option and mask out (block) certain types of traffic with a packet filter rule. This option is empty by default.

**vlans**  
Specifies a list of ingress VLANs. Any traffic received on a VLAN that is on the ingress VLAN list is automatically allowed. This simplifies configuration of the packet filter to allow trusted internal traffic to be passed from VLAN to VLAN without a filter rule, including out to the Internet. Processing of traffic by this option occurs before rule list evaluation, making it impossible to override this option and mask out (block) certain types of traffic with a packet filter rule. This option is empty by default.

field-fmt

**DELETE**  
delete packet-filter [ all | [name] ]

**DESCRIPTION**  
You can use the packet-filter component to create a layer of security for the traffic management system using packet filter rules.

The BIG-IP(r) system packet filters are based on the Berkeley Software Design Packet Filter (BPF) architecture. Packet filter rules are composed of four mandatory attributes and three optional attributes. The mandatory attributes are name, order, action, and rule. The optional attributes are vlan, logging, and rate-class. The rule attribute you choose defines the BPF script to match for the rule.

**Important:** By default, packet filtering is disabled. You must enable packet filtering using the Configuration utility. For more information, see the TMOS(r) Management Guide for BIG-IP(r) Systems.

**EXAMPLES**  
You can create a set of rules that specify what incoming traffic you want the system to accept and how to accept it. See the examples following.

**Example 1: Block spoofed addresses**  
This example prevents private IP addresses from being accepted on a public VLAN. This is a way of ensuring that no one can spoof private IP addresses through the external VLAN of the system. In this example, the system logs when this happens:

```
create packet-filter spoof_blocker {  
order 5  
action discard  
vlan external  
logging enabled  
rule " (src net 172.19.255.0/24) "  
}
```

**Example 2: Allow restricted management access**  
You can provide restricted SSH and HTTPS access to the traffic management system for management purposes, and keep a log of that access. Note: This not the same management access you can get through the management port/interface (mgmt); that interface is not affected by any packet filter configuration, and if that is the only way you want to allow access to your system, this configuration is not necessary.

In the first rule shown below, SSH is allowed access from a single fixed-address administrative workstation, and each access is logged. In the subsequent rule, browser-based Configuration

utility access is allowed from two fixed-address administrative workstations; however, access is not logged.

```
create packet-filter management_ssh {
order 10
action accept
logging enabled
rule " (proto TCP) and (src host 172.19.254.10) and
(dst port 22) "
}

create packet-filter management_gui {
order 15
action accept
rule " (proto TCP) and (src host 172.19.254.2 or
src host 172.19.254.10) and (dst port 443) "
}
```

#### Example 3: Allow access to all virtual servers

In this final example, you can verify that all of the virtual servers in your configuration are reachable from the public network. This is critical if you have decided to use a default-deny policy. This example also shows how to rate shape all traffic to the virtual server IP address with a default rate class (that can be overridden by individual virtual servers or iRules(r later).

Note: This example has a single virtual server IP, and it does not matter what port traffic is destined for. If you want to be more specific, you can specify each service port, as well (for example, HTTP, FTP, telnet).

```
create packet-filter virtuals {
order 20
action accept
vlan external
rate class root
rule " ( dst host 172.19.254.80 ) "
}
```

#### OPTIONS

You can use these options with the packet-filter component to create packet filter rules:

##### action

Specifies how the system handles a packet that matches the criteria in the packet filter rule. There is no default; you must specify a value when you create a packet filter rule.

The possible values are:

##### accept

Indicates that the system accepts the packet, and stops processing additional packet filter rules, if there are any.

##### continue

Indicates that the system acknowledges the packet for logging or statistical purposes, but makes no decision on how to handle the packet. The system continues to evaluate traffic matching a rule with the Continue action, starting with the next packet filter rule in the list.

##### discard

Indicates that the system drops the packet, and stops processing additional packet filter rules, if there are any.

##### reject

Indicates that the system drops the packet, and also sends a reject packet to the sender, indicating that the packet was refused.

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### logging

Enables or disables packet filter logging. If you omit this value, no logging is performed.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

##### order

Specifies a sort order greater than 0 (zero). No two rules may have the same sort order. There is a single, global list of rules. Each rule in the list has a relative integer order. The system first evaluates the rule with the lowest order value, and then evaluates all other rules based on ascent of the order value assigned to each rule.

For example, if there are 5 rules, numbered 500, 100, 300, 200, 201; the rule evaluation order is 100, 200, 201, 300, 500.

The system compares each packet to be filtered against the list of rules in sequence, starting with the first. Evaluation of the rule

list stops on the first match that has an action of accept, discard or reject. A match on a rule with an action of none does not stop further evaluation of the rule list; the system updates the statistics count and generates a log if the rule indicates it, but otherwise rule processing continues with the next rule in the list.

F5 Networks recommends that you sequence rules for effect and efficiency; generally this means:

-- Assign the lowest order to more specific rules, so that the system will evaluate those rules first.

-- The system evaluates one expression with multiple criteria more efficiently than multiple expressions each with a single criterion.

This option is required.

rate-class

Specifies the name of a rate class. The value is the name of any existing rate class. If omitted, no rate filter is applied.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

rule Specifies the BPF expression to match. The rule is mandatory, however you can leave it empty. If empty, the packet filter rule matches all packets.

vlan Specifies the VLAN to which the packet filter rule applies. The value for this option is any VLAN name currently in existence. If you omit this value, the rule applies to all VLANs. If you do not provide a VLAN name when you create a packet-filter, the rule applies to all VLANs.

## net packet-tester security

#### NAME

packet-tester - Shows if packet with given parameters passes through data path, which AFM policies and rules will be applied to the packet, if it will be dropped or not. This is shown for Dos in global and Virtual server context, IP Intelligence and ACL in global, route domain and listener context. You can only use the show command with this component.

#### MODULE

net

#### SYNTAX

```
show packet-tester security
  dest-addr [IP address]
  source-addr [IP address]
  dest-port [TCP/UDP port]
  source-port [TCP/UDP port]
  protocol [protocol]
  src-vlan [source vlan name]
  check-staged[enable/disable]
  trigger-log[enable/disable]
  ttl[1 to 255]
  syn[SYN TCP FLAG]
  ack[ACK TCP FLAG]
  rst[RST TCP FLAG]
  fin[FIN TCP FLAG]
  push[PUSH TCP FLAG]
  urg[URG TCP FLAG]
```

#### DESCRIPTION

With user provided VLAN, source/destination IP addresses, TCP/UDP ports and protocol, the command will craft a packet and insert into data path to match these parameters against user configured DOS, ACL rules and IP

intelligence global, route domain, VIP/SelfIP context, and return which policies, rules applied and the final action taken on packet. Both IPv4 and IPv6 addresses and IP/UDP/TCP/SCTP protocols are supported. Detail option with provide which specific policy and rule will be applied to such a packet. This command can be used as a diagnostic tool to trouble-shoot BigIP AFM configuration problem. It provides a faster way to identify which AFM config will have impact to the specified packet stream.

#### EXAMPLES

```
[root@bigip208:Active:Standalone] rpm # tmsh -s -m show net packet-  
tester security dst-addr 41.41.41.41 dst-port 80 src-addr 8.8.8.1 src-

## net port-mirror

#### NAME

port-mirror - Configures interface (port) mirroring.

#### MODULE

net

#### SYNTAX

Configure the port-mirror component within the net module using the syntax in the following sections.

#### CREATE/MODIFY

```
create port-mirror [interface_name]
modify port-mirror [interface_name]
options:
  app-service [[string] | none]
  interfaces
    [add | delete | replace-all-with] {
  [interface_name ... ]
  }
  interfaces [default | none]

edit port-mirror [ [ [interface_name] | [glob] | [regex] ] ... ]
options:
  all-properties
```

#### DISPLAY

```
list port-mirror
list port-mirror
  [ [ [interface_name] | [glob] | [regex] ] ... ]
show running-config port-mirror
show running-config port-mirror
  [ [ [interface_name] | [glob] | [regex] ] ... ]
options:
  one-line
```

#### DELETE

```
delete port-mirror [interface_name]
```

#### DESCRIPTION

You can use the port-mirror component to mirror traffic from interfaces on a blade to other interfaces on the same blade or another blade.

#### EXAMPLES

```
create port-mirror 1/1.1 interfaces add 1/1.2 1/1.3 1/1.4
```

Creates a port mirror from interface 1.1 on blade 1 to interfaces 1.2, 1.3, 1.4 on the same blade. The system mirrors traffic from interfaces 1.2, 1.3, and 1.4 on blade 1 to the interface 1.1 on the same blade.

```
modify port-mirror 1/1.1 interfaces delete 1/1.3 1/1.4
```

Deletes interfaces 1.3 and 1.4 on blade 1 from the existing port mirror 1/1.1 on the same blade.

#### OPTION

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application

service can modify or delete the object.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

interface\_name  
Specifies the name of the interface, for example, 1/1.1.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO

## net rate-shaping class

NAME

class - Configures a rate class.

MODULE

net rate-shaping

SYNTAX

Configure the class component within the net rate-shaping module using the syntax in the following sections.

CREATE/MODIFY

```
create class [name]
modify class [name]
options:
  app-service [[string] | none]
  ceiling [integer]
  ceiling-percentage [integer]
  description [string]
  direction [any | to-client | to-server]
  drop-policy [ [custom drop policy name ] | fred | red | tail]
  max-burst [integer]
  parent [class name]
  queue [ [custom queue name | pfifp | sfq]
  rate [integer]
  rate-percentage [integer]
  shaping-policy [ [custom shaping policy name] | none]
```

```
edit class [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list class
list class [ [ [name] | [glob] | [regex] ] ... ]
show running-config class
show running-config class [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  current-module
  non-default-properties
  one-line
```

```
show class
show class [ [ [name] | [glob] | [regex] ] ... ]
options:
  current-module
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
```

DELETE

```
delete class [all | [name] ]
```

DESCRIPTION

You can use the class component to create a rate class. A rate class lets you specify shaping properties for a specific type of traffic, such as Layer 3 traffic that specifies a certain source, destination, or service. Specifically, a rate class defines the number of bits per second that the system accepts per flow and the number of packets in a queue.

You configure rate shaping by creating a class and then assigning the class to a packet filter, a virtual server, or from within an iRule. When you configure a class, you can associate another class with the class you are configuring using the parent option.

You can also associate drop policies, shaping policies, and queues with a class using the drop-policy, shaping-policy, and queue options of the class component. You can associate pre-configured drop policies and queues with the class, or you can create custom drop policies, queues, and shaping policies, and then associate them with the class.

Note that if you specify a value for the shaping-policy option of the class, the system automatically changes the ceiling-percentage, drop-policy, max-burst, queue, and rate-percentage options of the class to match the values in the specified shaping policy.

#### EXAMPLES

```
create class my_class rate 10
```

Creates a class named my\_class with a rate of 10.

```
list class all-properties
```

Displays all of the properties of all of the classes.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### ceiling

Specifies (in bps) how far beyond the value specified for the rate option that traffic can flow. This number sets an absolute limit. No traffic can exceed this rate. The rate class might limit traffic throughput to the value of the rate option when there is high contention among siblings of a parent-child class hierarchy. The default value is the value of the rate option. The minimum value is 296 bps.

##### ceiling-percentage

Specifies the ceiling of the rate class as a percentage of the ceiling of the associated parent class. This option applies only to rate classes with an associated parent rate class. The default value is 0 (zero), which indicates that the class uses the value of the ceiling option.

##### description

User defined description.

##### direction

Specifies the direction of traffic to which the class is applied. The default value is any.

##### drop-policy

Specifies the name of a drop policy. You can use one of the pre-configured drop policies, or you can create a customized drop policy using the drop-policy component.

The default value is tail, which is the simplest drop policy. The pre-configured drop policies are:

**fred** Specifies that the system uses Flow-based Random Early Detection to decide whether to drop packets based on the aggressiveness of each flow.

**red** Specifies that the system uses Random Early Detection to determine whether to drop packets to maintain the average queue length within the specified range.

**tail** Specifies that the system drops all incoming packets when the queue is full.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### max-burst

Specifies the maximum number of bytes that traffic can burst beyond the value of the rate option. The traffic may not burst higher than the value of the ceiling option. The default value is 0 (zero).

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

##### parent

Associates another class with this class. The class you are configuring (which when you configure a parent class for it becomes a child class) can borrow bandwidth from the parent class. The parent class can use any of the unused bandwidth of the child class.

##### queue

Specifies the queuing method. The default value is sfq. The pre-configured options are:

##### pfifo

The Priority FIFO queuing method queues all traffic under a set of five sub-queues based on the Type of Service (TOS) field of the traffic. Four of the sub-queues correspond to the four possible TOS values (Minimum delay, Maximum

throughput, Maximum reliability, and Minimum cost). The fifth sub-queue represents traffic with no TOS value. The Priority FIFO method processes these five sub-queues in a way that preserves the meaning of the TOS value as much as possible. For example, a packet with the TOS value of Minimum cost might yield dequeuing to a packet with the TOS value of Minimum delay.

sfq Stochastic Fair Queuing is a queuing method that further queues packets under a set of many FIFO sub-queues. Selecting a specific sub-queue is based on a hash of the flow address information. SFQ dequeues packets from the set of sub-queues in a Round Robin fashion. The overall effect is that fairness of dequeuing is achieved, because packets from one flow cannot occupy the queues at the exclusion of those of another flow.

Note that if you assign a shaping policy to the class, then the queuing discipline of the class becomes that specified in the shaping policy. If you do not assign a shaping policy to the class, the default queue is sfq.

rate Specifies the guaranteed throughput rate of the traffic handled by this rate class, in bits per second (bps).

rate-percentage Specifies the rate of the rate class as a percentage of the ceiling of the associated parent class. This option applies only to rate classes with an associated parent rate class. The default value is 0 (zero), which specifies that the system uses the value of the rate option.

regex Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

shaping-policy Specifies the name of a shaping policy. The default value is none.

Note that the system automatically changes the ceiling-percentage, drop-policy, max-burst, queue, and rate-percentage options of this class to match the values in the specified shaping policy.

## net rate-shaping color-policer

#### NAME

color-policer - Configures a policer, which can be applied to other configuration entities to meter or rate-shape traffic using color based classification of packets.

#### MODULE

net rate-shaping

#### SYNTAX

Configure the color-policer component within the net rate-shaping module using the syntax in the following sections.

#### CREATE

```
create color-policer [name]
modify color-policer [name]
options:
  action [action]
  app-service [[string] | none]
  committed-burst-size [integer]
  description [string]
  committed-information-rate [integer]
  excess-burst-size [integer]
```

#### DISPLAY

```
list color-policer
```

options:

all-properties

DELETE  
delete color-policer [name]

#### DESCRIPTION

You can use a color-policer to create a metering/policing configuration to be applied to other configuration entities. For instance, to limit or track out of profile network traffic to a vCMP guest, a color-policer can be added to a vcmp traffic-profile and be applied to any number of vcmp guest objects.

Based on the configuration of color-policer attributes a packet may be counted as either green, yellow, or red. These categories can be tracked for accounting purposes, as well as allowing for out of profile (Red) traffic to be dropped as a rate-shaping or DOS protection technique.

#### EXAMPLES

```
list net color-policer
```

Lists the current configuration of all color-policers.

```
create net color-policer fiftyMbpsLimiter action drop-red committed-  
information-rate 50mbps committed-burst-size 10mb excess-burst-size  
10mb
```

Configures a policer with a committed information rate (CIR) of 50 mbps committed burst size (CBS) of 10 mb, and excess burst size (EBS) of 10 mb. See individual descriptions of options below for more detailed semantics.

#### OPTIONS

action

One of drop-red or default. Drop-red means that a packet which exceeds the excess burst rate of the policer, and is marked red should be dropped immediately before even attempting to enqueue the packet to/from the guest. Default means that the default behavior for the resulting color packets should be taken, which may vary depending on additional system configuration, and load. For instance, a Red colored packet may be considered lowest priority with respect to QOS queues associated with the guest. Thus, allowing as much traffic through as is available, but increasing the drop probability for packets out of profile in the case that the system is under high enough data-plane traffic load.

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

committed-burst-size

When the data rate exceeds the committed-information-rate then the committed-burst-size (by default specified in bytes) is the burst size below which a packet is marked green, and above which it may be marked yellow, or red.

committed-information-rate

The committed rate of data transfer that is to be given to a metered entity that the policer is associated with. Traffic is marked green as long as it stays below this rate or if bursts above this rate are smaller than the committed-burst-size.

description

User defined description.

excess-burst-size

An additional data burst size to be used on top of the committed-burst-size. A packet is marked yellow if it exceeds the committed-burst-size but not the additional excess-burst-size, and red if it exceeds the excess-burst-size.

#### SEE ALSO

## net rate-shaping drop-policy

NAME

drop-policy - Configures a custom drop policy for use in rate shaping.

#### MODULE

net rate-shaping

#### SYNTAX

Configure the drop-policy component within the net rate-shaping module using the syntax in the following sections.

##### CREATE/MODIFY

```
create drop-policy [name]
modify drop-policy [name]
options:
  app-service [[string] | none]
  average-packet-size [integer]
  description [string]
  fred-max-active [integer]
  fred-max-drop [integer]
  fred-min-drop [integer]
  inverse-weight [integer]
  max-probability [integer]
  max-threshold [integer]
  min-threshold [integer]
  red-hard-limit [integer]
  type [fred | red | tail]
```

```
edit drop-policy [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

##### DISPLAY

```
list drop-policy
list drop-policy [ [name] | [glob] | [regex] ] ... ]
show running-config drop-policy
show running-config drop-policy [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

##### DELETE

```
delete drop-policy [all | [name] ]
```

#### DESCRIPTION

A drop policy tells the system when and how to drop packets when the traffic handling queue is full, if required. The system comes with three pre-configured drop policies: fred, red, and tail.

You can use the drop-policy component to create a custom drop policy, and then associate it with a class using the drop-policy option of the class component. For more information, see net rate-shaping class.

You can also associate a custom drop policy with a shaping policy using the drop-policy option of the shaping-policy component. For more information, see net rate-shaping shaping-policy.

#### EXAMPLES

```
create drop-policy my_dp
```

Creates a custom drop policy named my\_dp.

```
list drop-policy all-properties
```

Displays all of the properties of all of the drop policies.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### average-packet-size

Specifies the average MTU (maximum transmission unit) size in the range of 0 to 10000 bytes. The default value is 0 (zero).

##### description

User defined description.

##### fred-max-active

Specifies the maximum number of flows that can be active for each queue. The range is 0 to 10000. The default value is 0 (zero), which disables active flow limitation.

##### fred-max-drop

Specifies a hard drop limit in the range of 0 to 400. The default value is 0 (zero). Setting this to a small value does not change the hard drop limit, but a higher number increases the limit.

##### fred-min-drop

Specifies a hard no drop limit in the range of 0 to 100. The default value is 0 (zero). Setting this to a large value prevents packets from being dropped.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### inverse-weight

Specifies the weight used to calculate the average queue length. Valid values are 0, 64, 128, 256, 512, and 1024. The default value is 0 (zero).

**max-probability**  
Specifies the maximum percentage probability in the range of 0 to 100 according to which packets are dropped when the average queue length is between the minimum and maximum thresholds. The default value is 0 (zero).

**max-threshold**  
Specifies the queue length above which the system drops packets. The default value is 0 (zero).

**min-threshold**  
Specifies the queue length below which the system does not drop packets. The default value is 0 (zero).

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**red-hard-limit**  
Specifies the maximum queue size in bytes. Additional packets are dropped. The default value is 0 (zero).

This option applies only when the value of the type option is red.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**type** Specifies the type of drop policy. The default value is tail.

The options are:

**fred** Specifies that the system uses Flow-based Random Early Detection to decide whether to drop packets based on the aggressiveness of each flow.

**red** Specifies that the system uses Random Early Detection to determine whether to drop packets to maintain the average queue length within the specified range.

**tail** Specifies that the system drops all incoming packets when the queue is full. This is the simplest drop policy.

Note that although you could create a drop policy based on tail, that is already the default value of the drop-policy option in both the shaping-policy and class components.

## net rate-shaping queue

**NAME**  
queue - Configures a custom queuing method.

**MODULE**  
net rate-shaping

**SYNTAX**  
Configure the queue component within the net rate-shaping module using the syntax in the following sections.

**CREATE/MODIFY**  
create queue [pfifo | sfq]  
modify queue [all | pfifo | sfq]  
options:  
app-service [[string] | none]  
description [string]  
pfifo-max-size [integer]  
pfifo-min-size [integer]  
sfq-bucket-count [integer]  
sfq-bucket-size [integer]  
sfq-perturbation [integer]  
type [pfifo | sfq]  
  
edit queue [ [ [all | pfifo | sfq] | [glob] | [regex] ] ... ]  
options:

all-properties  
non-default-properties

#### DISPLAY

list queue  
list queue [ [ [all | pfifo | sfq] | [glob] | [regex] ] ... ]  
show running-config queue  
show running-config queue  
[ [ [all | pfifo | sfq] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line

#### DELETE

delete queue [all | [name] ]

#### DESCRIPTION

You can use the queue component to configure a custom queuing method.

#### EXAMPLES

create queue my\_q type pfifo

Creates a pfifo type queue name my\_q.

list queue all-properties

Displays all of the properties of all of the queue.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

##### pfifo-max-size

Specifies the size of the largest queue for the pfifo type only. The default value is 0 (zero). Valid units are bytes(default), eb, gb, k, kb, mb, pb, and tb.

##### pfifo-min-size

Specifies the size of the smallest queue for the pfifo type only. The default value is 0 (zero). Valid units are bytes(default), eb, gb, k, kb, mb, pb, and tb.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

##### sfq-bucket-count

Specifies the number of buckets into which the queue is divided when you are configuring the sfq type. Valid values are 0, 16, 32, 64, 128, 256, 512, and 1024. The default value is 0 (zero).

##### sfq-bucket-size

Specifies the bucket size for the sfq type. The default value is 0 (zero). Valid units are bytes(default), eb, gb, k, kb, mb, pb, and tb.

##### sfq-perturbation

Specifies the interval in seconds at which the system reconfigures the SFQ hash function. This option applies only to the sfq type. The default value is 0 (zero).

type Specifies the queue discipline this custom queue uses. The options are:

##### pfifo

The Priority FIFO queuing method queues all traffic under a set of five sub-queues based on the Type of Service (TOS) field of the traffic. Four of the sub-queues correspond to the four possible TOS values (Minimum delay, Maximum throughput, Maximum reliability, and Minimum cost). The fifth sub-queue represents traffic with no TOS value. The Priority FIFO method processes these five sub-queues in a way that preserves the meaning of the TOS value as much as possible. For example, a packet with the TOS value of Minimum cost might yield dequeuing to a packet with the TOS value of Minimum delay.

sfq Stochastic Fair Queuing is a queuing method that further queues packets under a set of many FIFO sub-queues. Selecting a specific sub-queue is based on a hash of the flow address information. SFQ dequeues packets from the set of sub-queues in a Round Robin fashion. The overall effect is that fairness of dequeuing is achieved, because packets from one flow cannot occupy the queues at the exclusion of those of another flow.

## net rate-shaping shaping-policy

#### NAME

shaping-policy - Configures a custom rate shaping policy for traffic flow.

#### MODULE

net rate-shaping

#### SYNTAX

Configure the shaping-policy component within the net rate-shaping module using the syntax in the following sections.

##### CREATE/MODIFY

create shaping-policy [name]

modify shaping-policy [name]

##### options:

app-service [[string] | none]

ceiling-percentage [integer]

description [string]

drop-policy [ [name] | none]

max-burst [integer]

queue [ [name] | none]

rate-percentage [integer]

edit shaping-policy [ [ [name] | [glob] | [regex] ] ... ]

##### options:

all-properties

non-default-properties

##### DISPLAY

list shaping-policy

list shaping-policy [ [ [name] | [glob] | [regex] ] ... ]

show running-config shaping-policy

show running-config shaping-policy [ [ [name] | [glob] | [regex] ] ... ]

##### options:

all-properties

non-default-properties

one-line

##### DELETE

delete shaping-policy [all | [name] ]

#### DESCRIPTION

You can use the shaping-policy component to create a custom rate shaping policy to handle traffic flow, and then associate the shaping policy with a class.

Note that if you specify a value for the shaping-policy option of a class, the system automatically changes the ceiling-percentage, drop-policy, max-burst, queue, and rate-percentage options of that class to match the values in the shaping policy.

#### EXAMPLES

```
create shaping-policy my_sp
```

Creates a shaping policy named my\_sp.

```
list shaping policies all-properties
```

Displays all of the properties of all of the shaping policies.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### ceiling-percentage

Specifies the percentage of the value of the ceiling option specified for the parent associated with the class component to which this shaping policy is associated. The default value is 0 (zero).

description  
User defined description.

drop-policy  
Specifies the name of a drop policy for this traffic flow. The default value is none.

You can use one of the pre-configured drop policies, or you can create a customized drop-policy using the drop-policy component.

The pre-configured drop policies are:

fred Specifies that the system uses Flow-based Random Early Detection to decide whether to drop packets based on the aggressiveness of each flow.

red Specifies that the system uses Random Early Detection to determine whether to drop packets to maintain the average queue length within the specified range.

tail Specifies that the system drops all incoming packets when the queue is full. This is the simplest drop policy.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

max-burst  
Specifies the maximum number of bytes that traffic is allowed to burst beyond the value of the rate option of the class component to which this shaping policy is associated. The default value is 0 (zero).

Valid units are byte, bytes(default), eb, gb, k, kb, mb, pb, and tb.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

queue  
Specifies the queuing method for this traffic flow. The default value is none. You can create a customized queuing method using the queue component. For more information, see net rate-shaping queue.

The preconfigured queues are:

pfifo  
The Priority FIFO queuing method queues all traffic under a set of five sub-queues based on the Type of Service (TOS) field of the traffic. Four of the sub-queues correspond to the four possible TOS values (Minimum delay, Maximum throughput, Maximum reliability, and Minimum cost). The fifth sub-queue represents traffic with no TOS value. The Priority FIFO method processes these five sub-queues in a way that preserves the meaning of the TOS value as much as possible. For example, a packet with the TOS value of Minimum cost might yield dequeuing to a packet with the TOS value of Minimum delay.

sfq Stochastic Fair Queuing is a queuing method that further queues packets under a set of many FIFO sub-queues. Selecting a specific sub-queue is based on a hash of the flow address information. SFQ dequeues packets from the set of sub-queues in a Round Robin fashion. The overall effect is that fairness of dequeuing is achieved, because packets from one flow cannot occupy the queues at the exclusion of those of another flow.

rate-percentage  
Specifies the percentage of the value of the rate option of the parent, which is associated with the class component to which this shaping policy is associated, that is available for this traffic flow. The default value is 0 (zero).

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### SEE ALSO

create, delete, edit, glob, list, modify, net rate-shaping drop-policy, net rate-shaping queue, net rate-shaping shaping-policy, regex, show, tmsh

#### COPYRIGHT

## net route-domain

**NAME**  
route-domain - Configures route-domains for traffic management.

**MODULE**  
net

**SYNTAX**  
Configure the route-domain component within the net module using the syntax in the following sections.

**CREATE/MODIFY**  
create route-domain [ [name] | none]  
options:  
id [integer]  
modify route-domain [name]  
options:  
app-service [[string] | none]  
bwc-policy [string]  
connection-limit [integer]  
description [string]  
flow-eviction-policy [ [eviction policy name] | none ]  
fw-enforced-policy [ [policy\_name] | none ]  
fw-staged-policy [ [policy\_name] | none ]  
id [integer]  
parent [ [name] | none]  
security-nat-policy [ [policy\_name] | none]  
service-policy [ [policy\_name] | none ]  
strict [disabled | enabled]  
routing-protocol  
[add | delete | replace-all-with] {  
[protocol name] ...  
}  
vlans  
[add | delete | replace-all-with] {  
[vlan name] ...  
}  
edit route-domain [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
reset-stats route-domain [name]  
fw-enforced-policy-rules { [rule name] }  
fw-staged-policy-rules { [rule name] }  
security-nat-rules { [rule name] }  
options:  
ip-intelligence-categories  
port-misuse  
**DISPLAY**  
list route-domain  
list route-domain [ [name] | [glob] | [regex] ] ... ]  
show running-config route-domain  
show running-config route-domain  
[ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
one-line  
non-default-properties  
show route-domain [ [ [name] | [glob] | [regex] ] ... ]  
options:  
ip-intelligence-categories  
port-misuse  
**DELETE**  
delete route-domain [name]

**DESCRIPTION**  
Using route domains, you can assign the same IP address to more than one device on a network, as long as each instance of the IP address resides in a separate routing domain.

**EXAMPLES**  
create route-domain myRouteDomain id 1 vlans add { my\_vlan }  
  
Creates a route domain named myRouteDomain with an ID of 1 that includes my\_vlan.  
  
list route-domain all-properties  
  
Displays all properties of all route domains.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.  
  
bwc-policy  
Configures the bandwidth control policy for the route-domain. If set, it will enforce a throughput policy for incoming network

traffic.

connection-limit

Configures the connection limit for the route domain. If set to a value other than zero, this specifies the total number of open connections allowed on this route domain. The default value is 0, unlimited.

description

User defined description.

id Specifies a unique numeric identifier for the route-domain. This option is required during creation; it may not be modified once set.

flow-eviction-policy

Specifies a flow eviction policy for the route domain to use, to select which flows to evict when the number of connections approaches the connection limit on the route domain. The default value is none.

fw-enforced-policy

Specifies an enforced firewall policy. fw-enforced-policy rules are enforced on a route-domain.

fw-enforced-policy-rules

Specifies firewall rules enforced on net route-domain via referenced fw-enforced-policy.

fw-staged-policy

Specifies a staged firewall policy. fw-staged-policy rules are not enforced while all the visibility aspects namely statistics, reporting and logging function as if the fw-staged-policy rules were enforced on a route-domain.

fw-staged-policy-rules

Specifies firewall rules staged on net route-domain via referenced fw-staged-policy.

security-nat-rules

Specifies security nat rules associated with net route-domain via referenced security-nat-policy.

parent

Specifies the route domain the system searches when it cannot find a route in the configured domain. The default value is None.

If you specify a parent, during route table lookup, if the system cannot find a route in the current route domain, the system searches routes in the parent route domain. If no route is found in the parent route domain, the system searches the parent route domain's parent, and so on, until the system finds either a match or a parent with a value of None. For example, if rd\_1 has a parent of rd\_0 (in this example, route domain rd\_0 has a parent of None), and you include vlan\_a in rd\_1, when requests arrive for vlan\_a, the system looks in rd\_1 for a route for the specified destination. If no route is found, the system searches route domain 0. If it still cannot find a route, the request for vlan\_a fails. If, using the same example, you set the parent to None, under the same conditions, the system looks in rd\_1, and if it cannot find a matching route, the system refrains from searching any other route domain, the request for vlan\_a fails.

port-misuse

Used to show or reset port misuse policy statistics for the route domain.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

security-nat-policy

Configures the Security NAT Policy (see security nat policy). If specified, this is the NAT policy used to perform first-match classification for incoming traffic to a virtual server if 'the virtual server itself does not have a NAT policy configured AND security-nat-policy.use-route-domain-policy is enabled on the virtual'.

service-policy

Configures the service policy for the route-domain. If set, it will enforce the service policy for incoming network traffic. The service policy can be used to set specific policy based configurations like flow timers, which applies to the flows that matches the policy specification.

strict

Specifies whether the system allows a connection to span route domains. The default value is enabled.

Note: When you enable this option, the system may find invalid iRules(r) that passed validation.

routing-protocol

Specifies routing protocols, by name, for the system to use in the route domain. The default value is none. Dynamic routing must be licensed to use this option.

vlan

Specifies VLANs, by name, for the system to use in the route domain. The default value is none.

ip-intelligence-categories  
Used to show/ reset statistics on IP intelligence white/ black  
lists categories.

## net route

NAME

route - Configures a route for traffic management.

MODULE

net

SYNTAX

Configure the route component within the net module using the syntax in  
the following sections.

CREATE/MODIFY

```
create route [name | ip address/netmask | default | default-inet6]
modify route [name | ip address/netmask | default | default-inet6]
```

options:

```
blackhole
description [string]
gw [ip address]
interface [name]
mtu [integer]
network [ip address/netmask]
pool [name]
```

edit route

```
[ [name | ip address/netmask | default | default-inet6] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
non-default-properties
```

DISPLAY

list route

list route

```
[ [name | ip address/netmask | default | default-inet6] | [glob] | [regex] ] ... ]
```

show running-config route

show running-config route

```
[ [name | ip address/netmask | default | default-inet6] | [glob] | [regex] ] ... ]
```

options:

```
all-properties
mtu
non-default-properties
one-line
partition
```

show route

show route

```
[ [name | ip address/netmask | default | default-inet6] | [glob] | [regex] ] ... ]
```

options:

```
connected
dynamic
field-fmt
lookup [ip address]
static
```

DELETE

```
delete route [name | ip address/netmask | default | default-inet6]
```

DESCRIPTION

You can configure routes for the system, including default routes.

Note that when you use the command edit to create a new route, by  
default the gw (gateway) option is set. If you do not want to use the  
gw option, remove that line of syntax in the editor.

EXAMPLES

```
create route myRoute3 network 12.12.4.0/24 interface external
```

Sets the route myRoute3 to the address 12.12.4.0/24 on the interface  
named external.

```
create route 12.12.3.0/24 gw 10.10.10.254
```

Sets the route to the subnet 12.12.3.0/24 whose gateway IP address is 10.10.10.254.

```
create route default gw 10.10.10.254
```

Sets the default gateway IP address to 10.10.10.254.

```
show route lookup myRoute
```

Displays the route that the system uses to reach the IP address 12.12.3.0.

#### OPTIONS

Note: The options `blackhole`, `gw`, `interface`, and `pool` are mutually exclusive. You can use only one of these options at a time, and you must specify at least one of these options when configuring a route.

##### `blackhole`

Specifies that the system drops traffic that is addressed to the specified destination.

##### `connected`

Displays connected routes.

##### `description`

User defined description.

##### `dynamic`

Displays dynamic routes.

`glob` Displays the items that match the `glob` expression. See `help glob` for a description of `glob` expression syntax.

`gw` Specifies a gateway address for the system.

##### `interface`

Specifies the tunnel, VLAN or VLAN group to which the system sends traffic.

##### `ip address/netmask`

Specifies the destination subnet and mask using CIDR notation, such as 12.12.3.0/24. You can also specify the keyword `default` or `default-inet6`.

##### `lookup`

Displays the route that the system uses to reach the specified IP address. You can specify only a single IP address with the `lookup` option.

`mtu` Sets a specific maximum transition unit (MTU). If you set this option to 0 (zero), the system selects the appropriate MTU for the route, and does not display the MTUs.

##### `network`

Specifies the destination subnet and mask using CIDR notation, such as 12.12.3.0/24. You can also specify the keyword `default` or `default-inet6`.

##### `partition`

Displays the administrative partition within which the route resides.

`pool` Specifies a pool to which the system sends traffic. This allows the system to send traffic to multiple, load-balanced gateways.

##### `regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

##### `static`

Displays static routes.

#### SEE ALSO

`create`, `delete`, `edit`, `glob`, `list`, `ltm pool`, `modify`, `net vlan`, `net vlan-group`, `regex`, `show`, `tmsh`

#### COPYRIGHT

**NAME**  
 router-advertisement - Configures IPv6 prefixes for router advertisement on a VLAN.

**MODULE**  
 net

**SYNTAX**  
 Modify the router-advertisement component within the net module using the syntax shown in the following sections.

**CREATE/MODIFY**  
 create router-advertisement [name]  
 modify router-advertisement [name]  
 options:  
 app-service [[string] | none]  
 current-hop-limit [integer]  
 description [string]  
 disabled | enabled  
 max-interval [integer]  
 min-interval [integer]  
 mtu [integer]  
 no-other-config | other-config  
 prefixes  
 [add | delete | modify | replace-all-with] {  
 [name] ... {  
 app-service [[string] | none]  
 autonomous | not-autonomous  
 description [string]  
 on-link | not-on-link  
 preferred-lifetime [integer]  
 prefix [ip address]  
 prefix-length [integer]  
 valid-lifetime [integer]  
 }  
 }  
 reachable-time [integer]  
 retransmit-timer [integer]  
 router-lifetime [integer]  
 unmanaged | managed  
 vlan [name]

edit router-advertisement [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
 all-properties  
 non-default-properties

**DISPLAY**  
 list router-advertisement  
 list router-advertisement [ [ [name] | [glob] | [regex] ] ... ]  
 show running-config router-advertisement  
 show running-config router-advertisement  
 [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
 all-properties  
 non-default-properties  
 one-line

**DELETE**  
 delete router-advertisement [name]

**DESCRIPTION**  
 Router advertisements are part of the configuration of BIG-IP(r) network components. When creating a router advertisement, you must specify a VLAN on the command line.

**EXAMPLES**  
 create router-advertisement my\_ra vlan my\_vlan  
 Creates the router advertisement my\_ra that includes the VLAN my\_vlan.  
 delete router-advertisement my\_ra  
 Deletes the router advertisement named my\_ra and all associated prefixes.

**OPTIONS**  
 Note the following information regarding options for the router-advertisement component:

- o The options disabled and enabled are mutually exclusive.
- o The options no-other-config and other-config are mutually exclusive.
- o The options unmanaged and managed are mutually exclusive.
- o The options autonomous and not-autonomous are mutually exclusive.
- o The options on-link and not-on-link are mutually exclusive.

**app-service**  
 Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**autonomous**  
 Indicates that the Autonomous Flag field in the prefix information option be set to 1. The default value is 1.

**current-hop-limit**  
Defines the hop limit sent in the router advertisement. The default value is 0 (zero).

**description**  
User defined description.

**disabled**  
Disables router advertisement for the VLAN. This is the default.

**enabled**  
Enables router advertisement for the VLAN.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**managed**  
Indicates that the Managed address configuration flag field in the router advertisement be set to 1.

**max-interval**  
Specifies the maximum time allowed between sending unsolicited multicast Router Advertisements from the interface, in seconds. The default value is 600.

**min-interval**  
Specifies, in seconds, the minimum time allowed between sending unsolicited multicast Router Advertisements from the interface. The default value is 200.

**mtu** Sets a specific maximum transition unit (MTU) for the VLAN. The default value is 0 (zero).

**name** Specifies a unique name for the component. This option is required for the create, delete, and modify commands.

**no-other-config**  
Indicates that the Other Configuration flag field in the router advertisement be set to 0 (zero). The default value is 0 zero.

**not-autonomous**  
Indicates that the Autonomous flag field in the prefix information option be set to 0 (zero).

**not-on-link**  
Indicates that the on-link flag field in the prefix information option be set to 0 (zero).

**on-link**  
Indicates that the on-link flag field in the prefix information option be set to 1. The default value is 1.

**other-config**  
Indicates that the Other Configuration flag field in the router advertisement be set to 1.

**preferred-lifetime**  
Specifies, in seconds, the value for the Preferred Lifetime field in the prefix information option. The default value is 604800.

**prefix**  
Specifies the prefix for the prefix information option.

**prefix-length**  
Specifies the length of the prefix for the prefix information option.

**prefixes**  
Specifies the objects that hold the prefix specific information for the router advertisement.

**reachable-time**  
Specifies the value to be used for the Reachable Time field in the Router Advertisement. The default value is 0 (zero).

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**retransmit-timer**  
Specifies the value to be used for the Retransmit Timer field in the Router Advertisement. The default value is 0 (zero).

**router**  
Specifies that the router advertisement acts as a router for the VLAN.

**router-lifetime**  
Specifies the value to be used for the Router Lifetime field in the Router Advertisement. The default value is 1800.

**unmanaged**  
Specifies that the Managed address configuration flag field in the router advertisement be set to 0 (zero). The default value is 0 (zero).

**valid-lifetime**  
Specifies, in seconds, the value for the Valid Lifetime field in the prefix information option. The default value is 2592000.

## net self-allow

**NAME**  
self-allow - Configures the default "allow list" for all self IP addresses on the BIG-IP(r) system when the option allow-service of the component self is set to default.

**MODULE**  
net

**SYNTAX**  
Modify the self-allow component within the net module using the syntax shown in the following sections.

**MODIFY**  
modify self-allow  
options:  
defaults [all | none]  
defaults  
[add | delete | replace-all-with] {  
[protocol:port] ...  
}

```
edit self-allow
options:
  all-properties

DISPLAY
list self-allow
show running-config self-allow
options:
  all-properties
  defaults
  one-line

DELETE
You cannot delete the default allow list.
```

#### DESCRIPTION

You can use the self-allow component to modify or display the default allow list for all self IP addresses on the BIG-IP system when the option allow-service of the component self is set to default. The default allow list displays which service and protocol ports allow connections from outside the system. The system refuses connections made to a service or protocol port that is not on the list.

#### EXAMPLES

```
modify self-allow defaults all
```

Sets the default allow list to all. Then, if the value of the option allow-service of the net self component is default, the system accepts traffic from all protocol port combinations.

```
modify self-allow default replace-all-with { tcp:55 }
```

Sets the default "allow list" for all self IP addresses on the system to TCP on port 55.

```
list self-allow defaults
```

Displays the default "allow list" for all self IP addresses on the system.

#### OPTIONS

defaults

Specifies to set the default allow list to one of the following:

all Specifies that all protocols and services allow connections from outside the system. Use this option to open the system to complete access.

none Specifies that no protocols or services allow connections from outside the system.

protocol:port

Specifies a list of protocols/services that allow connections from outside the system.

replace-all-with

Specifies to replace the current protocols and services that allow connections from outside the system with the specified protocols and services.

#### SEE ALSO

edit, list, modify, net vlan, net vlan-group, show, tmsh

#### COPYRIGHT

list self
  [ [ [name] | [glob] | [regex] ] ... ]
show running-config self
show running-config self
  [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line

DELETE
delete self [name]

```

#### DESCRIPTION

A self IP address is an IP address that is assigned to the system. Self IP addresses are part of the configuration of the BIG-IP(r) network components. You must define at least one self IP address for each VLAN.

#### EXAMPLES

```
create self mySelf address 10.10.10.24/16 vlan internal
```

Adds the self IP address 10.10.10.24 to the VLAN named internal. This entry is named mySelf. Alternatively, the name can encompass the IP address and mask fields, like the following example.

```
create self 10.10.10.24/16 vlan internal
```

Adds the self IP address 10.10.10.24 to the VLAN named internal.

```
modify self 10.1.1.1/16 vlan external traffic-group
/Common/traffic-group-1
```

Enables a floating IP address on the external VLAN. The traffic-group option makes this virtual address available to whichever device is active on the given traffic-group. In other words, when the standby device becomes the active device for that traffic-group, it uses this virtual address. Only one of the devices in the traffic-group can use the IP address at any given time.

```
mv /net self /Common/10.10.10.15/24 /Common/myselfIP2
```

Moves/Renames the Self IP from 10.10.10.15/24 to myselfIP2.

Note: If you wish to change the name of the self IP, you may use a name that is the same as the IP Address or a name that does not represent a different IP Address than the one configured. If using prefix-length adornment on the name, it must match the existing prefix-length/netmask for the self IP.

Please refer to the mv manual page for additional examples on how to use the mv command.

#### Options

##### allow-service

Specifies the type of protocol/service that the VLAN handles. If you use this property to allow SSH, HTTP, and/or HTTPS service, administrators can use this self-IP address to log into the BIG-IP system; this makes the current self-IP available as a management-IP address on the VLAN.

The options are:

add Adds the specified protocol/service to the VLAN.

all Specifies that the VLAN handles all protocols/services.

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

#### default

Specifies that the system uses a pre-defined set of network protocols/services that are commonly required for BIG-IP deployment. You can customize this set of services with the self-allow component.

This is not the default for the allow-service property; none, described below, is the actual default.

#### delete

Removes the specified protocol/service from the VLAN.

none Specifies that the VLAN handles no protocols/services. This is the default setting for a self IP address.

#### replace-all-with

Replaces the current protocol/service that the VLAN handles with the specified protocol/service.

#### address

Specifies the IP address and netmask to be assigned to the system. This is an optional field. If not specified, the name of the entry must appear in the format [ip address/mask].

#### address-source

Specifies the source of the self IP. This is an optional field. If not specified, the default value of from-user is used.

The options are:

#### from-management

Assigns the self IP with the management IP rather than the provided address or entry name.

#### from-user

Assigns the self IP with the provided address or entry name.

#### description

User-defined description.

#### floating

Read-only property based on the traffic-group. A floating self IP address is a self IP address for a VLAN that serves as a shared address by all devices of a BIG-IP traffic-group.

#### fw-enforced-policy

Specifies an enforced firewall policy. fw-enforced-policy rules are enforced on a self IP address.

#### fw-enforced-policy-rules

Specifies firewall rules enforced on net self via referenced fw-enforced-policy.

#### fw-staged-policy

Specifies a staged firewall policy. fw-staged-policy rules are not enforced while all the visibility aspects namely statistics, reporting and logging function as if the fw-staged-policy rules were enforced on a self IP address.

#### service-policy

Configures the service policy for the self IP address. If set, it will enforce the service policy for incoming network traffic. The service policy can be used to set specific policy based configurations like flow timers, which applies to the flows that matches the policy specification.

#### fw-staged-policy-rules

Specifies firewall rules staged on net self via referenced fw-staged-policy.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

unit Read-only property that specifies the unit in a redundant system. Based on traffic-group.

#### traffic-group

Specifies the traffic group of the self IP address. The default traffic group is traffic-group-local-only, the non-floating traffic-group.

#### inherited-traffic-group

Read-only property that indicates if the traffic-group is inherited from the parent folder.

vlan Specifies the VLAN for which you are setting a self IP address. This option is required.

#### SEE ALSO

create, delete, edit, glob, list, modify, mv, net self-allow, net service-policy, net vlan, net vlan-group, regex, security log profile, show, tmsh

## net service-policy

**NAME**  
service-policy - Configures the service policy.

**MODULE**  
net

**SYNTAX**  
Modify the service policy component within the net module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create service-policy [name]  
modify service-policy [name]  
options:  
description [string]  
port-misuse-policy [[port misuse policy name] | [none]]  
timer-policy [[timer policy name] | [none]]

edit service-policy [[name] | all]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list service-policy  
show running-config service-policy  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
service-policy configuration allows one to specify certain properties that would apply to a flow. Service policy consists of other policy objects like timer policy and port misuse policy objects. The policy can be applied at different contexts, like Global context, virtual server context, route domain context, self-ip context, or a firewall rule. When a service policy is configured both at a context level, as well as on a firewall rule, and a flow matches the rule, the more specific service-policy configuration in the rule will override the service policy setting at the context level. You can use the service-policy component to configure a shareable and reusable set of network service policies which can be associated with a number of configuration objects of the following types: net self, net route-domain, security firewall policy rules, security firewall rule-list rules, ltm virtual. Port misuse policy object is not effective with net self context.

**EXAMPLES**  
create net service-policy flow-policy timer-policy idle-flow-policy

list service-policy  
net service-policy flow-policy {  
timer-policy idle-flow-policy  
}

Creates service policy and associates a timer policy configuration object. (see "net timer-policy").

modify net service-policy flow-policy port-misuse-policy tcp-port-policy

list service-policy  
net service-policy flow-policy {  
timer-policy idle-flow-policy  
port-misuse-policy tcp-port-policy  
}

Associates a port misuse policy with service policy. (see "security firewall port-misuse-policy").

list service-policy

Displays the current service policy configuration.

**OPTIONS**  
description  
User defined description.

port-misuse-policy  
Specify service port misuse policy.

timer-policy

Specify service timer policy.

SEE ALSO

create, edit, list, modify, security firewall rule-list, security firewall policy, net timer-policy, security firewall port-misuse-policy, tmsh

## net stp-globals

NAME

stp-globals - Configures spanning tree protocols on the system.

MODULE

net

SYNTAX

Configure the stp-globals component within the net module using the syntax shown in the following sections.

MODIFY

modify stp-globals

options:

config-name [configuration name]  
config-revision [integer]  
description [string]  
fwd-delay [integer]  
hello-time [integer]  
max-age [integer]  
max-hops [integer]  
mode [disabled | mstp | passthru | rstp | stp]  
transmit-hold [integer]

edit stp-globals

options:

all-properties  
non-default-properties

DISPLAY

list stp-globals

show running-config stp-globals

options:

all-properties  
non-default-properties  
one-line

DESCRIPTION

Provides the ability to configure spanning tree protocols for the traffic management system. Spanning tree protocols are Layer 2 protocols for preventing bridging loops. The system supports multiple spanning tree protocol (MSTP), rapid spanning tree protocol (RSTP), and spanning tree protocol (STP).

EXAMPLES

modify stp-globals mode passthru

Sets the STP mode to passthru. Passthru mode forwards spanning tree bridge protocol data units (BPDUs) received on any interface to all other interfaces.

modify stp-globals mode disabled

Sets the STP mode to disabled. No MSTP, RSTP, or STP packets are transmitted or received on the interface or trunk, and the spanning tree algorithm exerts no control over forwarding or learning on the port or the trunk.

OPTIONS

config-name

Specifies the configuration name (1 - 32 characters in length) only when the spanning tree mode is MSTP. The default configuration name is a string representation of a globally unique MAC address belonging to the traffic management system.

The MSTP standard introduces the concept of spanning tree regions, which are groups of adjacent bridges with identical configuration names, configuration revision levels, and assignments of VLANs to spanning tree instances.

Note: The system default configuration name is a string representation of the globally unique MAC address of the traffic

management system in which hyphens replace the colons in the standard MAC address. For example, the default configuration name 00-01-D7-68-11-80, represents the MAC address 00:01:D7:68:11:80.

#### config-revision

Specifies the revision level of the MSTP configuration only when the value of the mode option is mstp. The specified number must be in the range 0 through 65535. The default value is 0 (zero).

#### description

User defined description.

#### fwd-delay

In the original STP, the forward delay parameter controlled the number of seconds for which an interface was blocked from forwarding network traffic after a reconfiguration of the spanning tree topology. This parameter has no effect when RSTP or MSTP are used, as long as all bridges in the spanning tree use the RSTP or MSTP protocol. If any legacy STP bridges are present, then neighboring bridges must fall back to the old protocol, whose reconfiguration time is affected by the value of the fwd-delay option. The default value is 15 seconds, and the valid range is 4 to 30.

#### hello-time

Specifies the time interval in seconds between the periodic transmissions that communicate spanning tree information to the adjacent bridges in the network. The default value is 2 seconds, and the valid range is 1 - 10. The default value is optimal in virtually all cases. F5 Networks recommends that you do not change the value of the hello-time option.

#### max-age

Specifies the number of seconds for which spanning tree information received from other bridges is considered valid. The default value is 20 seconds, and the valid range is 6-40 seconds.

#### max-hops

Specifies the maximum number of hops an MSTP packet can travel before it is discarded. Use this option only when the value of the mode option is mstp. The number of hops must be in the range of 1 to 255 hops. The default number of hops is 20.

mode Specifies one of three spanning tree modes:

#### disabled

Specifies to discard spanning tree bridge protocol data units (BPDUs) received on any interface.

mstp Specifies multiple spanning tree protocol.

#### passthru

Forwards spanning tree bridge protocol data units (BPDUs) received on any interface to all other interfaces. Essentially, passthru mode makes the traffic management system transparent to spanning tree BPDUs. This is the system default.

rstp Specifies rapid spanning tree protocol (RSTP) converges to a fully-connected state quickly.

stp The system supports STP mode for legacy systems. If STP is detected in the network, the traffic management system changes to STP mode even when the mode option is set to disabled, mstp, or rstp.

#### transmit hold

Specifies the absolute limit on the number of spanning tree protocol packets the traffic management system may transmit on a port in any hello-time interval. It is used to ensure that spanning tree packets do not unduly load the network even in unstable situations. The default value is 6 packets, and the valid range is 1 through 10 packets.

#### SEE ALSO

BIG-IP 2016-03-14 net stp-globals(1)

NAME  
stp - Configures a Spanning Tree Protocol (STP) instance.

MODULE  
net

SYNTAX  
Configure the stp component within the net module using the syntax shown in the following sections.

```

CREATE/MODIFY
create stp [all | [name] ]
modify stp [all | [name] ]
options:
  app-service [[string] | none]
  description [string]
  instance-id [integer]
  interfaces [ add | delete | modify | replace-all-with ] {
    [interface name] {
      options:
        app-service [[string] | none]
        external-path-cost [integer]
        internal-path-cost [integer]
        priority [integer]
      }
    }
  interfaces none
  priority [integer]
  trunks [ add | delete | modify | replace-all-with ] {
    [interface name] {
      options:
        app-service [[string] | none]
        external-path-cost [integer]
        internal-path-cost [integer]
        priority [integer]
      }
    }
  trunks none
  vlans [ add | delete | replace-all-with ] {
    [vlan name ...]
  }
  vlans none

edit stp [ [ all | [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list stp
list stp [ [ all | [name] | [glob] | [regex] ] ... ]
show stp running-config
show stp running-config [ [ all | [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line

DELETE
delete stp [all | [name] ]

```

DESCRIPTION  
You can use the stp component to configure an STP instance.

EXAMPLES

```
list stp
```

Displays all STP instances on the system.

```
show running-config stp
```

Displays the running configuration information for all STP instances.

```
delete stp myStp2
```

Removes all members from the STP instance, and then deletes the instance itself.

Note that you cannot delete spanning tree instance 0 (the Common and Internal Spanning Tree). You can only use the command delete in Multiple Spanning Tree Protocol (MSTP) mode.

OPTIONS

app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

description  
User defined description.

external-path-cost  
Specifies the external path cost number for either an interface or trunk. The default value is 20000.

Each network interface has an associated path cost within each spanning tree instance. The path cost represents the relative cost of sending network traffic through that interface. In calculating the spanning tree, the algorithm tries to minimize the total path cost between each point of the tree and the root bridge. By manipulating the path costs of different interfaces or trunks it

is possible to steer traffic toward paths that are faster, more reliable, and/or more economical. Path costs can take values in the range 1 - 200,000,000. The default path cost for an interface or a trunk is based on the maximum, not actual speed, of the interface or trunk.

In MSTP mode there are two kinds of path cost: external and internal. The external path cost applies only to spanning tree instance 0, the Common and Internal Spanning Tree (CIST). It is used to calculate the cost to reach an adjacent spanning tree region.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### instance-id

The instance ID for this STP instance. In Multiple Spanning Tree Protocol (MSTP) mode, there will be exactly one STP instance with ID 0. The instance ID can be a value between 1 and 255.

#### internal-path-cost

Specifies the internal path cost number for either an interface or trunk. The default value is 20000.

Each network interface has an associated path cost within each spanning tree instance. The path cost represents the relative cost of sending network traffic through that interface. In calculating the spanning tree, the algorithm tries to minimize the total path cost between each point of the tree and the root bridge. By manipulating the path costs of different interfaces or trunks it is possible to steer traffic toward paths that are faster, more reliable, and/or more economical. Path costs can take values in the range 1 - 200,000,000. The default path cost for an interface or a trunk is based on the maximum, not actual speed, of the interface or trunk.

In MSTP mode there are two kinds of path cost: external and internal. The internal path costs can be independently set for each spanning tree instance (including instance 0) in MSTP mode. The internal path costs are used to calculate the costs of reaching adjacent bridges within the same spanning tree region.

#### priority

Specifies the priority number of either a bridge, interface, or trunk. The default value for a bridge is 61440. The default value for both interfaces and trunks is 128.

Each bridge, interface, and trunk in a spanning tree instance has a priority value. The relative values of the priorities control the topology of the spanning tree chosen by the protocol. The bridge with the lowest priority value (numerically) will become the root of the spanning tree. Priority values vary from 0 - 61440 in steps of 4096.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### vlan

Specifies the VLANs that you want to add to, delete from, or replace-all-with for this STP instance.

#### SEE ALSO

create, delete, edit, glob, list, modify, net interface, net trunk, net vlan, regex, show, tmsh

#### COPYRIGHT

## net timer-policy

#### NAME

timer-policy - Configures the timer policy.

#### MODULE

net

#### SYNTAX

Modify the timer policy component within the net module using the syntax shown in the following sections. A timer-policy is attached to a

service-policy and applied either through an ACL rule or policy applied on a context. The list of supported contexts where a timer policy can be applied are: Virtual Server, SelfIP, Route Domain and Global. The precedence of the timer policy is as follows (highest precedence is 1):

1. ACL rule configured on a Virtual Server or SelfIP
2. Policy configured on a Virtual Server or SelfIP
3. ACL rule configured on a Route Domain
4. Policy configured on a Route Domain
5. ACL rule configured through Global Rules
6. Policy configured on Global Service Policy

Note that within the same context, ACL rule based service policy takes first precedence. Among the different contexts, the order of precedence is as follows: Virtual Server, SelfIP, Route Domain, Global.

```
CREATE/MODIFY
create timer-policy [name]
modify timer-policy [name]
options:
  description [string]
  rules [add | delete | modify | replace-all-with] {
    [ [rule name] ] {
options:
  description [string]
  destination-ports [add | delete | replace-all-with] {
    [ [port] | [port1-port2] ]
  }
  destination-ports none
  ip-protocol [protocol name]
  timers [add | delete | modify | replace-all-with] {
    [ [flow timer type] ] {
value [timeout]
  }
  }
  timers none
  }
  rules none

edit timer-policy [[name] | all]
options:
  all-properties
  non-default-properties

DISPLAY
list timer-policy
show running-config timer-policy
options:
  all-properties
  non-default-properties
  one-line
```

**DESCRIPTION**  
You can use the timer-policy component to configure a shareable and reusable set of network timer policies which can be associated with a service policy object.

**EXAMPLES**  
create net timer-policy add idle-flow-policy { rules add { r1 { ip-protocol tcp destination-ports add { 80 8080 } timers add { flow-idle-timeout { value 120 } } } } r2 { ip-protocol udp destination-ports add { 7878 } timers add { flow-idle-timeout { value 300 } } } }

```
list timer-policy
net timer-policy {
  idle-flow-policy {
  rules {
    r1 {
  ip-protocol tcp
  destination-ports {
    http { }
    webcache { }
  }
  timers {
    flow-idle-timeout {
  value 120
  }
  }
  }
    r2 {
  ip-protocol udp
  destination-ports {
    7878 { }
  }
  timers {
    flow-idle-timeout {
  value 300
  }
  }
  }
  }
}
```

Creates timer policy rules to set specific timeout configuration for tcp ports 80 & 8080 traffic and another entry for protocol udp.

Here is another example to illustrate the rule match behavior for policy with rules configured with 'all-other' for destination-ports and ip-protocol. Consider a policy as listed below.

```
list timer-policy
net timer-policy {
```

```

    flow-idle-policy {
rules {
    r1 {
ip-protocol tcp
destination-ports {
    all-other { }
}
timers {
    flow-idle-timeout {
value 120
}
}
}
    r2 {
ip-protocol udp
destination-ports {
    9090 { }
}
timers {
    flow-idle-timeout {
value 300
}
}
}
    r3 {
ip-protocol all-other
destination-ports {
    all-other { }
}
timers {
    flow-idle-timeout {
value 40
}
}
}
}
}
}

```

For an incoming flow:-

- a) TCP, any port: Matches rule r1
- b) UDP, port 1010: Matches no rule
- c) ICMP: Matches rule r3

For the above policy, since there is a specific UDP rule for port 9090, a UDP flow with port other than 9090 will not match any rule. If the rule r2 were to be deleted, all UDP traffic will match against the 'all-other' ip-protocol rule r3.

If the user would like to apply a specific timeout for UDP traffic with destination port being anything other than 9090, one can enter rule r4 to the above policy:

```

    r4 {
ip-protocol udp
destination-ports {
    all-other { }
}
timers {
    flow-idle-timeout {
value 60
}
}
}
}

```

```
modify timer-policy idle-flow-policy delete r1
```

Removes the timer policy rule r1.

```
list timer-policy
```

Displays the current timer policy configuration list.

#### OPTIONS

**description**  
User defined description.

**rules**  
Adds, deletes, or replaces a named timer policy rule.

**ip-protocol**  
Specifies the IP protocol entry for which the timer policy rule is being configured. This could be a layer-4 protocol (such as tcp, udp or sctp). Only flows matching the configured protocol will make use of this rule. Press the key for a full list of valid protocols. Keyword 'all-other' as an ip-protocol entry means, if there are no specific ip-protocol rule that matches the flow, the flow then matches the 'all-other' ip-protocol rule. Please see example above for rule match behavior.

**destination-ports**  
Specifies the destination port or port range to match against the flow. Keyword 'all-other' as a port entry means, if there are no specific port entry rules to match against the flow, the flow then matches the 'all-other' port rule. For eg. if a policy consists of just two rules r1 and r2, with the same protocol 'tcp' but destination port 80 for r1 and port 'all-other' for r2 configured, an incoming flow with port 80 will match r1 and incoming flow with port 9090 will match r2. Without the 'all-other' port rule r2, incoming flow with port 9090 will not match any rule.

**timers**

Specifies the flow timer configuration for the different timer types.

value  
Specifies the timeout value in seconds.

DELETE  
delete trunk [all | [name]]

DESCRIPTION

Link Aggregation allows multiple physical links to be treated as one logical link. It is also referred to as trunking.

The main objective of link aggregation is to provide increased

bandwidth at a lower cost, without having to upgrade hardware. The bandwidth of the aggregated trunk is the sum of the capacity of individual member links. Thus, it provides an option for linearly incremental bandwidth as opposed to bandwidth options available through physical layer technology. The traffic management system supports link aggregation control protocol (LACP).

When a trunk is created, LACP is disabled by default. In this mode, no control packets are exchanged and the member links carry traffic as long as the physical layer is operational. In the event of physical link failure, an LACP member is removed from the aggregation.

Note that both endpoints of the trunk should have identical LACP configuration to work properly. A mixed configuration where one endpoint is LACP enabled and the other is LACP disabled, is not valid.

#### EXAMPLES

```
create trunk my_trunk interfaces add {1.1 1.2 1.3}
```

Creates a trunk named my\_trunk that includes the interfaces 1.1, 1.2, and 1.3.

```
modify trunk my_trunk lacp enabled
```

Enable LACP on the trunk named my\_trunk.

```
modify trunk my_trunk lacp-mode active
```

Enable active LACP mode on the trunk my\_trunk.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### bandwidth

Specifies the operation bandwidth in bytes per second.

##### cfg-mbr-count

Displays the number of configured members that are associated with this trunk.

##### description

User defined description.

##### distribution-hash

Specifies the basis for the hash that the system uses as the frame distribution algorithm. The system uses the resulting hash to determine which interface to use for forwarding traffic.

When frames are transmitted on a trunk, they are distributed across the working member links. The distribution function ensures that the frames belonging to a particular conversation are neither mis-ordered nor duplicated at the receiving end. Distribution is done by calculating a hash value based on source and destination addresses carried in the frame and associating the hash value with a link. All frames with a particular hash value are transmitted on the same link, thereby maintaining frame order.

The options are:

##### dst-mac

Uses the destination MAC addresses to calculate the hash value.

##### src-dst-mac

Uses the source, destination, and MAC addresses to calculate the hash value.

##### src-dst-ipport

Uses the source and destination IP addresses and ports to calculate the hash value.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**id** Displays the ID of the trunk.

##### interfaces

Specifies the interfaces by name separated by spaces that you want to add to the trunk, delete from the trunk, or with which you want to replace all existing interfaces associated with the trunk.

**lacp** Specifies, when enabled, that the system supports the link aggregation control protocol (LACP), which monitors the trunk by exchanging control packets over the member links to determine the health of the links. If LACP detects a failure in a member link, it removes the link from the link aggregation. LACP is disabled by default, for backward compatibility.

##### lacp-mode

Specifies the operation mode for LACP if the lacp option is enabled for the trunk. The options are:

##### active

Specifies that the system periodically transmits LACP packets, regardless of the control value of the peer system.

##### passive

Specifies that the system periodically transmits LACP packets, unless the control value of the peer system is

active.

**lACP-timeout**  
Specifies the rate at which the system sends the LACP control packets. The default value is long.

The options are:

**long** Specifies that the system exchanges LACP packets every 30 seconds.

**short**  
Specifies that the system exchanges LACP packets every second.

**link-select-policy**  
Sets the LACP policy that the trunk uses to determine which member link (interface) can handle new traffic.

Link aggregation is allowed only when all the interfaces are operating at the same media speed and connected to the same partner aggregation system. When there is a mismatch among configured members due to configuration errors or topology changes (auto-negotiation), link selection policy determines which links become working members and form the aggregation.

The options are:

**auto** Specifies that the system chooses the lowest numbered operational link as the reference link. All the members that have the same media speed and are connected to the same partner as that of the reference link are declared as working members, and they are aggregated. The other configured members do not carry traffic.

**maximum-bandwidth**  
Specifies that the system adds to the aggregation a subset of links that gives maximum aggregate bandwidth to the trunk.

**mac-address**  
Specifies the media access control (MAC) address, which is associated with the trunk, in not case-sensitive hexadecimal colon notation, for example, 00:0b:09:88:00:9a.

**media**  
Displays the media settings for the trunk.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**stp** Enables or disables spanning tree protocols (STP). The default value is enabled.

If you disable STP, the system does not transmit or receive STP, RSTP, or MSTP packets on the trunk, and STP has no control over forwarding or learning on the trunk.

**stp-reset**  
Resets STP, which forces a migration check.

**qinq-ethertype**  
Specifies the ether-type value used for the packets handled on this trunk when it is a member in a QinQ vlan. The ether-type can be set to any string containing a valid hexadecimal 16 bits number, or any of the well known ether-types: 0x8100, 0x9100, 0x88a8. Default value is set to 0x8100.

**working-mbr-count**  
Displays the number of working members associated with this trunk.

NAME etherip - Configures an EtherIP tunnel profile.

MODULE net tunnels

SYNTAX Configure the etherip component within the net tunnels module using the syntax in the following sections.

CREATE/MODIFY

```
create etherip [name]
modify etherip [name]
options:
  app-service [[string] | none]
  defaults-from [name]
  description [string]
```

edit etherip [ [ [name] | [glob] | [regex] ] ... ]

```
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list etherip
list etherip [ [ [name] | [glob] | [regex] ] ... ]
show running-config etherip
show running-config etherip [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition
```

DELETE

```
delete etherip [ all | [name] ]
```

DESCRIPTION

You can use the etherip component to create an EtherIP profile that you associate with a tunnel using the tunnel component. This will cause ethernet frames to be sent over the tunnel. For more information about creating a tunnel see net tunnel.

EXAMPLES

```
create etherip my_etherip
```

Creates an EtherIP profile called my\_etherip.

```
list etherip all-properties
```

Displays all of the properties of all EtherIP profiles.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is etherip.

description

User defined description.

glob

Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name

Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which this component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO

create, delete, edit, glob, list, modify, net tunnels tunnel, regex, show, tmsh

## net tunnels fec-stat

**NAME**  
fec-stat - Displays FEC tunnels statistics.

**MODULE**  
net tunnels

**SYNTAX**  
Display statistics for the FEC tunnels using the syntax in the following section.

**DISPLAY**  
show action  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the fec-stat component to display FEC tunnels statistics. The statistics details are described below:

**name** Specifies the FEC tunnel name.

**profile**  
Specifies the FEC profile name used for the tunnel.

**out\_raw\_packets**  
Specifies the number of FEC outgoing raw packets coming from the LAN.

**out-raw-bits**  
Specifies the number of FEC outgoing raw bits coming from the LAN.

**out\_rdnd\_packets**  
Specifies the number of FEC outgoing redundant packets sent to the WAN.

**out\_rdnd\_bits**  
Specifies the number of FEC outgoing redundant bits sent to the WAN.

**in\_raw\_packets**  
Specifies the number of incoming raw packets sent to the LAN.

**in-raw-bits**  
Specifies the number of incoming raw bits sent to the LAN.

**in\_rdnd\_packets**  
Specifies the number of FEC redundant packets incoming from the WAN.

**in\_rdnd\_bits**  
Specifies the number of FEC redundant bits incoming from the WAN.

**in\_rdnd\_lost**  
Specifies the number of FEC redundant packets lost incoming from the WAN.

**in\_raw\_lost**  
Specifies the number of incoming from WAN raw packets lost.

**rmt\_in\_rdnd\_packets**  
Specifies the number of FEC redundant packets from a remote server when incoming from the WAN.

**rmt\_in\_raw\_packets**  
Specifies the number of raw packets from remote a server when incoming from the WAN.

**rmt\_in\_rdnd\_lost**  
Specifies the number of FEC redundant packets lost from a remote server when incoming from the WAN.

**rmt\_in\_raw\_lost**  
Specifies the number of raw packets lost from a remote server when incoming from the WAN.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, fec, net tunnels, net tunnels fec, net tunnels tunnel, tmsh

**COPYRIGHT**

## net tunnels fec

**NAME**  
fec - Configures a Forward Error Correction (FEC) profile.

**MODULE**  
net tunnels

**SYNTAX**  
Configure the fec component within the net tunnels module using the syntax in the following sections.

**CREATE/MODIFY**  
create fec [name]  
modify fec [name]  
options:  
app-service [[string] | none]  
decode-idle-timeout [integer]  
decode-max-packets [integer]  
decode-queues [integer]  
defaults-from [name]  
description [string]  
encode-max-delay [integer]  
keepalive-interval [integer]  
lzo [disabled | enabled]  
repair-adaptive [disabled | enabled]  
repair-packets [integer]  
source-adaptive [disabled | enabled]  
source-packets [integer]  
udp-port [integer]

edit fec [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
=head2 DISPLAY

list fec  
list fec [ [name] | [glob] | [regex] ] ... ]  
show running-config fec  
show running-config fec [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
app-service  
non-default-properties  
one-line  
partition

**DELETE**  
delete fec [ all | [name] ]

**DESCRIPTION**  
You can use the fec component to create a FEC profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

**EXAMPLES**  
create fec my\_fec  
Creates a FEC profile called my\_fec.  
list fec all-properties  
Displays all of the properties of all of the FEC profiles.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.  
defaults-from  
Specifies the existing profile from which the system imports settings for the new profile. The default value is fec.  
description  
User defined description.  
glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.  
name Specifies a unique name for the component. This option is required for the commands create and modify.  
partition  
Displays the administrative partition within which this component resides.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### decode-idle-timeout

Specifies the maximum waiting time for packets in decoding queues. Packets waiting longer than this time are discarded. Range is from 250 to 2000 milliseconds. The default value is 1500 milliseconds.

#### decode-max-packets

Specifies the maximum number of waiting packets in decoding queues. Range is from 200 to 8000. The default value is 512.

#### decode-queues

Specifies the number of decoding queues. Valid numbers are 8,16,32,64,128,256,512,1024. The default value is 32.

#### encode-max-delay

Specifies the maximum waiting time for packet aggregation. Range is from 500 to 5000 microseconds. The default value is 500 microseconds.

#### keepalive-interval

Specifies the interval between keepalive (statistical data) packets. Range is from 0 to 100 seconds. The default value is 5 seconds.

**lzo** Controls the use of the LZ0 compression algorithm to compress data packets. The default value is enabled.

#### repair-adaptive

Controls the use of the adaptive FEC repair technique to modify the number of redundant packets according to actual network conditions. The default value is enabled.

#### repair-packets

Specifies the number of redundant packets to add. Range is from 0 to 15. The default value is 15. This value should be less than or equal to the value specified for source-packets.

#### source-adaptive

Controls the use of the adaptive FEC source packets technique to reduce the number of packets for better MTU usage. The default value is enabled.

#### source-packets

Specifies the number of packets into which the system divides the aggregated payload. Range is from 1 to 15. The default value is 15.

#### udp-port

Specifies the local port for receiving FEC packets. The default value is 8288.

## net tunnels geneve

#### NAME

geneve - Configures a Geneve profile.

#### MODULE

net tunnels

#### SYNTAX

Configure the geneve component within the net tunnels module using the syntax in the following sections.

#### CREATE/MODIFY

create geneve [name]

modify geneve [name]

#### options:

app-service [[string] | none]

defaults-from [ [name] | none]

description [string]

```

port [integer]
flooding-type [none | multicast | multipoint]

edit geneve [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list geneve
list geneve [ [ [name] | [glob] | [regex] ] ... ]
show running-config geneve
show running-config geneve [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

DELETE
delete geneve [ all | [name] ]

DESCRIPTION
You can use the geneve component to create a geneve profile that you
associate with a tunnel using the tunnel component. For more
information about creating a tunnel see net tunnel.

EXAMPLES
create geneve my_geneve

Creates a geneve profile called my_geneve.

list geneve all-properties

Displays all the properties of all the geneve profiles.

OPTIONS
app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

defaults-from
Specifies the existing profile from which the system imports
settings for the new profile. The default value is geneve.

description
User defined description.

glob Displays the items that match the glob expression. See help glob
for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required
for the commands create and modify.

partition
Displays the administrative partition within which this component
resides.

port Specifies the local port for receiving geneve packets. The default
is 6081.

flooding-type
Specifies the flooding type to use to transmit multicast,
broadcast and unknown destination frames. The default is
multipoint.

regex
Displays the items that match the regular expression. The regular
expression must be preceded by an at sign (@[regular expression])
to indicate that the identifier is a regular expression. See help
regex for a description of regular expression syntax.

SEE ALSO
create, delete, edit, glob, list, modify, net tunnels tunnel, regex,
show, tmsh

BIG-IP 2016-03-14 net tunnels geneve(1)

**NAME**  
gre - Configures a Generic Router Encapsulation (GRE) profile.

**MODULE**  
net tunnels

**SYNTAX**  
Configure the gre component within the net tunnels module using the syntax in the following sections.

**CREATE/MODIFY**  
create gre [name]  
modify gre [name]  
options:  
  app-service [[string] | none]  
  defaults-from [name]  
  description [string]  
  rx-csum [disabled | enabled]  
  tx-csum [disabled | enabled]  
  encapsulation [standard | nvgre]  
  flooding-type [none | multipoint]

edit gre [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  non-default-properties

**DISPLAY**  
list gre  
list gre [ [name] | [glob] | [regex] ] ... ]  
show running-config gre  
show running-config gre [ [name] | [glob] | [regex] ] ... ]  
options:  
  all-properties  
  app-service  
  non-default-properties  
  one-line  
  partition

**DELETE**  
delete gre [ all | [name] ]

**DESCRIPTION**  
You can use the gre component to create a GRE profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

**EXAMPLES**  
create gre my\_gre  
  
Creates a GRE profile called my\_gre.  
  
list gre all-properties  
  
Displays all of the properties of all of the GRE profiles.

**OPTIONS**  
**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**defaults-from**  
Specifies the existing profile from which the system imports settings for the new profile. The default value is gre.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create and modify.

**partition**  
Displays the administrative partition within which this component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**rx-csum**  
Specifies whether the system verifies the checksum on received packets. The default value is disabled.

**tx-csum**  
Specifies whether the system includes a checksum on transmitted packets. The default value is disabled.

**encapsulation**  
Specifies the flavor of GRE header to use for encapsulation. The default value is standard.

**flooding-type**  
Specifies the flooding type to use to transmit broadcast and unknown destination frames. The default is none.

## net tunnels ipip

### NAME

ipip - Configures an IP over IP (IPIP) profile.

### MODULE

net tunnels

### SYNTAX

Configure the ipip component within the net tunnels module using the syntax in the following sections.

#### CREATE/MODIFY

```
create ipip [name]
modify ipip [name]
options:
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  proto [IPv4 | IPv6]
  ds-lite [bool]
```

```
edit ipip [ [ [name] | [glob] | [regex] ] ... ]
```

#### options:

```
all-properties
non-default-properties
```

#### DISPLAY

```
list ipip
list ipip [ [ [name] | [glob] | [regex] ] ... ]
show running-config ipip
show running-config ipip [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition
```

#### DELETE

```
delete ipip [ all | [name] ]
```

### DESCRIPTION

You can use the ipip component to create an IPIP profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

### EXAMPLES

```
create ipip my_ipip
```

Creates an IPIP profile called my\_ipip.

```
list ipip all-properties
```

Displays all of the properties of all of the IPIP profiles.

### OPTIONS

#### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

#### defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is ipip.

#### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required

for the commands create and modify.

**partition**  
Displays the partition within which this component resides.

**proto**  
Specifies the next header protocol. The default value is IPv4.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**ds-lite**  
Specifies whether the profile is used for a DS-lite deployment. When enabled, an augmented flow lookup is made using the IPv6 address in the outer header in addition to the inner header addresses for packets coming over this tunnel. The default value is disabled.

SEE ALSO

create, delete, edit, glob, list, modify, net tunnels gre, net tunnels tunnel, net tunnels wccp, regex, show, tmsh

## net tunnels ipsec

**NAME**  
ipsec - Configures an IPsec profile.

**MODULE**  
net tunnels

**SYNTAX**  
Configure the ipsec component within the net tunnels module using the syntax in the following sections.

**CREATE/MODIFY**  
create ipsec [name]  
modify ipsec [name]  
options:  
app-service [[string] | none]  
defaults-from [ [name] | none]  
description [string]  
traffic-selector [name]

edit ipsec [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list ipsec  
list ipsec [ [ [name] | [glob] | [regex] ] ... ]  
show running-config ipsec  
show running-config ipsec [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
app-service  
non-default-properties  
one-line  
partition

**DELETE**  
delete ipsec [ all | [name] ]

**DESCRIPTION**

You can use the ipsec component to create an ipsec profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

**EXAMPLES**

create ipsec my\_ipsec

Creates an IPsec profile called my\_ipsec.

list ipsec all-properties

Displays all the properties of all the IPsec profiles.

## OPTIONS

### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

### defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is ipsec.

### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

### partition

Displays the administrative partition within which this component resides.

### traffic-selector

Specifies the IPsec traffic selector for the IPsec tunnel.

### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

## SEE ALSO

create, delete, edit, glob, list, modify, net tunnels tunnel, regex, show, tmsb

## COPYRIGHT

## net tunnels lw4o6

### NAME

lw4o6 - Configures a LW4o6 tunnel profile.

### MODULE

net tunnels

### SYNTAX

Configure the lw4o6 component within the net tunnels module using the syntax in the following sections.

#### CREATE/MODIFY

create lw4o6 [name]

modify lw4o6 [name]

#### options:

app-service [[string] | none]

defaults-from [ [name] | none]

description [string]

lwtbl-file [string]

psid-length [integer]

all-protocols-pass [enabled | disabled]

edit lw4o6 [ [ [name] | [glob] | [regex] ] ... ]

#### options:

all-properties

non-default-properties

#### DISPLAY

list lw4o6

list lw4o6 [ [ [name] | [glob] | [regex] ] ... ]

show running-config lw4o6

show running-config lw4o6 [ [ [name] | [glob] | [regex] ] ... ]

#### options:

all-properties

app-service

non-default-properties

one-line

partition

#### DELETE

delete lw4o6 [ all | [name] ]

## DESCRIPTION

You can use the lw4o6 component to create a LW4o6 profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

## EXAMPLES

```
create lw4o6 my_lw4o6 lwtbl-file name
```

Creates a LW4o6 profile called my\_lw4o6, lwtbl-file name have to be created before. For more information about creating a lwtbl-file see sys file lwtunneiltbl.

```
list lw4o6 all-properties
```

Displays all the properties of all the LW4o6 profiles.

## OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is lw4o6.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which this component resides.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

lwtbl-file

Specifies the existing lw4o6 configuration file.

psid-length

Specifies the length of Port Set ID (PSID). The default value is 0.

all-protocols-pass

When enabled and PSID is 0, permits passthrough for all IP sub-protocols. If PSID != 0, value have to be disabled. If it is disabled only TCP/UDP/ICMP traffic can pass lw4o6 tunnel. The default value is disabled."

## SEE ALSO

create, delete, edit, glob, list, modify, net tunnels tunnel, regex, show, tmsh

## net tunnels map

### NAME

map - Configures a MAP tunnel profile.

### MODULE

net tunnels

### SYNTAX

Configure the map component within the net tunnels module using the syntax in the following sections.

#### CREATE/MODIFY

```
create map [name]
modify map [name]
```

```

options:
  app-service [[string] | none]
  defaults-from [ [name] | none]
  description [string]
  ip6-prefix [ipv6 address/prefix length]
  ip4-prefix [ipv4 address/prefix length]
  ea-bits-length [integer]
  port-offset [integer]

edit map [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list map
list map [ [ [name] | [glob] | [regex] ] ... ]
show running-config map
show running-config map [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

DELETE
delete map [ all | [name] ]

DESCRIPTION
  You can use the map component to create a MAP profile that you
  associate with a tunnel using the tunnel component. For more
  information about creating a tunnel see net tunnel.

EXAMPLES
  create map my_map

  Creates a MAP profile called my_map.

  list map all-properties

  Displays all the properties of all the MAP profiles.

OPTIONS
  app-service
  Specifies the name of the application service to which the object
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the object. Only the application
  service can modify or delete the object.

  defaults-from
  Specifies the existing profile from which the system imports
  settings for the new profile. The default value is map.

  description
  User defined description.

  glob
  Displays the items that match the glob expression. See help glob
  for a description of glob expression syntax.

  name
  Specifies a unique name for the component. This option is required
  for the commands create and modify.

  partition
  Displays the administrative partition within which this component
  resides.

  regex
  Displays the items that match the regular expression. The regular
  expression must be preceded by an at sign (@[regular expression])
  to indicate that the identifier is a regular expression. See help
  regex for a description of regular expression syntax.

  ip6-prefix
  Specifies the IPv6 Prefix using CIDR notation, such as 2014::/48.
  The default prefix length is 48.

  ip4-prefix
  Specifies the IPv4 Prefix using CIDR notation, such as
  192.0.0.0/8. The default prefix length is 8.

  ea-bits-length
  Specifies the length in bits of the EA (Embedded Address) of the
  MAP domain. The default is 32 (IPv4 prefix 24 bits + PSID 8 bits).

  port-offset
  Specifies the port offset bits length of the MAP domain. The
  default is 6.

SEE ALSO
  create, delete, edit, glob, list, modify, net tunnels tunnel, regex,
  show, tmsh

COPYRIGHT

## net tunnels ppp

### NAME

ppp - Configures a PPP profile.

### MODULE

net tunnels

### SYNTAX

Configure the ppp component within the net tunnels module using the syntax in the following sections.

#### CREATE/MODIFY

```
create ppp [name]
```

```
modify ppp [name]
```

#### options:

```
app-service [[string] | none]
```

```
defaults-from [ [name] | none]
```

```
description [string]
```

```
lcp-echo-failure [integer]
```

```
lcp-echo-interval [integer]
```

```
vj [disabled | enabled]
```

```
edit ppp [ [ [name] | [glob] | [regex] ] ... ]
```

#### options:

```
all-properties
```

```
non-default-properties
```

#### DISPLAY

```
list ppp
```

```
list ppp [ [ [name] | [glob] | [regex] ] ... ]
```

```
show running-config ppp
```

```
show running-config ppp [ [ [name] | [glob] | [regex] ] ... ]
```

#### options:

```
all-properties
```

```
app-service
```

```
non-default-properties
```

```
one-line
```

```
partition
```

#### DELETE

```
delete ppp [ all | [name] ]
```

### DESCRIPTION

You can use the ppp component to create a ppp profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

### EXAMPLES

```
create ppp my_ppp
```

Creates a PPP profile called my\_ppp.

```
list ppp all-properties
```

Displays all the properties of all the PPP profiles.

### OPTIONS

#### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

#### defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is ppp.

#### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### lcp-echo-failure

Specifies the number of consecutive PPP LCP echo messages that must go unanswered for the server to drop PPP connection. For example, if the server sends number of consecutive PPP LCP Echo Request messages that go unanswered (by Echo Reply), it will close the PPP connection. The default value is 4.

#### lcp-echo-interval

Specifies the interval, in seconds, between the PPP LCP Echo Request messages that the server sends to the peer (client). The default value is 30.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition  
Displays the administrative partition within which this component resides.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

vj Specifies whether the system uses Van Jacobson Header Compression (also known as VJ compression, or just Header Compression), which is an option in most versions of PPP. VJ is a data compression protocol described in RFC 1144, specifically designed by Van Jacobson to improve TCP/IP performance over slow serial links. The default value is disabled.

## net tunnels tunnel

NAME  
tunnel - Configures a tunnel.

MODULE  
net tunnels

SYNTAX  
Configure the tunnel component within the net tunnels module using the syntax in the following sections.

CREATE/MODIFY

```
create tunnel [name]
modify tunnel [name]
options:
  app-service [[string] | none]
  auto-lasthop [default | enabled | disabled ]
  description [string]
  local-address [ip address]
  secondary-address [ip address]
  mode [bidirectional | inbound | outbound]
  mtu [integer]
  use-pmtu [enabled | disabled ]
  profile [name]
  remote-address [ip address]
  traffic-group [[traffic group] | none]
  tos [integer]
  transparent [enabled | disabled ]
  idle-timeout [integer]
  key [integer]
```

```
edit tunnel [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list tunnel
list tunnel [ [ [name] | [glob] | [regex] ] ... ]
show running-config tunnel
show running-config tunnel [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition
```

DELETE

```
delete tunnel [ all | [name] ]
```

DESCRIPTION

You can use the tunnel component to configure a tunnel.

EXAMPLES

```
create tunnel my_tunnel local-address 10.10.10.1 remote-address
11.11.11.1 profile gre
```

Creates a tunnel named `my_tunnel` between the local IP address 10.10.10.1 and the remote IP address 11.11.11.1.

`list tunnel all-properties`

Displays all of the properties of all of the tunnels.

#### OPTIONS

`app-service`

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

`auto-lasthop`

When enabled, specifies that the system returns packets to the MAC address from which they were sent. The default setting is `default`, which specifies that the system uses the default route to send back the request.

`description`

User defined description.

`glob` Displays the items that match the glob expression. See `help glob` for a description of glob expression syntax.

`if-index`

Displays the index assigned to this tunnel. It is a unique identifier assigned for all objects displayed in the SNMP IF-MIB.

`local-address`

Specifies a local IP address. This option is required.

`secondary-address`

Specifies a secondary non-floating IP address when the local-address is set to a floating address. Currently this setting is supported by NVGRE tunnels only.

`mode` Specifies how the tunnel carries traffic. The default value is `bidirectional`.

`mtu` Specifies the maximum transmission unit (MTU) of the tunnel. The default value is 0. When the MTU is set to the default value (of 0), the MTU of the tunnel is computed by the system and is set to the MTU size of the underlying interface minus the encapsulation overhead introduced by the tunneling protocol. The valid range is 0 - 65535.

`use-pmtu`

Enables or disables the tunnel to use the PMTU (Path MTU) information provided by ICMP NeedFrag error messages. If enabled and the tunnel MTU is set to 0, the tunnel will use the PMTU information. If enabled and the tunnel MTU is fixed to a non-zero value, the tunnel will use the minimum of PMTU and MTU. If disabled, the tunnel will use fixed MTU, or calculate its MTU using tunnel encapsulation configurations.

`name` Specifies a unique name for the component. This option is required for the commands `create`, and `modify`.

`partition`

Displays the administrative partition within which the component resides.

`profile`

Specifies the profile that you want to associate with the tunnel. This option is required for the `create` command.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

`remote-address`

Specifies a remote IP address. This value is required for the commands `create` and `modify`.

`traffic-group`

Specifies a traffic-group for use with the tunnel. Traffic group determines the ConfigSync behavior of the tunnel object.

`tos` Specifies a value for insertion into the Type of Service (ToS) octet within the IP header of the encapsulating header of transmitted packets. The default value is `preserve`. The possible values are 0 (zero) - 255.

`transparent`

Enables or disables the tunnel to be transparent. If enabled, the user can inspect and/or manipulate the encapsulated traffic flowing through the BIG-IP. A transparent tunnel terminates a tunnel while presenting the illusion that the tunnel transits the device unperturbed i.e. the BIG-IP appears like an intermediate router that simply routes IP traffic through the device. The default value is disabled.

`idle-timeout`

Specifies an idle timeout for wildcard tunnels in seconds. This setting specifies the number of seconds that a wildcard tunnel connection is idle before the connection is eligible for deletion. The default value is 300 seconds.

`key` The key field may represent different values depending on the type

of the tunnel. For VXLAN it represents the Virtual Network Identifier (VNI). The default value is 0.

## net tunnels v6rd

#### NAME

v6rd - Configures a 6RD profile.

#### MODULE

net tunnels

#### SYNTAX

Configure the v6rd component within the net tunnels module using the syntax in the following sections.

##### CREATE/MODIFY

```
create v6rd [name]
modify v6rd [name]
```

##### options:

```
app-service [[string] | none]
defaults-from [ [name] | none]
description [string]
v6rdprefix [IPv6 address]
v6rdprefixlen [integer]
ipv4prefix [IPv4 address]
ipv4prefixlen [integer]
```

```
edit v6rd [ [ [name] | [glob] | [regex] ] ... ]
```

##### options:

```
all-properties
non-default-properties
```

##### DISPLAY

```
list v6rd
list v6rd [ [ [name] | [glob] | [regex] ] ... ]
show running-config v6rd
show running-config v6rd [ [ [name] | [glob] | [regex] ] ... ]
```

##### options:

```
all-properties
app-service
non-default-properties
one-line
partition
```

##### DELETE

```
delete v6rd [ all | [name] ]
```

#### DESCRIPTION

You can use the v6rd component to create a v6rd profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

#### EXAMPLES

```
create v6rd my_v6rd
```

Creates a 6RD profile called my\_v6rd.

```
list v6rd all-properties
```

Displays all the properties of all the 6RD profiles.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is v6rd.

##### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition Displays the administrative partition within which this component resides.

regex Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

v6rdprefix Specifies the IPv6 prefix for 6rd domain.

v6rdprefixlen Specifies the IPv6 prefix length of the 6rd domain. The default is 56.

ipv4prefix As an extension not mentioned in the RFC5969, it specifies the IPv4 prefix for the Customer-Edge (CE) devices of a 6RD domain at a Border-Relay (BR) in case that the subnet prefixes used by the 6RD devices do not share the same IPv4 prefix. If they do, there is no need to configure this parameter. The default value is 0.0.0.0.

ipv4prefixlen Also noted as IPv4MaskLen in RFC5969, it specifies the number of identical high-order bits shared by all CE and BR IPv4 addresses in a given 6RD domain. The valid range is from zero to 32. It is a required value for create. It defaults to zero, i.e. the full ipv4 address must be encapsulated.

## net tunnels vxlan

NAME vxlan - Configures a VXLAN profile.

MODULE net tunnels

SYNTAX Configure the vxlan component within the net tunnels module using the syntax in the following sections.

```
CREATE/MODIFY
create vxlan [name]
modify vxlan [name]
options:
  app-service [[string] | none]
  defaults-from [ [name] | none]
  description [string]
  port [integer]
  flooding-type [none | multicast | multipoint | replicator]
  encapsulation-type [vxlan | vxlan-gpe]
```

```
edit vxlan [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list vxlan
list vxlan [ [ [name] | [glob] | [regex] ] ... ]
show running-config vxlan
show running-config vxlan [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
```

non-default-properties  
one-line  
partition

DELETE  
delete vxlan [ all | [name] ]

#### DESCRIPTION

You can use the vxlan component to create a vxlan profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

#### EXAMPLES

```
create vxlan my_vxlan
```

Creates a VXLAN profile called my\_vxlan.

```
list vxlan all-properties
```

Displays all the properties of all the VXLAN profiles.

#### OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

defaults-from

Specifies the existing profile from which the system imports settings for the new profile. The default value is vxlan.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

partition

Displays the administrative partition within which this component resides.

port Specifies the local port for receiving VXLAN packets. The default is 4789.

flooding-type

Specifies the flooding type to use to transmit multicast, broadcast and unknown destination frames. The default is multicast.

encapsulation-type

Specifies whether the VXLAN header is formatted according to RFC 7348 (vxlan) or with the Generic Protocol Extension (vxlan-gpe). The default is vxlan.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### SEE ALSO

## net tunnels wccp

#### NAME

wccp - Configures a Web-cache coordination protocol (WCCP) GRE profile.

#### MODULE

net tunnels

#### SYNTAX

Configure the wccp component within the net tunnels module using the

syntax in the following sections.

```
CREATE/MODIFY
create wccp [name]
modify wccp [name]
options:
  app-service [[string] | none]
  defaults-from [name]
  description [string]
  rx-csum [disabled | enabled]
  tx-csum [disabled | enabled]
  wccp-version [1 | 2]

edit wccp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list wccp
list wccp [ [name] | [glob] | [regex] ] ... ]
show running-config wccp
show running-config wccp [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

DELETE
delete wccp [ all | [name] ]
```

#### DESCRIPTION

You can use the wccp component to create a WCCP GRE profile that you associate with a tunnel using the tunnel component. For more information about creating a tunnel see net tunnel.

#### EXAMPLES

```
create wccp my_wccp_gre

Creates a WCCP GRE profile called my_wccp_gre.

list wccp all-properties

Displays all of the properties of all of the WCCP GRE profiles.
```

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**defaults-from**  
Specifies the existing profile from which the system imports settings for the new profile. The default value is wccpGRE.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create and modify.

**partition**  
Displays the administrative partition within which the component resides.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**rx-csum**  
Specifies whether the system verifies the checksum on received packets. The default value is disabled.

**tx-csum**  
Specifies whether the system includes a checksum on transmitted packets. The default value is disabled.

**wccp-version**  
Specifies the version of WCCP that the system uses. The default value is 2.

#### SEE ALSO

## net vlan-group

**NAME**  
vlan-group - Configures a VLAN group.

**MODULE**  
net

**SYNTAX**  
Modify the vlan-group component within the net module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create vlan-group [name]  
modify vlan-group [name]  
options:  
app-service [[string] | none]  
auto-lasthop [default | enabled | disabled ]  
bridge-in-standby [disabled | enabled]  
bridge-multicast [disabled | enabled]  
bridge-traffic [disabled | enabled]  
description [string]  
members  
[add | delete | replace-all-with] ] {  
[vlan name] ...  
}  
members [default | none]  
migration-keepalive [disabled | enabled]  
mode [opaque | translucent | transparent]  
proxy-excludes  
[add | delete | replace-all-with] ] {  
[ip address] ...  
}  
proxy-excludes [default | none]

edit vlan-group [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

```

DISPLAY
list vlan-group
list vlan-group [ [ name ] | [ glob ] | [ regex ] ] ... ]
show running-config vlan-group
show running-config vlan-group
  [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
  all-properties
  non-default-properties
  one-line

show vlan-group
show vlan-group [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
  all-properties
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt

```

```

DELETE
delete vlan-group [name]

```

#### DESCRIPTION

The vlan-group component defines a VLAN group, which is a grouping of two or more VLANs belonging to the same IP network for the purpose of allowing Layer 2 packet forwarding between those VLANs.

The VLANs between which the packets are to be passed must be on the same IP network, and they must be grouped using the vlan-group component. For example: modify vlan-group network11 members add { internal external }.

#### EXAMPLES

```
create vlan-group my_vlan-group members add { vlan1 vlan2 }
```

Creates a VLAN group named my\_vlan-group that consists of VLANs named vlan1 and vlan2.

```
modify vlan-group proxy-excludes add { 10.10.10.1 }
```

Sets the global VLAN group proxy exclusion list.

```
delete vlan-group my_vlan-group
```

Deletes the VLAN group named my\_vlan-group.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### bridge-traffic

When enabled, specifies that the VLAN group forwards all frames, including non-IP traffic. The default value is disabled.

##### bridge-in-standby

When enabled, specifies that the VLAN group forwards packets, even when the system is the standby unit in a redundant system. This option is designed for deployments in which the VLAN group exists on only one of the units. If that does not match your configuration, using this option may cause adverse effects. The default value is disabled.

##### bridge-multicast

When enabled, allows bridging of non-Internet Protocol (IP) Address Resolution Protocol (ARP) multicast frames across a VLAN group. An example of when you might want to use this option is when you are implementing the Spanning Tree Protocol (STP).

##### description

User-defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### if-index

Displays the index assigned to this VLAN group. It is a unique identifier assigned for all objects displayed in the SNMP IF-MIB.

##### members

The names of the VLANs that you want to add to or delete from the VLAN group.

##### migration-keepalive

Specifies whether the system will send keepalive frames (TCP keepalives and empty UDP packets depending on the connection type) when a node is moved from one VLAN group member to another VLAN group member for all existing connections that the system has to that node.

mode Specifies the level of exposure of remote MAC addresses within VLAN groups. The default value is translucent.

The options are:

##### opaque

Use this option when you have a Cisco router in the network sending CDP packets to the system. Because opaque VLAN groups require a source and destination MAC address, and CDP packets do not contain a source and destination MAC address, the CDP packets are not forwarded through the VLAN group. This mode changes the MAC address to the MAC address assigned to the

VLAN group, a proxy ARP with Layer 3 forwarding.

**translucent**  
Uses the real MAC address of the requested host with the locally unique bit toggled. Specifies that the system uses Layer 2 forwarding with locally-unique bit, toggled in ARP response across VLANs.

**transparent**  
Leaves the MAC address unchanged by the traffic management system. Specifies that the system uses Layer 2 forwarding with the original MAC address of the remote system preserved across VLANs.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**proxy-excludes**  
Specifies the IP addresses that you want to include in the proxy ARP exclusion list. If you use VLAN groups, you must configure a proxy ARP forwarding exclusion list. F5 Networks recommends that you configure this feature if you use VLAN groups with a redundant system. The reason is that both units need to communicate directly with their gateways and the back-end nodes. Creating a proxy ARP exclusion list prevents traffic from being proxied through the active unit due to proxy ARP. This traffic needs to be sent directly to the destination, not proxied.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

  field-fmt

```

```

DELETE
delete vlan [name]

```

#### DESCRIPTION

VLANS are part of the configuration of the BIG-IP(r) network components. VLANS can be based on either ports or tags. When creating a VLAN, a tag value for the VLAN is automatically chosen unless you specify a tag value on the command line.

VLANS can have both tagged and untagged interfaces. You can add an interface to multiple VLANS as a tagged interface. You can add an interface to a single VLAN as an untagged interface. The tagged traffic can be single tagged and double tagged.

Note: To reset the statistics that display when you use the command sequence show vlan, you must reset the statistics for the trunks and interfaces associated with the VLAN.

#### EXAMPLES

```
create vlan my_vlan interfaces add { 1.2 1.3 1.4 }
```

Create the VLAN my\_vlan that includes the interfaces 1.2, 1.3, and 1.4.

```
delete vlan my_vlan
```

Delete the VLAN named my\_vlan.

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**description**  
User-defined description.

**failsafe**  
Enables a fail-safe mechanism that causes the active cluster to fail over to a redundant cluster when loss of traffic is detected on a VLAN, and traffic is not restored during the failover timeout period for that VLAN. The default value is disabled.

When you set the VLAN failsafe option to enabled, the default failsafe-action value is restart-all. Therefore, when the fail-safe mechanism is triggered, all the daemons are restarted and the unit fails over.

**failsafe-action**  
Specifies the action for the system to take when the fail-safe mechanism is triggered. The default value is failover-restart-tm.

**failsafe-timeout**  
Specifies the number of seconds that an active unit can run without detecting network traffic on this VLAN before it starts a failover. The default value is 90 seconds.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**if-index**  
Displays the index assigned to this VLAN. It is a unique identifier assigned for all objects displayed in the SNMP IF-MIB.

**interfaces**  
Specifies a list of tagged or untagged interfaces and trunks that you want to configure for the VLAN. Use tagged interfaces or trunks when you want to assign a single interface or trunk to multiple VLANS.

A tagged interface is one that you assign to a VLAN in a way that causes the system to add a VLAN tag into the header of any frame passing through that interface or trunk.

A trunk is a combination of two or more interfaces and cables configured as one link.

#### tag-mode

Specifies the tag mode of the interface or trunk associated with. The default value is none.

The available values are:

#### customer

Specifies tag-mode setting for vlan members that are facing customer network and carry single tagged traffic.

#### service

Specifies tag-mode setting for vlan members that are facing the service provider networks and carry single tagged traffic.

#### double

Specifies tag-mode setting for vlan members that are facing the service provider networks and carry double tagged traffic.

none Specifies no tag-mode setting.

#### learning

Specifies whether switch ports placed in the VLAN are configured for switch learning, forwarding only, or dropped. The default value is enable-forward.

mtu Sets a specific maximum transition unit (MTU) for the VLAN. The default value is 1500. This value does not include the layer2 header.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### sflow

Specifies sFlow settings for the VLAN:

#### poll-interval

Specifies the maximum interval in seconds between two pollings. The default value is 0. To enable this setting, you must also set the poll-interval-global setting to no.

#### poll-interval-global

Specifies whether the global VLAN poll-interval setting, which is available under sys sflow global-settings module, overrides the object-level poll-interval setting. The default value is yes.

The available values are:

no Specifies to use the object-level poll-interval setting.

yes Specifies to use the global VLAN poll-interval setting.

#### sampling-rate

Specifies the ratio of packets observed to the samples generated. For example, a sampling rate of 2000 specifies that 1 sample will be randomly generated for every 2000 packets observed. The default value is 0. To enable this setting, you must also set the sampling-rate-global setting to no.

#### sampling-rate-global

Specifies whether the global VLAN sampling-rate setting, which is available under sys sflow global-settings module, overrides the object-level sampling-rate setting. The default value is yes.

The available values are:

no Specifies to use the object-level sampling-rate setting.

yes Specifies to use the global VLAN sampling-rate setting.

#### source-checking

Specifies that only connections that have a return route in the routing table are accepted. The default value is disabled.

tag Specifies a number that the system adds into the header of any frame passing through the VLAN. The value can be 1 through 4094. The default is to not use this option, and the system assigns a tag number.

#### customer-tag

Specifies a number that the system adds into the header of any double tagged frame passing through the VLAN. The value can be any of the following: 1 through 4094, or none. The

default is none.

#### cmp-hash

Specifies how the traffic on the VLAN will be disaggregated. The traffic disaggregation on the VLAN can be based on source ip, dest ip, or L4 ports. The default cmp hash uses L4 ports.

#### dag-tunnel

Specifies whether the ip tunnel traffic on the VLAN should be disaggregated based on the inner ip header or outer ip header. The default value is outer.

#### dag-round-robin

Specifies whether intended stateless traffic on the VLAN should be disaggregated in a round-robin order instead of using static hash. The stateless traffic include nonIP L2 traffic and user-specified UDP protocols. The sys db variable dag.roundrobin.redag allows HSBs to round robin stateless traffic to remote HSBs/blades.

#### hardware-syncookie

Enables hardware syncookie mode on a VLAN. When enabled, the hardware per-VLAN SYN cookie protection will be triggered when the certain traffic threshold is reached on supported platforms. The default value is disabled.

#### syncache-threshold

Specifies the number of outstanding SYN packets on the VLAN that will trigger the hardware per-VLAN SYN cookie protection. The default value is set to 6000 packets.

#### syn-flood-rate-limit

Specifies the max number of SYN flood packets per second received on the VLAN before the hardware per-VLAN SYN cookie protection is triggered. The default value is set at 1000 packets per second.

  non-default-properties
  one-line

DELETE
delete wccp [name]

DESCRIPTION
You can use the wccp component to create and modify WCCPv2 service
groups. WCCPv2 is a content-routing protocol developed by Cisco
Systems, Inc., which provides a mechanism to redirect traffic flows in
real time. A WCCP service in this context is a set of redirection
criteria and processing instructions that the BIG-IP(r) system applies
to any traffic that a router in the service group redirects to the BIG-
IP system.

EXAMPLES
list wccp service-wccp all-properties

Displays the services and their attributes in the service group
named service-wccp.

modify server-wccp cache-timeout 40

Changes the cache-timeout setting to 40 for the service group
named server-wccp.

modify server-wccp services modify { 77 {weight 60} }

Changes the weight setting to 60 for the service identified as 77
in the service group named server-wccp.

OPTIONS
app-service
Specifies the name of the application service to which the object
belongs. The default value is none. Note: If the strict-updates
option is enabled on the application service that owns the object,
you cannot modify or delete the object. Only the application
service can modify or delete the object.

cache-timeout
Specifies the frequency of control messages between the system and
the router. The range is from 1 to 60 seconds. The default value
is 10.

description
User-defined description.

glob Displays the items that match the glob expression. See help glob
for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required
for the commands create, delete, and modify.

regex
Displays the items that match the regular expression. The regular
expression must be preceded by an at sign (@[regular expression])
to indicate that the identifier is a regular expression. See help
regex for a description of regular expression syntax.

services
Specifies the service group identifier, a number between 51 and
255 that matches a service ID configured on the router.

Adds, deletes, or replaces a set of services. You can configure
the following options for a service:

app-service
Specifies the name of the application service to which the
service belongs. The default value is none. Note: If the
strict-updates option is enabled on the application service
that owns the object, you cannot modify or delete the
service. Only the application service can modify or delete
the service.

hash-fields
Specifies to the router which traffic attributes to use to
determine which BIG-IP system it should forward traffic to
for load balancing: destination IP address (dest-ip),
destination port (dest-port), source IP address (src-ip),
and/or source port (src-port).

object identifier
Specifies the service group identifier, a number between 51
and 255 that matches a service ID configured on the router.

password
Specifies the password for MD5 authentication or none.

```

**port-type**  
Specifies whether the WCCP interception of traffic is based on the destination port (dest) or source port (source), or is not specified (none). The default value is none.

**ports**  
Specifies one or more ports (up to 8) on which traffic is redirected.

**priority**  
Specifies the precedence of the service group relative to the other service groups. The range is from 1 to 255. The default value is 100.

**protocol**  
Specifies the protocol of the traffic to be redirected: TCP (tcp) or UDP (udp). The default value is tcp.

**redirection**  
Specifies the method the router uses to redirect traffic: GRE gre or L2 l2. The default value is gre.

**return**  
Specifies the method used to return passthrough traffic to the router: GRE (gre) or L2 (l2). The default value is gre.

**routers**  
Specifies the IP addresses of the WCCP-enabled routers that redirect traffic.

**traffic-assign**  
Specifies whether load balancing is achieved by a hash algorithm or a mask. If you specify hash, specify one or more attributes using the option hash-fields.

**tunnel-local-address**  
Specifies an IP address on the BIG-IP system to which the WCCP-enabled routers should redirect traffic. Specify a self IP address of an external VLAN on the BIG-IP system.

**tunnel-remote-addresses**  
Specifies the Router Identifier IP address of the router that redirects traffic.

**weight**  
Specifies the relative importance of this traffic in a load-balancing environment. The range is from 1 to 100. The default value is 50.

## pem

### pem forwarding-endpoint

**NAME**  
forwarding-endpoint - Configures forwarding endpoints for the Policy Enforcement Manager (PEM).

**MODULE**  
pem

**SYNTAX**  
Modify the forwarding-endpoint component within the pem module using the syntax shown in the following sections.

```
CREATE/MODIFY
create forwarding-endpoint [name]
modify forwarding-endpoint [name]
options:
  app-service [[string] | none]
  description [[string] | none]
  persistence {
    options:
  type [destination-ip | disabled | hash | source-ip]
  fallback [destination-ip | disabled | source-ip]
  hash-settings {
```

```

options:
  algorithm [carp ]
  length [integer]
  offset [integer]
  source [tcl-snippet | uri]
  tcl-value [string]
}
}
pool [name]
snat-pool [name]
source-port [change | preserve | preserve-strict]
translate-address [disabled | enabled]
translate-service [disabled | enabled]

edit forwarding-endpoint [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list forwarding-endpoint
list forwarding-endpoint [ [ [name] | [glob] | [regex] ] ... ]
show running-config forwarding-endpoint
show running-config forwarding-endpoint [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete forwarding-endpoint [name]

```

Note: All references to the forwarding-endpoint must be removed before it can be deleted.

#### DESCRIPTION

forwarding-endpoint is used to specify PEM policy forwarding action(s).

Note: A valid LTM pool with at least one member must be pre-configured before creating a forwarding-endpoint. Please refer to ltm pool for more info about configuring LTM pools.

#### EXAMPLES

```

create forwarding-endpoint my_endpoint { pool my_pool snatpool
my_snatpool source-port preserved translate-address enabled translate-
service enabled }

```

Creates a Policy Enforcement Manager forwarding endpoint named my\_endpoint.

```

delete forwarding-endpoint my_endpoint

```

Deletes the forwarding-endpoint named my\_endpoint.

```

list forwarding-endpoint my_endpoint

```

Displays the properties of the forwarding-endpoint named my\_endpoint.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, user cannot modify or delete the object. Only the application service can modify or delete the object.

##### description

Specifies a user-defined description.

##### persistence

Allows to set a specific persistence method for the pool member selection.

##### fallback

Specifies the fallback persistence method so that it applies when default persistence fail.

The options are:

##### destination-ip

Map the destination ip address to a specific pool member so that subsequent traffic sent to this address is directed to the same pool member.

##### source-ip

Map the source ip address to a specific pool member so that subsequent traffic from this address is directed to the same pool member.

##### disabled

Specifies that this feature is disabled.

##### hash-settings

Specifies the settings for the hash persistence method.

##### algorithm

Specifies the algorithm to calculate the hash value. Currently only the carp algorithm is available.

##### length

Specifies the length of the source string used to calculate hash value. Default value of length is 1024.

**offset**  
Specifies the offset in bytes from start of the source string to calculate the hash value. Default value of offset is 0.

**source**  
Specifies the source for the string value which is used to calculate hash value.

**tcl-value**  
Specifies the tcl script snippet so that when this script is executed its result used to calculate the hash value.

**type** Specifies the persistence method.

The options are:

**destination-ip**  
Map the destination ip address to a specific pool member so that subsequent traffic sent to this address is directed to the same pool member.

**hash** Map the hash value to a specific pool member so that subsequent traffic with the same hash value is directed to the same pool member.

**source-ip**  
Map the source ip address to a specific pool member so that subsequent traffic from this address is directed to the same pool member.

**disabled**  
Specifies that this feature is disabled.

**pool** Specifies the name of an LTM pool where the traffic is going to be directed to. Is used in the PEM policy rule forwarding actions. Note that the pool must be pre-configured before it can be referenced by a forwarding action.

**snat-pool**  
Specifies the name of an existing LTM SNAT pool (snatpool) that is used to translate the client IP address to one of the configured IP addresses in that SNAT pool. The Self-IP addresses of the BIG-IP system must not be included in the SNAT pool. The default value is none.

**source-port**  
Specifies whether the system preserves the source port of the connection. The default value is preserve.

The options are:

**change**  
Specifies that the system changes the source port. This setting is useful for obfuscating internal network address.

**preserve**  
Specifies that the system preserves the value configured for the source port, unless the source port from a particular snat is already in use, in which case the system uses a different port.

**preserve-strict**  
Specifies that the system preserves the value configured for the source port. If the port is in use, the system does not process the connection. F5 Networks recommends restricting the use of this setting to cases that meet at least one of the following conditions:

The port is configured for UDP traffic.

The system is configured for nPath routing or is running in transparent mode (that is, there is no translation of any other Layer 3 or Layer 4 field).

There is a one-to-one relationship between virtual IP addresses and node addresses, or clustered multiprocessing (CMP) is disabled.

**translate-address**  
Specifies, when enabled, that the system translates the original destination address of the virtual server. When disabled, specifies that the system uses the address without translation. The default value is disabled.

**translate-service**  
Note that translate-service is really translate-port. It specifies, when enabled, that the system translates the original destination port. When disabled, it specifies that the system uses the original destination port without translation. The default value is disabled.

## **pem global-settings analytics**

**NAME**  
Analytics - Configures the global settings that pertain to Analytics reporting for Policy Enforcement Manager (PEM).

**MODULE**  
pem global-settings

**SYNTAX**  
Modify the analytics component within the pem global-settings module using the syntax shown in the following sections.

**MODIFY**  
modify analytics {  
 options:  
 mode [disabled | enabled]  
 subscriber-aware [disabled | enabled]  
 logging {  
 hsl {  
 endpoint-id [log-publisher]  
 }  
 }  
}

edit analytics [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
 all-properties  
 non-default-properties

**DISPLAY**  
list analytics  
list analytics [ [ [name] | [glob] | [regex] ] ... ]  
show running-config analytics  
show running-config analytics [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
 all-properties  
 non-default-properties  
 one-line  
 partition

**DESCRIPTION**  
You can use the analytics component to configure global settings for analytics reporting.

**EXAMPLES**  
modify analytics mode disabled subscriber-aware disabled logging hsl endpoint-id hsl\_endpoint  
  
Enables the analytics reporting for PEM and configures logging endpoint as hsl\_endpoint.  
  
list analytics  
  
Displays the configuration for analytics settings.

**OPTIONS**  
mode Specifies the mode for analytics reporting. It can take enable or disable as value.  
  
subscriber-aware Specifies the subscriber awareness for analytics reporting. It can take enable or disable as value.  
  
logging You can configure the following option for logging.  
  
hsl You can configure the following options for hsl endpoint.  
  
endpoint-id Specifies the endpoint name.

**SEE ALSO**

## **pem global-settings insert-content**

**NAME**  
insert-content - Configures the global settings that pertain to insert content for Policy Enforcement Manager (PEM).

**MODULE**  
pem global-settings

**SYNTAX**  
Modify the insert-content component within the pem global-settings module using the syntax shown in the following sections.

**MODIFY**  
modify insert-content {  
  options:  
    max-duration [value]  
}

edit insert-content [ [ [name] | [glob] | [regex] ] ... ]  
  options:  
    all-properties  
    non-default-properties

**DISPLAY**  
list insert-content  
list insert-content [ [ [name] | [glob] | [regex] ] ... ]  
show running-config insert-content  
show running-config insert-content [ [ [name] | [glob] | [regex] ] ... ]  
  options:  
    all-properties  
    non-default-properties  
    one-line  
    partition

**DESCRIPTION**  
You can use the insert-content component to configure global settings for content insert functionality.

**EXAMPLES**  
modify insert-content max-duration 3600  
  
Modifies the content insertion max duration when action is throttled to apply once.  
  
list insert-content  
  
Displays the configuration for insert-content settings.

**OPTIONS**  
mode Specifies the max duration for applying insert content action when frequency Once is used.

**SEE ALSO**  
create, delete, edit, glob, list, modify, pem listener, pem policy, pem profile diameter-endpoint, pem profile spm, pem reporting format-script, pem service-chain-endpoint, pem subscriber, pem subscribers, regex, show, tms

## **pem global-settings quota-mgmt**

**NAME**

quota-mgmt - Configures the global settings that pertain to quota management over Gy for Policy Enforcement Manager (PEM).

#### MODULE

pem global-settings

#### SYNTAX

Modify the quota-mgmt component within the pem global-settings module using the syntax shown in the following sections.

##### MODIFY

modify quota-mgmt

##### options:

default-rating-group [rating-group-name]  
service-context-id [string]

edit quota-mgmt [ [name] | [glob] | [regex] ] ... ]

##### options:

all-properties  
non-default-properties

##### DISPLAY

list quota-mgmt

list quota-mgmt [ [name] | [glob] | [regex] ] ... ]

show running-config quota-mgmt

show running-config quota-mgmt [ [name] | [glob] | [regex] ] ... ]

##### options:

all-properties  
non-default-properties  
one-line  
partition

#### DESCRIPTION

You can use the quota-mgmt component to configure global settings for quota management over Gy.

#### EXAMPLES

```
modify quota-mgmt default-rating-group rg_grp_1 service-context-id
32251@3gpp.org
```

Configures rg\_grp\_1 as default rating group and service-context-id as 32251@3gpp.org. rg\_grp\_1 should be defined before.

```
list quota-mgmt
```

Displays the configuration for quota-mgmt.

#### OPTIONS

default-rating-group

Specifies the default rating group for quota management over Gy.

service-context-id

Specifies the service-context-id to be used for CCR message over Gy.

#### SEE ALSO

create, delete, edit, glob, list, modify, pem quota-mgmt rating-group, pem listener, pem policy, pem profile diameter-endpoint, pem profile spm, pem reporting format-script, pem service-chain-endpoint, pem subscriber, pem subscribers, regex, show, tmsh

## pem global-settings session-mgmt-attributes

#### NAME

session-mgmt-attributes - Configures the global settings that pertain to session management attributes for Policy Enforcement Manager (PEM).

#### MODULE

pem global-settings

#### SYNTAX

Modify the session-mgmt-attributes component within the pem global-settings module using the syntax shown in the following sections.

##### MODIFY

modify session-mgmt-attributes

##### options:

clear-on-nas-reboot [enabled | disabled]  
flow-term-on-sess-delete [enabled | disabled]

```
edit session-mgmt-attributes
  options:
    clear-on-nas-reboot [enabled | disabled]
    flow-term-on-sess-delete [enabled | disabled]

DISPLAY
list session-mgmt-attributes
list session-mgmt-attributes [ name ]
show running-config session-mgmt-attributes
show running-config session-mgmt-attributes [ name ]
  options:
    clear-on-nas-reboot
    flow-term-on-sess-delete
```

#### DESCRIPTION

You can use the session-mgmt-attributes component to configure global settings for session management attributes.

#### EXAMPLES

```
modify session-mgmt-attributes clear-on-nas-reboot enabled
```

Enable clear-on-nas-reboot so that when accounting-on or accounting-off Radius message is received for a particular NAS address, which indicates NAS reboot, will trigger clearing all PEM sessions associated with the NAS address.

```
modify session-mgmt-attributes flow-term-on-sess-delete enabled
```

Enable flow-term-on-sess-delete so that flow will be terminated shortly after session is marked for deletion.

```
list session-mgmt-attributes
```

Displays the configuration for session-mgmt-attributes.

#### OPTIONS

```
clear-on-nas-reboot
```

Specifies clear on nas reboot config for session-mgmt-attributes. The default value is disabled.

```
flow-term-on-sess-delete
```

Specifies flow termination on session delete config for session-mgmt-attributes. The default value is disabled.

#### SEE ALSO

create, delete, edit, glob, list, modify, pem quota-mgmt, pem listener, pem policy, pem profile diameter-endpoint, pem profile spm, pem reporting format-script, pem service-chain-endpoint, pem subscriber, pem subscribers, regex, show, tmsh

## pem global-settings subscriber-activity-log

#### NAME

subscriber-activity-log - Configures the global settings that pertain to subscriber activity log messages for Policy Enforcement Manager (PEM).

#### MODULE

pem global-settings

#### SYNTAX

Modify the subscriber-activity-log component within the pem global-settings module using the syntax shown in the following sections.

#### MODIFY

```
modify subscriber-activity-log
```

#### options:

```
dynamic-subscriber-ids [add | delete | modify | replace-all-with] {
  [id_name ...]
}
dynamic-subscriber-ids [none]
publisher [name]
static-subscriber-ids [add | delete | replace-all-with] {
  [id_name ...]
}
static-subscriber-ids [default | none]
subscriber-ip-addresses [add | delete | modify | replace-all-with] {
  [ip address/prefixlen ...]
}
subscriber-ip-addresses [none]
```

```
edit subscriber-activity-log [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

reset-stats subscriber-activity-log

DISPLAY
list subscriber-activity-log
list subscriber-activity-log [ [ [name] | [glob] | [regex] ] ... ]
show running-config subscriber-activity-log
show running-config subscriber-activity-log [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

show subscriber-activity-log
  options:
    all-properties
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    default
    field-fmt
```

#### DESCRIPTION

You can use the subscriber-activity-log component to monitor behavior of the subscribers in the troubleshooting mode by sending activity log messages to one or more destinations. You can add static and dynamic subscribers by IDs, or by subscriber IP addresses. The activity log messages contain the internal information exposing the subscribers behavior.

#### EXAMPLES

```
modify subscriber-activity-log publisher publ dynamic-subscriber-ids
add { 4081112222 }

Adds dynamic subscriber 4081112222 to troubleshooting mode by sending
activity log messages to all destinations defined in publ.

list subscriber-activity-log

Displays the list of the subscribers in troubleshooting mode.

show subscriber-activity-log

Displays the logging statistics of the subscribers in troubleshooting
mode.

reset-stats subscriber-activity-log

Resets the logging statistics of the subscribers in troubleshooting
mode.
```

#### OPTIONS

**dynamic-subscriber-ids**  
Specifies a list of dynamic subscriber IDs to be in troubleshooting mode.

**publisher**  
Specifies the external logging publisher used to send activity log messages to one or more destinations.

**static-subscriber-ids**  
Specifies a list of static subscriber IDs to be in troubleshooting mode.

**subscriber-ip-addresses**  
Specifies a list of subscriber IP addresses to be in troubleshooting mode.

#### SEE ALSO

create, delete, edit, glob, list, modify, pem forwarding-endpoint, pem interception-endpoint, pem listener, pem policy, pem profile diameter-endpoint, pem profile spm, pem reporting format-script, pem service-chain-endpoint, pem subscriber, pem subscribers, regex, show, tmsh

BIG-IP pem0global-settings subscriber-activity-log(1)

**NAME** interception-endpoint - Configures interception endpoints for the Policy Enforcement Manager (PEM).

**MODULE** pem

**SYNTAX** Modify the interception-endpoint component within the pem module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create interception-endpoint [name]  
modify interception-endpoint [name]  
options:  
app-service [[string] | none]  
persistence [destination-ip | disabled | source-ip]  
pool [name]

edit interception-endpoint [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list interception-endpoint  
list interception-endpoint [ [ [name] | [glob] | [regex] ] ... ]  
show running-config interception-endpoint  
show running-config interception-endpoint [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition

**DELETE**  
delete interception-endpoint [name]

Note: You must remove all references to an interception-endpoint before you can delete the interception-endpoint.

**DESCRIPTION**  
You can use the interception-endpoint component to configure interception-endpoint definitions for the Policy Enforcement Manager. The interception-endpoint is used to clone all traffic. Note: Before you create a cloning-endpoint you have to create a valid pool. Please refer to ltm pool for more information about how to create a pool.

**EXAMPLES**  
create interception-endpoint my\_endpoint { pool pool1 }

Creates a Policy Enforcement Manager interception-endpoint named my\_endpoint.

delete interception-endpoint my\_endpoint

Deletes the interception-endpoint named my\_endpoint.

list interception-endpoint my\_endpoint

Displays the properties of the interception-endpoint named my\_endpoint.

**OPTIONS**

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**persistence**  
Specifies the persistence that is based on either the source or destination IP addresses only.

**pool** Specifies the pool. It is mandatory to specify a pool when creating any interception-endpoint. Before you create an interception-endpoint you have to create a valid pool.

**SEE ALSO**  
create, delete, edit, glob, list, modify, pem forwarding-endpoint, pem listener, pem policy, pem profile diameter-endpoint, pem profile spm, pem reporting format-script, pem service-chain-endpoint, pem subscriber, pem subscribers, regex, show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2013-03-21 pem interception-endpoint(1)

# pem irule

**NAME**  
irule - Configures an PEM iRule for traffic management system configuration.

**MODULE**  
pem

**SYNTAX**  
Configure the irule component within the pem module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create irule [name]  
edit irule [name]  
modify irule [ [name] | [glob] | [regex] ] ... ]

Note: When using tmsh, you can only create pem iRule using the editor, which starts when you use the create or edit commands. You cannot create an pem iRule directly on the command line. The vim editor applies the autoindent and smartindent options. You can toggle on/off paste mode using the F12 key.

Note: You can also edit user metadata associated with a pem iRule. See the example section for more information.

**DISPLAY**  
list irule  
list irule [ [name] | [glob] | [regex] ] ... ]  
show running-config irule  
show running-config irule [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

show irule  
show irule [ [name] | [glob] | [regex] ] ... ]  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
field-fmt

**DELETE**  
delete irule [name]

**DESCRIPTION**  
You can apply pem iRules as an action when the traffic matches the filter criteria defined in pem policy rule. The syntax that you use to write pem iRules is based on the Tools Command Language (Tcl) programming standard. Thus, you can use many of the standard Tcl commands, plus a robust set of extensions that the BIG-IP(r) policy enforcement management system provides to help you customize the actions you want to apply to the traffic.

You cannot edit the system iRules that come with the BIG-IP system. However, you can open a system iRule in the editor and use it as a template to create a new rule.

To create a new pem iRule using a system rule as a template:

1. Enter the command sequence edit irule [system rule name].  
tmsh opens the system rule in an editor.

2. Change the name of the rule in the editor.  
3. Edit the rule and exit the editor.

tmsh checks for syntax errors, and if there are none, it saves the new rule.

For more information about iRules(r), see <http://devcentral.f5.com/>.

## EXAMPLES

```
list irule
```

Displays all iRules.

```
delete irule my_irule
```

Deletes the pem iRule named my\_irule.

```
create irule my_irule {  
  priority 1  
  when PEM_POLICY {  
  }  
}
```

Creates a pem iRule named my\_irule with priority 1.

```
modify rule my_irule {  
  when RULE_INIT {}  
  metadata replace-all-with {  
  my_meta {  
    persist false  
    value "hello"  
  }  
  my_meta2 {  
    persist false  
    value "hello 2"  
  }  
}
```

Modifies an existing pem iRule named my\_irule by adding a new metadata and modifying an existing metadata.

The metadata attribute is the user defined key/value pair. Metadata has the following format:

```
metadata
  [add | delete | modify] {
  [metadata_name] {
    value [ "value content" ]
    persist [ true | false ]
  }
}

modify irule my_irule {
  when RULE_INIT {}
  metadata delete { my_meta }
}
```

Deletes a metadata from a pem iRule.

#### OPTIONS

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the create, delete, and modify commands.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**metadata**  
Specifies the user-defined key/value pair associated with the rule. See the example section for usage format.

## pem listener

#### NAME

listener - Configures listeners for the Policy Enforcement Manager (PEM).

#### MODULE

pem

#### SYNTAX

Modify the listener component within the pem module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create listener [name]
modify listener [name]
options:
  app-service [[string] | none]
  description [string]
  profile-spm [name]
  profile-subscriber-mgmt [name]
  virtual-servers [name] [add | delete | replace-all-with] {
    [virtual_server_name ... ]
  }
```

```
edit listener [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

##### DISPLAY

```
list listener
list listener [ [name] | [glob] | [regex] ] ... ]
show running-config listener
show running-config listener [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

one-line  
partition

DELETE  
delete listener [name]

Note: You must remove all references to a listener before you can delete the listener.

DESCRIPTION  
You can use the listener component to configure listener definitions for the Policy Enforcement Manager.

EXAMPLES  
create listener lis1 { profile-spm spm1 virtual-servers add {vs\_tcp vs\_udp} }  
  
Creates a Policy Enforcement Manager listener named lis1.  
  
delete listener lis1  
  
Deletes the listener named lis1.  
  
list listener lis1  
  
Displays the properties of the listener named lis1.

OPTIONS  
app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.  
  
description  
User defined description.  
  
profile-spm  
Specifies the spm profile name.  
  
profile-subscriber-mgmt  
Specifies the subscriber-mgmt profile name.  
  
virtual-servers  
Adds, deletes, or replaces a set of virtual servers, by specifying a virtual server name.

SEE ALSO  
create, delete, edit, glob, list, modify, pem forwarding-endpoint, pem interception-endpoint, pem policy, pem profile diameter-endpoint, pem profile spm, pem profile subscriber-mgmt, pem reporting format-script, pem service-chain-endpoint, pem subscriber, pem subscribers, regex, show, tmsh

## pem policy

NAME  
policy - Configures policies for the Policy Enforcement Manager (PEM).

MODULE  
pem

SYNTAX  
Modify the policy component within the pem module using the syntax shown in the following sections.

CREATE/MODIFY  
create policy [name]  
modify policy [name]  
options:  
description [string]  
status [enabled | disabled]  
transactional [enabled | disabled]  
rules [add | delete | modify | replace-all-with] {  
[rule\_name ... ] {  
options:  
app-service [[string] | none]  
classification-filters [add | delete | modify | replace-all-with] {  
[filter\_name ...] {

```

    options:
      app-service [[string] | none]
      application [application_name]
      category [category_name]
      operation [match | nomatch]
  }
}
dscp-marking-downlink [integer]
dscp-marking-uplink [integer]
dtos-tethering {
  options:
    dtos-detect [enabled | disabled]
    tethering-detect [enabled | disabled]
    report {
      dest {
        hsl {
          options:
            format-script [ [format_script_name] | none]
            publisher [ [publisher_name] | none ]
        }
      }
    }
}
}
ran-congestion {
  options:
    detect [enabled | disabled]
    lowerthreshold-bw [integer]
    report {
      dest {
        hsl {
          options:
            format-script [ [format_script_name] | none]
            publisher [ [publisher_name] | none ]
        }
      }
    }
}
}
flow-info-filters [add | delete | modify | replace-all-with] {
  [filter-name ...] {
    options:
      app-service [[string] | none]
      dscp-code [integer]

DELETE
delete policy [name]

```

Note: You must remove all references to a policy before you can delete the policy.

#### DESCRIPTION

You can use this policy component to configure the policy definitions on the Policy Enforcement Manager. A policy is a set of rules which are used to match traffic flow and apply actions. A rule has configuration

for filters and actions. All configured filters must match before the actions can be applied to the traffic flow. There are four filters: classification-filter, url-category-filter, flow-info-filter, and tcl-filter. Classification-filter allows for matching the traffic based on the flow L7 features, such as a specific application (for example, Google Mail) or application category (for example, Web). URL-category-filter allows for matching the type of URL, such as adult content. Flow-info-filter allows for matching the traffic using L2-L4 flow parameters. Tcl-filter provides a customized method to match traffic flows using iRule commands. The actions can be steering or/and reporting. Steering allows the user to manipulate the traffic when all configured filters match the flow. The steering options can be forwarded (option forwarding), drop/pass(option gate-status), redirect(option http-redirect), or intercept(option intercept). Reporting allows the user to report the usage to different endpoints by different output formats. The reporting options can be gx or hsl. Policy attribute transactional allow policy enforcement for HTTP traffic for each transaction. Quota allows users to do quota management over Gy by specifying the rating group, which has all the parameters associated.

#### EXAMPLES

```
create policy my_policy rules add {
  rule_1 {
    flow-info-filters {
      flow_1 {
        dscp-code 8
      }
      flow_2 {
        dst-port 80
      }
    }
    forwarding {
      endpoint server1
      fallback-action continue
    }
  }
  precedence 1
}
rule_2 {
  reporting {
    dest {
      hsl {
        endpoint-id pem_hsl
        format-script fml
      }
    }
  }
  granularity flow
  volume {
    total 5000
  }
}
precedence 2
}
```

Creates a Policy Enforcement Manager policy named my\_policy with two rules, rule\_1 and rule\_2. rule\_1 defines the flow-info-filters so that when the flow with DSCP is 8 or destination port is 80, the traffic will be forwarded to server1. rule\_2 defines a flow-based reporting rule which will send flow usage record to pem\_hsl endpoint using format script defined in fml whenever total increases by 5000 bytes.

```
delete policy my_policy
```

Deletes the policy named my\_policy.

```
list policy my_policy
```

Displays properties of the policy named my\_policy.

#### OPTIONS

app-service

Specifies the name of the application service to which the policy belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the policy. Only the application service can modify or delete the policy.

description

User defined description.

transactional

Indicate the policy enable or disable policy enforcement for each HTTP transaction.

partition

Displays the administrative partition within which the policy resides.

rules

Adds, deletes, or replaces a set of rules, by specifying a rule name. If a rule by the specified name does not exist, it will be created. You can configure the following options for a rule:

app-service

Specifies the name of the application service to which the rule belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the rule. Only the application service can modify or delete the rule.

classification-filters

Adds, deletes, or replaces a set of classification-filters. You can configure the following options for a classification-

filter.

app-service

Specifies the name of the application service to which the classification-filter belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the rule. Only the application service can modify or delete the classification-filter.

application

Specifies the name of the application where the rule applies to the traffic. The default value is none.

category

Specifies the name of the category of applications where the rule applies to the traffic. The default value is none.

operation

The options match and nomatch indicate the traffic flow must match or not match the condition specified in the classification filter. The default value is match.

dscp-marking-downlink

Specifies the action to modify the DSCP code in the downlink packet when the traffic flow matches the rule matching criteria. The range is 0 to 63, or pass-through. The default value is pass-through, indicating the DSCP code of the downlink packet will not be changed when the traffic flow matches the rule.

dscp-marking-uplink

Specifies the action to modify the DSCP code in the uplink packet when the traffic flow matches the rule matching criteria. The range is 0 to 63, or pass-through. The default value is pass-through, indicating the DSCP code of the uplink packet will not be changed when the traffic flow matches the rule.

dtos-tethering

Defines the device type & OS and tethering detection action and its options.

dtos-detect

Specifies the device type & OS detection to be enabled or disabled. Default is disabled

tethering-detect

Specifies the tethering detection to be enabled or disabled. Default is disabled

report

You can configure the following options for dtos and tethering reporting.

dest You can configure the following options for destination.

hsl You can configure the following options for hsl publisher.

publisher

Specifies the publisher name.

format-script

Specifies the format script name to format the HSL output string format.

ran-congestion

Detect congestion in the Radio Access Network.

detect

Enable or disable the ran congestion detection. Default is disabled.

lowerthreshold-bw

Configured lowerthreshold bandwidth for a session in kbps. Session bandwidth below this value will be marked as congested. Default is 1000kbps.

report

You can configure the following options for ran congestion reporting.

dest You can configure the following options for destination.

hsl You can configure the following options for hsl publisher.

publisher

Specifies the publisher name.

format-script

Specifies the format script name to format the HSL output string format.

flow-info-filters

Adds, deletes, or replaces a set of the flow-info-filters. The flow info filter defines the flow conditions (Layer 4) that the traffic should meet (or not meet) for this enforcement policy rule to apply. You can configure the following options for a flow-info-filter.

**app-service**  
Specifies the name of the application service to which the flow-info-filter belongs. The default value is none.  
Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the rule. Only the application service can modify or delete the flow-info-filter.

**dscp-code**  
Specifies the value of DSCP code which matches incoming traffic based on a value in the DSCP field in the IP header. The range is 0 to 63, or disabled. The default value is disabled, indicating that the DSCP code will not be used to filter the packet in the flow-info-filter.

**dst-ip-addr**  
Specifies the destination IP address and prefix length that the rule applies to. The format is [ip address/prefixlen]. The default value is 0.0.0.0/0.

**dst-port**  
Specifies the destination port against which the packet will be compared. The default value is any.

**from-vlan**  
Specifies the name of the source vlan to match the ingress flow arriving from that vlan.

**l2-endpoint**  
Specifies an L2 endpoint type to be used when matching the traffic flows. The default value is disabled, indicating that L2 endpoint is not used for matching the flows. You can configure the following options:

- disabled**  
Flows are not matched based on the L2 endpoint specification.
- vlan** The vlan name specified in from-vlan is used to match the traffic flows.

**operation**  
Specifies whether the rule applies to traffic that matches (match) or does not match (nomatch) the traffic flow defined here. The options are match and nomatch. The default value is match.

**proto**  
Specifies the protocol that this rule applies to. The options are any, tcp, and udp. The default value is any.

**ip-add-type**  
Specifies the ip address type (IPv4 or IPv6) that this rule applies to. The options are any, IPv4, and IPv6. The default value is any.

**src-ip-addr**  
Specifies the source IP address and prefix length that the rule applies to. The format is [ip address/prefixlen]. The default value is 0.0.0.0/0.

**src-port**  
Specifies the source port of the network you want the rule to affect. The default value is any.

**forwarding**  
Manages the forwarding action and its attributes.

**endpoint**  
Specifies the forwarding endpoint. The endpoint can be icap, pool or route-to-network. Depending on the type chosen flow can be steered to icap server, pool or to the network.

**fallback-action**  
Specifies whether the connection should continue unchanged or should be dropped in the event the forwarding action fails for any reason. The options are: drop or continue, and the default is drop.

**internal-virtual**  
Specifies the internal virtual server name if the type selected is icap.

**icap-type**  
Defines the ICAP adaptation type: request only adaptation, request and response adaptation or both types of adaptations combined.

**type** Specifies the type of forwarding action.

- gate-status**  
Specifies, when set to enabled, that the traffic can pass through the system without being changed. Set disabled to drop traffic that this rule applies to. The options are disabled and enabled. The default is enabled.
- http-redirect**  
Manages the HTTP redirect action and its attributes.
- redirect-url**  
Specifies the HTTP redirection URL.

#### fallback-action

Specifies whether the connection should continue unchanged or should be dropped in the event the forwarding action fails for any reason. The options are: drop or continue, and the default is drop.

#### intercept

Specifies the name of the intercept endpoint.

#### l2-marking-downlink

Set Layer-2 Quality of Service Marking in downlink traffic that matches a rule. Setting a L2 QoS Marking affects the packet delivery priority. The range is 0 to 7, or pass-through. The default value is pass-through, indicating the L2 QoS Marking of the packet will not be changed when the packet matches the rule.

#### l2-marking-uplink

Set Layer-2 Quality of Service Marking in uplink traffic that matches a rule. Setting a L2 QoS marking affects the packet delivery priority. The range is 0 to 7, or pass-through. The default value is pass-through, indicating the L2 QoS Marking of the packet will not be changed when the packet matches the rule.

#### tcp-optimization-uplink

Set tcp optimization profile to be applied to the uplink traffic that matches a rule. The profile name should be one from the common tcp profile list.

#### tcp-optimization-downlink

Set tcp optimization profile to be applied to the downlink traffic that matches a rule. The profile name should be one from the common tcp profile list.

#### tcp-analytics-enable

Specifies the action to enable tcp analytics when the traffic flow matches the rule matching criteria. The options are disabled and enabled. The default is disabled.

#### modify-http-hdr

Specifies the action to modify the HTTP header when the traffic flow matches the rule matching criteria. You can configure the following options for modifying the HTTP header.

**name** Specifies the HTTP header name used by the operation option to modify the HTTP header.

#### operation

Specifies the operation used to modify the HTTP header. The options are insert, none, and remove. The default value is none which indicates that no HTTP header modifications will be made.

#### value-content

Specifies the HTTP header value content used by the operation option to modify the HTTP header. Based on the selected value-type option, the content format will be interpreted either as a string or a tcl snippet. Note: This field is applicable only when the operation option is set to insert.

#### value-type

Specifies the type of content format used in the value-content field. The options are string and tcl-snippet. The default value is string which indicates that the value-content field will be interpreted as a string.

#### insert-content

Specifies the action to insert content into the webpage.

#### duration

Specifies the periodicity of the insert action. Note: This value is useful only when the frequency is set to once-every.

#### frequency

Specifies the frequency of the insert content action. It can take values once, once-every, always.

The options are:

#### always

Specifies if the action need to be applied always on the matched flow.

**once** Specifies if the action need to be applied once per subscriber.

#### once-every

Specifies if the action need to be applied once-every time interval configured in duration per subscriber.

#### position

Specifies the position with respect to the tag name configured. It can take values append, prepend.

#### value-content

Specifies the value content to be inserted into the webpage. Based on the selected value-type option, the content format will be interpreted either as a string or a tcl-snippet.

value-type

Specifies the type of content format used in the value-content field. The options are string and tcl-snippet. The default value is string which indicates that the value-content field will be interpreted as a string.

tag\_name

Specifies the tag name to which the content is either appended or prepended.

precedence

Specifies the precedence for the rule in relation to the other rules. The range is 1 to 4294967295 where 1 has the highest precedence. A rule with higher precedence is evaluated at a high priority. It is mandatory to specify precedence when creating a rule in a policy.

qoe-reporting

You can configure the following options for Quality-of-Experience (QoE) reporting.

dest You can configure the following options for destination.

hsl You can configure the following options for hsl publisher.

publisher

Specifies the publisher name.

format-script

Specifies the format script name to format the HSL output string format.

reporting

You can configure the following options for reporting.

dest You can configure the following options for destination.

gx You can configure the following options for gx endpoint.

application-reporting

Specifies whether the application reporting is enabled. When it is enabled, the APPLICATION\_START and APPLICATION\_STOP Event-Triggers will be reported when the application start/stop is detected. The default value is disabled.

monitoring-key

Specifies the monitoring-key.

hsl You can configure the following options for hsl endpoint.

publisher

Specifies the publisher.

format-script

Specifies the format script name to format the HSL output string format.

session-reporting-fields

Specifies the session fields and their order based on which messages should be published.

3gpp-parameters

Reports the 3gpp-parameters of the session subscriber.

application-id

Reports the application/category ID that is classified for this session.

called-station-id

Reports the called station ID of the session subscriber.

calling-station-id

Reports the calling station ID of the session subscriber.

concurrent-flows

Reports the number of concurrent flows of this session.

downlink-volume

Reports the aggregate incoming bytes for the traffic associated with this session.

duration-seconds

Reports the total duration of all the flows belonging to the traffic

associated with this session.

last-record-sent  
Reports the time (seconds) when sending the last record.

new-flows  
Reports the number of new flows associated with this session since last record.

observation-time-seconds  
Reports the timestamp of the record.

record-reason  
Reports the reason for sending the record.

record-type  
Reports the reporting record type as 3 : session based record.

report-id  
Reports the reporting module ID.

report-version  
Reports the format version of this record.

subscriber-id  
Reports the subscriber ID that of this session.

subscriber-id-type  
Reports the ID type of the subscriber of this session.

successful-transactions  
Reports the total number of successful transactions associated with this session.

terminated-flows  
Reports the total number of terminated flows during this session.

timestamp-msec  
Reports the time stamp on this record in milli-seconds.

total-transactions  
Reports the total number of transactions of this session.

uplink-volume  
Reports the aggregate outgoing bytes for the traffic associated with this session.

flow-reporting-fields  
Specifies the flow fields and their order based on which messages should be published.

application-id  
Reports the application/category ID that is classified for this flow.

destination-ip  
Reports the destination IP address of the traffic.

destination-transport-port  
Reports the destination port of the traffic.

downlink-volume  
Reports the total number of bytes received for this flow by the subscriber.

flow-end-milli-seconds  
Reports the timestamp (milli-seconds) in UNIX time format when the flow ends.

flow-end-seconds  
Reports the timestamp (seconds) in UNIX time format when the flow ends.

flow-start-milli-seconds  
Reports the timestamp (milli-seconds) in UNIX time format when the flow starts.

flow-start-seconds  
Reports the timestamp (seconds) in UNIX time format when the flow starts.

observation-time-seconds  
Reports the timestamp (seconds) of the record.

protocol-identifier  
Reports the transport layer protocol of the flow (TCP or UDP).

record-type  
Reports the reporting record type of the flow: 0 - flow start, 1 - flow end, 2 - flow interim.

report-id  
Reports the reporting module ID.

report-version  
Reports the format version of this record.

route-domain  
Reports the route domain ID of the flow.

source-ip  
Reports the source IP address of the subscriber that initiates the flow.

source-transport-port  
Reports the source port of the subscriber.

subscriber-id  
Reports the subscriber ID that initiates this flow.

subscriber-id-type  
Reports the ID type of the subscriber that initiates this flow.

timestamp-msec  
Reports the timestamp (milliseconds) of the record.

total-transactions  
Reports the total number of transactions of this flow.

uplink-volume  
Reports the number of bytes sent from the subscriber in this flow.

url-category-id  
Reports the ID of the first URL category that is classified for the flow.

vlan-id  
Reports the Vlan ID of the flow.

transaction-reporting-fields  
Specifies the transaction fields and their order based on which messages should be published.

application-id  
Reports the application/category ID that is classified for this transaction.

destination-ip  
Reports the destination IP address of the traffic.

destination-transport-port  
Reports the destination port of the traffic.

downlink-volume  
Reports the number of HTTP response bytes for this transaction.

http-hostname  
Reports the HTTP host name of this traffic.

http-hostname-truncated  
Reports the truncated HTTP host name due to excessive length.

http-response-code  
Reports the HTTP response code of the transaction.

http-url  
Reports the HTTP URL of the transaction.

http-url-truncated  
Reports the truncated HTTP URL of the transaction due to excessive length.

http-user-agent  
Reports the user agent of the HTTP request in this transaction.

http-user-agent-truncated  
Reports the truncated user agent of the HTTP request in this transaction due to excessive length.

protocol-identifier  
Reports the transport layer protocol of the traffic (TCP or UDP).

record-type  
Reports the reporting record type as 10-transactional.

report-id  
Reports the reporting module ID.

report-version  
Reports the format version of the transaction record.

route-domain  
Reports the route domain ID of the traffic.

skipped-transactions  
Reports the number of transactional reports skipped within the flow since the last successfully transmission in the transaction.

source-ip  
Reports the source IP address of the subscriber.

source-transport-port  
Reports the source port of the subscriber.

subscriber-id  
Reports the subscriber ID that initiates this transaction.

subscriber-id-type  
Reports the subscriber ID type of the subscriber that initiates this transaction.

transaction-classification-result  
Reports all the classification tokens from the classification engine.

transaction-end-milli-seconds  
Reports the transaction timestamp (milli-seconds) in UNIX time format when the corresponding HTTP response is received.

transaction-end-seconds  
Reports the transaction timestamp (seconds) in UNIX time format when the corresponding HTTP response is received.

transaction-number  
Reports the sequential number of transaction in this flow (starting from 1).

transaction-start-milli-seconds  
Reports the transaction timestamp (milli-seconds) in UNIX time format when an HTTP request is received.

transaction-start-seconds  
Reports the transaction timestamp (seconds) in UNIX time format when an HTTP request is received.

uplink-volume  
Reports the number of HTTP request bytes for this transaction.

url-category-id  
Reports the ID of the first URL category that is classified for the transaction.

vlan-id  
Reports the Vlan ID of traffic.

radius-accounting  
You can configure the following options for radius-accounting endpoint.

radius-aaa-virtual  
Specifies the internal virtual server for radius-accounting endpoint.

sd You can configure the following options for sd endpoint.

application-reporting  
Specifies whether the application

reporting is enabled. When it is enabled, the APPLICATION START and APPLICATION STOP Event-Triggers will be reported when the application start/stop is detected. The default value is disabled.

**monitoring-key**  
Specifies the monitoring-key.

**granularity**  
Specifies the type of reporting will be generated when the policy applies. The options are flow, session and transaction. The default value is session which indicates the session report will be generated if this policy applies.

**interval**  
Specifies the time interval in seconds the report will be generated. The default value is 0 which indicates this feature is disabled.

**transaction**  
You can configure the following options when the transaction report granularity is selected.

**http** Specifies the HTTP transaction report options for the following HTTP attributes.

**hostname-len**  
Specifies the maximum HTTP hostname string length to include in the HTTP transaction report. The range is 0 to 65535. The default value is 0.

**uri-len**  
Specifies the maximum HTTP URI string length to include in the HTTP transaction report. The range is 0 to 65535. The default value is 256.

**user-agent-max**  
Specifies the maximum HTTP user agent string length to include in the HTTP transaction report. The range is 0 to 65535. The default value is 0.

**volume**  
You can configure the following options for volume threshold. The report will be generated when any of the following conditions happened. If reporting dest is set, either interval must be set to non-0 or one of volume properties must be set to non-0.

**downlink**  
The report will be generated if the downlink traffic exceeds the threshold. The default value is 0 which indicates this feature is disabled.

**total**  
The report will be generated if the uplink and downlink traffic exceeds the threshold. The default value is 0 which indicates this feature is disabled.

**uplink**  
The report will be generated if the uplink traffic exceeds the threshold. The default value is 0 which indicates this feature is disabled.

**quota**  
You can configure the following options for quota management.

**rating-group**  
Specifies the rating-group name.

**reporting-level**  
Specifies the quota reporting level whether per rating group or per service-id.

**qos-rate-pir-downlink**  
Specifies the configured bandwidth control policy for Peak Information Rate (PIR) to apply to downlink traffic that matches this rule. Use none to reset bwc policy name or category name.

**qos-rate-pir-uplink**  
Specifies the configured bandwidth control policy for Peak Information Rate (PIR) to apply to uplink traffic that matches this rule. Use none to reset bwc policy name or category name.

**service-chain**  
Specifies where to forward the traffic affected by this rule.

**tcl-filter**  
Specifies the tcl expression which uses iRule commands to filter the packet. It is a match if tcl-filter returns TRUE/1 or nomatch if FALSE/0. All configured filters (flow-info-filters, classification-filters, and

tcl-filter) must match before rule actions are applied.

**url-categorization-filters**  
Adds, deletes, or replaces a set of url-categorization-filters. You can configure the following options for a url-categorization-filter.

**app-service**  
Specifies the name of the application service to which the url-categorization-filter belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the rule. Only the application service can modify or delete the url-categorization-filter.

**url-category**  
Specifies the name of the url-category of the traffic where the rule applies. The default value is none.

**operation**  
The options match and nomatch indicate the traffic flow must match or not match the condition specified in the classification filter. The default value is match.

**status**  
Specifies the current status of the policy. The options are disabled and enabled. The default value is enabled.

## pem profile diameter-endpoint

**NAME**  
diameter-endpoint - Configures a Diameter endpoint profile.

**MODULE**  
pem profile

**SYNTAX**  
Configures the diameter-endpoint profile within the pem profile module using the syntax shown in the following sections.

```
MODIFY
create diameter-endpoint [name]
modify diameter-endpoint [name]
options:
  defaults-from [ [name] | none]
  destination-host [string]
  destination-realm [string]
  fatal-grace-time {
    options:
  enabled [yes | no]
  time [integer]
  }
  msg-max-retransmits [integer]
  msg-retransmit-delay [integer]
  origin-host [string]
  origin-realm [string]
  pem-protocol-profile-gx [ [profile_name] | none]
  pem-protocol-profile-gy [ [profile_name] | none]
  product-name [string]
  supported-apps [Gx | Gy | Sd]
}

edit diameter-endpoint [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

reset-stats diameter-endpoint
reset-stats diameter-endpoint [ [ [name] | [glob] | [regex] ] ... ]
```

**DISPLAY**

```
list diameter-endpoint
list diameter-endpoint [ [ [name] | [glob] | [regex] ] ... ]
show running-config diameter-endpoint
show running-config diameter-endpoint [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

show diameter-endpoint
show diameter-endpoint [ [ [name] | [glob] | [regex] ] ... ]
  options:
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
    field-fmt
    global
```

#### DESCRIPTION

You can use the diameter-endpoint component to modify or display a diameter-endpoint profile.

#### EXAMPLES

```
create my_diam_endpt defaults-from diameter-endpoint add { Gx }
```

Creates a custom diameter-endpoint profile name `my_diam_endpt` that inherits its settings from the system default diameter-endpoint profile with Gx capability.

```
modify my_diam_endpt origin-host example-host.example-realm.org origin-
realm example-realm destination-host example-peer.peer-realm.org
destination-realm peer-realm.org
```

Modifies the origin-host and destination-host of a diameter-endpoint profile named `my_diam_endpt`.

```
modify my_diam_endpt msg-max-retransmits 8 msg-retransmit-delay 10000
```

Modifies the maximum times a message will be retransmitted to 8 and the retransmission delay to 10 seconds of a diameter-endpoint profile named `my_diam_endpt`.

#### OPTIONS

`defaults-from`  
Specifies the name of the object to inherit the settings from.

`destination-host`  
Specifies the destination host for diameter messages. This should be a FQDN.

`destination-realm`  
Specifies the destination realm for diameter messages. This should be a FQDN.

`fatal-grace-time`  
You can configure following options for `fatal-grace-time`. It defines the period that a diameter connection can be down before all sessions associated with that diameter endpoint are terminated. If the connection is re-established before `fatal-grace-time` seconds then the sessions will not be terminated automatically.

`enabled`  
Specifies whether `fatal-grace-time` option is enabled or no.

`time`  
Specifies the `fatal-grace-time` period in seconds.

`msg-max-retransmits`  
Specifies the number of times an outgoing request message will be retransmitted before being dropped.

`msg-retransmit-delay`  
Specifies the delay in milliseconds after which an unanswered request will be retransmitted.

`origin-host`  
Specifies the origin host for diameter messages. This should be a FQDN.

`origin-realm`  
Specifies the origin realm for diameter messages. This should be a FQDN.

`pem-protocol-profile-gx`  
Specifies PEM protocol profile to be used when subscriber discovery is enabled. This protocol profile defines mapping of Diameter AVPs to subscriber ID and other PEM subscriber session attributes for Diameter application.

`pem-protocol-profile-gy`  
Specifies PEM protocol profile to be used when subscriber discovery is enabled. This protocol profile defines mapping of Diameter AVPs to subscriber ID and other PEM subscriber session attributes for Diameter application.

`product-name`  
Specifies the string used in the product-name AVP in the capabilities exchange messages.

`supported-apps`  
Adds, deletes, or replaces a set of the supported applications. Gx and Sd are mutually exclusive and cannot be added at the same time. When Gx or Sd is added, `pem-protocol-profile-gx` can be

specified for the protocol profile. When Gy is added, pem-protocol-profile-gy can be specified for the protocol profile.

## pem profile radius-aaa

NAME

radius-aaa - Configures a PEM radius AAA profile.

MODULE

pem profile

SYNTAX

Configures the radius-aaa profile within the pem profile module using the syntax shown in the following sections.

CREATE/MODIFY

```
create radius-aaa [name]
modify radius-aaa [name]
options:
  app-service [[string] | none]
  defaults-from [[name] | none]
  description [string]
  retransmission-timeout [integer]
  shared-secret [string]
  password [string]
  transaction-timeout [integer]
```

```
edit radius-aaa [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list radius-aaa
list radius-aaa [ [name] | [glob] | [regex] ] ... ]
show running-config radius-aaa
show running-config radius-aaa [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
show radius-aaa
show radius-aaa [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global
```

DELETE

```
delete radius-aaa [name]
```

DESCRIPTION

You can use the radius-aaa component to create, modify, display, or delete a radius-aaa profile.

EXAMPLES

```
create radius-aaa my_radius_aaa_profile

Creates a custom radius-aaa profile named my_radius_aaa_profile.

list radius-aaa my_radius_aaa_profile

Displays the properties of the radius-aaa profile named
my_radius_aaa_profile.
```

OPTIONS

all Specifies that you want to modify all of the existing components of the specified type.

defaults-from Specifies the profile that you want to use as the parent profile.

Your new profile inherits all settings and values from the parent profile. The default value is radiusaaa.

**description**  
User defined description.

**retransmission-timeout**  
Specifies the retransmission timeout value of the Radius-AAA profile in seconds.

**shared-secret**  
Specifies the shared secret of the Radius-AAA profile when connecting to the RADIUS server.

**password**  
Specifies the password of the Radius-AAA profile for authenticating to the RADIUS server.

**transaction-timeout**  
Specifies the transaction timeout value of the Radius-AAA profile in seconds.

**partition**  
Specifies the administrative partition within which the profile resides.

SEE ALSO

create, delete, edit, glob, list, ltm virtual, modify, regex, reset-stats, show, tmsb

## pem profile spm

**NAME**  
spm - Configures a Subscriber Policy Manager profile.

**MODULE**  
pem profile

**SYNTAX**  
Configures the spm profile within the pem profile module using the syntax shown in the following sections.

**CREATE/MODIFY**

create spm [name]  
modify spm [name]

**options:**

```
app-service [[string] | none]
defaults-from [[name] | none]
description [string]
global-policies-high-precedence [add | delete | replace-all-with] {
    [policy_name ...]
}
global-policies-high-precedence [ default | none ]
global-policies-low-precedence [add | delete | replace-all-with] {
    [policy_name ...]
}
global-policies-low-precedence [ default | none ]
unknown-subscriber-policies [add | delete | replace-all-with] {
    [policy_name ...]
}
unknown-subscriber-policies [ default | none ]
fast-pem [enable | disable]
fast-vs-name [name]
```

edit spm [ [ [name] | [glob] | [regex] ] ... ]  
**options:**  
all-properties  
non-default-properties

reset-stats spm  
reset-stats spm [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**

list spm  
list spm [ [ [name] | [glob] | [regex] ] ... ]  
show running-config spm  
show running-config spm [ [ [name] | [glob] | [regex] ] ... ]  
**options:**  
all-properties  
non-default-properties

```

one-line
partition

show spm
show spm [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global

DELETE
delete spm [name]

DESCRIPTION
  You can use the spm component to create, modify, display, or delete a
  spm profile.

EXAMPLES
  create spm my_spm_profile

  Creates a custom spm profile named my_spm_profile.

  list spm my_spm_profile

  Displays the properties of the spm profile named my_spm_profile.

OPTIONS
  all Specifies that you want to modify all of the existing components
  of the specified type.

  defaults-from
  Specifies the profile that you want to use as the parent profile.
  Your new profile inherits all settings and values from the parent
  profile. The default value is spm.

  description
  User defined description.

  global-policies-high-precedence
  Adds, deletes, or replaces a set of the policies.

  global-policies-low-precedence
  Adds, deletes, or replaces a set of the policies.

  unknown-subscriber-policies
  Adds, deletes, or replaces a set of the policies.

  fast-pem
  Specifies whether fast PEM optimization is enabled or not. The
  default is enabled.

  Specifies whether fast PEM optimization is enabled or not. PEM
  optimization will use the fast-vs-name virtual server for a
  portion of the traffic. The default is enabled.

  fast-vs-name
  Specifies the virtual server which will be used in fast PEM
  optimization when fast-pem is enabled. The virtual server should
  have fastL4 profile attached.

  partition
  Specifies the administrative partition within which the profile
  resides.

SEE ALSO
  edit, glob, list, ltm virtual, modify, pem forwarding-endpoint, pem
  interception-endpoint, pem listener, pem policy, pem profile diameter-
  endpoint, pem reporting format-script, pem service-chain-endpoint, pem

## pem profile subscriber-mgmt

```

NAME
  subscriber-mgmt - Configures a Subscriber Management profile.

MODULE
  pem profile

SYNTAX
  Configures the subscriber-mgmt profile within the pem profile module

```

using the syntax shown in the following sections.

```
CREATE/MODIFY
create subscriber-mgmt [name]
modify subscriber-mgmt [name]
options:
  app-service [(string) | none]
  defaults-from [(name) | none]
  description [string]
  sess-creation-from-server-side [enable | disable]
  drop-unknown-traffic-from-server-side [enable | disable]

edit subscriber-mgmt [ [ (name) | (glob) | (regex) ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list subscriber-mgmt
list subscriber-mgmt [ [ (name) | (glob) | (regex) ] ... ]
show running-config subscriber-mgmt
show running-config subscriber-mgmt [ [ (name) | (glob) | (regex) ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
  sess-creation-from-server-side [enable | disable]
  drop-unknown-traffic-from-server-side [enable | disable]

show subscriber-mgmt
show subscriber-mgmt [ [ (name) | (glob) | (regex) ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global

DELETE
delete subscriber-mgmt [name]

DESCRIPTION
You can use the subscriber-mgmt component to create, modify, display,
or delete a subscriber management profile.

EXAMPLES
create subscriber-mgmt my_subscriber_mgmt_profile

Creates a custom subscriber management profile named
my_subscriber_mgmt_profile.

list subscriber-mgmt my_subscriber_mgmt_profile

Displays the properties of the subscriber management profile named
my_subscriber_mgmt_profile.

OPTIONS
all Specifies that you want to modify all of the existing components
of the specified type.

defaults-from
Specifies the profile that you want to use as the parent profile.
Your new profile inherits all settings and values from the parent
profile. The default value is subscriber-mgmt.

description
User defined description.

sess-creation-from-server-side
Specifies whether session creation from server side is enabled or
not. The default is enabled.

drop-unknown-traffic-from-server-side
Specifies whether drop unknown traffic from server side is enabled
or not. The default is disabled.

partition
Specifies the administrative partition within which the profile
resides.

SEE ALSO
edit, glob, list, ltm virtual, modify, pem forwarding-endpoint, pem
interception-endpoint, pem listener, pem policy, pem profile diameter-
endpoint, pem profile spm, pem reporting format-script, pem service-
chain-endpoint, pem subscriber, regex, show, tmsh

# pem protocol diameter-avp

**NAME**  
diameter-avp - Configures diameter AVPs in Policy Enforcement Manager (PEM).

**MODULE**  
pem protocol

**SYNTAX**  
Configure the diameter-avp component within the pem protocol module using the syntax shown in the following sections.

## CREATE/EDIT/MODIFY

```
create diameter-avp [name]
modify diameter-avp [name]
options:
  app-service [[string] | none]
  avp-code [integer]
  data-type [address | enumerated | float32 | float64 | grouped | integer32 | integer64 | octetstring | rat-type | t
  description [string]
  length [integer]
  parent-avp [ [diameter_avp_name | none]
  vendor-id [integer]
```

```
edit diameter-avp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

## DISPLAY

```
list diameter-avp
list diameter-avp [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

## DELETE

```
delete diameter-avp [name]
```

Note: You must remove all references to a diameter-avp before you can delete the diameter-avp.

## DESCRIPTION

You can use the diameter-avp component to configure Diameter AVP definitions in Policy Enforcement Manager.

## EXAMPLES

```
create diameter-avp user_equipment_value { data-type octetstring avp-
code 460 }
```

Creates a PEM diameter-avp user\_equipment\_value with avp-code 460 and data-type octetstring.

```
delete diameter-avp user_equipment_value
```

Deletes the diameter-avp named user\_equipment\_value.

```
list diameter-avp user_equipment_value
```

Displays the properties of the diameter-avp named user\_equipment\_value.

## OPTIONS

### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

### avp-code

Specifies the avp-code of the Diameter AVP.

### data-type

Specifies the data type of the Diameter AVP. The default value is octetstring.

Note: The 'V' bit, known as the Vendor-Specific bit, indicates whether the optional vendor-id field is present in the AVP header. When set, the AVP code belongs to the specific vendor code address space. The 'V' bit is defined as flag-vendor-specific property in pem protocol profile gx.

The options are:

### address

The address format is derived from the octetstring AVP base format. It is a discriminated union, representing, for example a 32-bit (IPv4) or 128-bit (IPv6) address, most significant octet first. The first two octets of the address AVP represents the AddressType, which contains in address family. The AddressType is used to discriminate the content and format the remaining octets.

### enumerated

Enumerated is derived from the integer32 AVP Base Format. The definition contains a list of valid values and their interpretation and is described in the Diameter application introducing the AVP.

#### float32

This represents floating point values of single precision. The 32-bit value is transmitted in network byte order. The AVP length field MUST be set to 12 (16 if the 'V' bit is enabled).

#### float64

This represents floating point values of double precision. The 64-bit value is transmitted in network byte order. The AVP length field MUST be set to 16 (20 if the 'V' bit is enabled).

#### grouped

The data field is specified as a sequence of AVPs. Each of these AVPs follows - in the order in which they are specified - including their headers and padding. The AVP length field is set to 8 (12 if the 'V' bit is enabled) plus the total length of all included AVPs, including their headers and padding. Thus the AVP length field of an AVP of type grouped is always a multiple of 4.

#### integer32

32 bit signed value, in network byte order. The AVP length field MUST be set to 12 (16 if the 'V' bit is enabled).

#### integer64

64 bit signed value, in network byte order. The AVP length field MUST be set to 16 (20 if the 'V' bit is enabled).

#### octetstring

The data contains arbitrary data of variable length. Unless otherwise noted, the AVP length field MUST be set to at least 8 (12 if the 'V' bit is enabled). AVP Values of this type that are not a multiple of four-octets in length is followed by the necessary padding so that the next AVP (if any) will start on 32-bit boundary.

#### rat-type

specifies the value format to be encoded or decoded as the RAT-Type defined in 3GPP TS 29.212.

time The time format is derived from the octetstring AVP base format. The string MUST contain four octets, in the same format as the first four bytes are in the NTP timestamp format.

#### unsigned32

32 bit unsigned value, in network byte order. The AVP length field MUST be set to 12 (16 if the 'V' bit is enabled).

#### unsigned64

64 bit signed value, in network byte order. The AVP length field MUST be set to 16 (20 if the 'V' bit is enabled).

#### utf8string

The utf8string format is derived from the octetstring AVP base format. This is a human readable string represented using the ISO/IEC IS 10646-1 character set, encoded as an octetstring using the UTF-8 transformation format described in RFC 2279.

#### description

User defined description.

#### length

Specifies the data length of the Diameter AVP.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### parent-avp

Specifies the name of the parent AVP if it is in a grouped AVP.

#### vendor-id

Specifies the vendor-id of the Diameter VSA.

#### SEE ALSO

create, delete, edit, glob, list, modify, pem protocol profile gx, pem protocol profile radius, pem protocol radius-avp, pem subscriber-attribute, regex, show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

# pem protocol profile gx

**NAME**  
gx - Configures a Diameter Gx protocol profile in Policy Enforcement Manager (PEM).

**MODULE**  
pem protocol profile

**SYNTAX**  
Configure the gx component within the pem protocol profile module using the syntax shown in the following sections.

```
CP/CREATE/EDIT/MODIFY
cp gx [source_name] [ destination_name]
create gx [name]
modify gx [name]
  options:
    app-service [[string] | none]
    description [string]
    messages [add | delete | modify | replace-all-with] {
      [message-name] } {
  options:
    direction [any | in | out]
    message-type [ccr-i | cca-i | ccr-u | cca-u | ccr-t | cca-t | rar | raa]
    avps [add | delete | modify | replace-all-with] {
      [ avp-name ] {
        options:
        default [string]
        diameter-avp [ [diameter_avp_name] | none]
        flag-mandatory [disabled | enabled]
        flag-protected [disabled | enabled]
        flag-vendor-specific [disabled | enabled]
        interim-message-include [disabled | enabled]
        parent-label [string]
        reporting-message-include [disabled | enabled]
        subscriber-attr [ [subscriber_attribute_name] | none]
      }
    }
  }
  subscriber-id {
    avp [ [diameter_avp_name] | none]
    type [e164 | imsi | nai | private]
    type-avp [ [diameter_avp_name] | none]
  }
edit gx [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

DISPLAY
list gx
list gx [ [ [name] | [glob] | [regex] ] ... ]
show running-config gx
show running-config gx [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

DELETE
delete gx [name]
```

Note: You must remove all references to a PEM protocol profile gx before you can delete it.

**DESCRIPTION**  
You can use the gx component to configure PEM protocol profile gx definitions in Policy Enforcement Manager.

**EXAMPLES**

```
create cust_gx messages add {my_ccr direction out message-type ccr {
avps add {avp1 { subscriber-attr 3gpp_location diameter-avp
user_equipment_value flag-mandatory enabled} } } }
```

Creates a custom PEM Gx protocol profile cust\_gx and adds a message. The message is defined as CCR on the egress direction. PEM will insert the Diameter AVP as specified in user\_equipment\_value with the value stored subscriber attribute 3gpp\_location with mandatory flag enabled.

```
delete gx cust_gx
```

Deletes the PEM Gx protocol profile named cust\_gx.

```
list gx cust_gx
```

Displays the properties of the PEM Gx protocol profile named cust\_gx.

**OPTIONS**

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**description**  
User defined description.

#### messages

Adds, deletes, or replaces a set of messages which specify mapping of Diameter AVPs to subscriber session attribute for specific Gx message. If a message by the specified name does not exist, it will be created. You can configure the following options for a message:

#### app-service

Specifies the name of the application service to which the message belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the message. Only the application service can modify or delete the message.

#### direction

Specifies the direction of the message.

The options are:

any PEM will process the message in both ingress and egress directions.

in PEM will process the message in ingress direction.

out PEM will process the message in egress direction.

#### message-type

Specifies the type of the message.

The options are:

ccr-i The message is Gx Credit-Control-Request (CCR) Initial.

cca-i The message is Gx Credit-Control-Answer (CCA) Initial.

ccr-u The message is Gx Credit-Control-Request (CCR) Update.

cca-u The message is Gx Credit-Control-Answer (CCA) Update.

ccr-t The message is Gx Credit-Control-Request (CCR) Terminate.

cca-t The message is Gx Credit-Control-Answer (CCA) Terminate.

rar The message is Gx Re-Authorization-Request (RAR).

raa The message is Gx Re-Authorization-Answer (RAA).

avps Adds, deletes, or replaces a set of mapping between Diameter AVPs and PEM subscriber attributes. You can configure the following options.

#### app-service

Specifies the name of the application service to which the AVP belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the avp. Only the application service can modify or delete the avp.

#### default

Specifies the Diameter AVP default value. When inserting the AVP, the default value is used if the corresponding subscriber attribute is not defined or is not present.

#### diameter-avp

Specifies the name of the Diameter AVP. The default value is none.

#### flag-mandatory

Specifies the value of the mandatory flag in the Diameter AVP when inserting into the message. This flag only applies to Diameter AVP in outgoing message.

#### flag-protected

Specifies the value of the protected flag in the Diameter AVP when inserting into the message. This flag only applies to Diameter AVP in outgoing message.

#### flag-vendor-specific

Specifies the value of the vendor-specific flag in the Diameter AVP when inserting into the message. This flag only applies to Diameter AVP in outgoing message.

#### interim-message-include

Specifies whether this AVP needs to be included in the interim-message (ccr-u only) updates which are generated if there is any change related to session parameters. This flag only applies to Diameter AVP in outgoing message.

#### parent-label

Specifies how grouped AVPs can be combined. The AVPs with the same parent-label will be combined in the same grouped AVP.

**reporting-message-include**  
 Specifies whether this AVP needs to be included in the reporting-message (ccr-u only) updates which are generated for reporting usage information. This flag only applies to Diameter AVP in outgoing message.

**subscriber-attr**  
 Specifies the name of the subscriber session attribute to be mapped to Diameter AVP. The default value is none.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**subscriber-id**  
 Specifies how subscriber ID specified by PCRF should be read by PEM.

**avp** Subscription ID comes with type and data in diameter. This field specifies the avp in the message that should be matched to get subscriber ID data in raw format.

**type** Specifies the subscriber ID type (imsi, e164, private) that PEM will use for the session for the ID read by avp.

The options are:

**e164** A numbering plan that defines the format of an MSISDN international phone number (up to 15 digits). The number typically consists of three fields: country code, national destination code, and subscriber number.

**imsi** International Mobile Subscriber Identity. A globally unique code number that identifies a GSM, UMTS, or LTE mobile phone user.

**nai** Network Access Identifier. A fully qualified network name in the form @; identifies a subscriber and the home network to which the subscriber belongs.

**private**  
 The subscriber id type is private for the given deployment.

**type-avp**  
 Subscription ID comes with type and data in diameter. type-avp specifies avp in message that should be matched.

BIG-IP 2016-03-14 pem protocol profile gx(1)

## pem protocol profile radius

**NAME**  
 radius - Configures a RADIUS protocol profile in Policy Enforcement Manager (PEM).

**MODULE**  
 pem protocol profile

**SYNTAX**  
 Configure the radius component within the pem protocol profile module using the syntax shown in the following sections.

```

CP/CREATE/EDIT/MODIFY
cp radius [source_name] [destination_name]
create radius [name]
modify radius [name]
  options:
    app-service [[string] | none]
    description [string]
    messages [add | delete | modify | replace-all-with] {
      [ [message-name] ] {
options:
  direction [any | in | out]
  message-type [acct-req-start | acct-req-stop | acct-req-interim-update]
  avps [add | delete | modify | replace-all-with] {
    [ [avp-name] ] {

```

```

    options:
default [string]
ingress-op [ import | none]
radius-avp [ [radius_avp_name] | none]
subscriber-attr [ [subscriber_attribute_name] | none]
}
}
}
subscriber-id [add | delete | modify | replace-all-with] {
  [ [id-name] ] {
options:
order [integer]
prefix [[string] | none]
radius-avp [[radius_avp_name] | none]
suffix [[string] | none]
}
}
subscriber-id-type [e164 | imsi | nai | private]

```

```

edit radius [ [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties

```

```

DISPLAY
list radius
list radius [ [ [name] | [glob] | [regex] ] ... ]
show running-config radius
show running-config radius [ [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties
one-line
partition

```

```

DELETE
delete radius [name]

```

Note: You must remove all references to a pem protocol profile radius before you can delete it.

#### DESCRIPTION

You can use the radius component to configure pem protocol profile radius definitions in Policy Enforcement Manager.

#### EXAMPLES

```

create cust_acct_start messages add { my_acct_start { direction in
message-type acct-req-start avps add { avp1 { subscriber-attr
_sys_attr_3gpp_imeisv radius-avp _sys_radius_3gpp_imeisv ingress-op
import } } } }

```

Creates a custom PEM RADIUS protocol profile cust\_acct\_start and add a message to define how the RADIUS message can be processed. The message is defined as RADIUS accounting on the ingress direction. The mapping action ingress-op is to extract RADIUS AVP defined in \_sys\_radius\_3gpp\_imeisv and store the value into subscriber attribute \_sys\_attr\_3gpp\_imeisv.

```
delete radius cust_acct_start
```

Deletes the PEM RADIUS protocol profile named cust\_acct\_start.

```
list radius cust_acct_start
```

Displays the properties of the PEM RADIUS protocol profile named cust\_acct\_start.

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**description**  
User defined description.

**messages**  
Adds, deletes, or replaces a set of messages which specify mapping of RADIUS AVPs to subscriber session attributes for specific Gx message. If a message by the specified name does not exist, it will be created. You can configure the following options for a message:

**app-service**  
Specifies the name of the application service to which the message belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the message. Only the application service can modify or delete the message.

**direction**  
Specifies the direction of the message.

The options are:

**any** PEM will process the message in both ingress and egress directions.

**in** PEM will process the message in ingress direction.

out PEM will process the message in egress direction.

**message-type**  
Specifies the type of the message.

The options are:

**acct-req-start**  
The message is RADIUS accounting with the value of Acct-Status-Type AVP set to 1 (Start).

**acct-req-stop**  
The message is RADIUS accounting with the value of Acct-Status-Type AVP set to 2 (Stop).

**acct-req-interim-update**  
The message is RADIUS accounting with the value of Acct-Status-Type AVP set to 3 (Interim-Update).

**avps** Adds, deletes, or replaces a set of mapping between RADIUS AVPs and PEM subscriber attributes. You can configure the following options.

**app-service**  
Specifies the name of the application service to which the avp belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the message. Only the application service can modify or delete the avp.

**default**  
Specifies the RADIUS AVP default value. When inserting the AVP, the default value is used if the corresponding subscriber session attribute is not defined or is not present.

**ingress-op**  
Specifies the ingress operation applied when processing the RADIUS AVP. The default value is none.

The options are:

**import**  
Specifies that the RADIUS AVP will be parsed and the value will be stored in the subscriber attribute.

**none** Specifies that there is no ingress operation applied to the RADIUS AVP.

**radius-avp**  
Specifies the name of the RADIUS AVP. The default value is none.

**subscriber-attr**  
Specifies the name of the subscriber session attribute to be mapped to RADIUS AVP. The default value is none.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**subscriber-id**  
Adds, deletes, or replaces a set of RADIUS AVPs to form PEM subscriber ID. You can configure the following options:

**order**  
Specifies the order of RADIUS AVPs when constructing the subscriber ID.

**prefix**  
Specifies the prefix string when constructing subscriber ID with the value of the RADIUS AVP.

**radius-avp**  
Specifies the value of RADIUS AVP which will be used to construct the subscriber ID.

**suffix**  
Specifies the suffix string when constructing subscriber ID with the value of the RADIUS AVP.

**subscriber-id-type**  
Specifies the subscriber ID type session attribute value for the session created.

The options are:

**e164** A numbering plan that defines the format of an MSISDN international phone number (up to 15 digits). The number typically consists of three fields: country code, national destination code, and subscriber number.

**imsi** International Mobile Subscriber Identity. A globally unique code number that identifies a GSM, UMTS, or LTE mobile phone user.

**nai** Network Access Identifier. A fully qualified network name in the form @; identifies a subscriber and the home network to which the subscriber belongs.

**private**  
The subscriber id type is private for the given deployment.

## pem protocol radius-avp

### NAME

radius-avp - Configures RADIUS AVPs in Policy Enforcement Manager (PEM).

### MODULE

pem protocol

### SYNTAX

Configure the radius-avp component within the pem protocol module using the syntax shown in the following sections.

#### CREATE/EDIT/MODIFY

```
create radius-avp [name]
modify radius-avp [name]
```

#### options:

```
app-service [[string] | none]
data-type [3gpp-rat-type | 3gpp-user-location-info | integer | ipaddr | ipv6addr | ipv6prefix | octet | string | t
description [string]
max-length [integer]
min-length [integer]
type [integer]
vendor-id [integer]
vendor-type [integer]
```

```
edit radius-avp [ [ [name] | [glob] | [regex] ] ... ]
```

#### options:

```
all-properties
non-default-properties
```

#### DISPLAY

```
list radius-avp
list radius-avp [ [ [name] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties
one-line
partition
```

#### DELETE

```
delete radius-avp [name]
```

Note: You must remove all references to a radius-avp before you can delete the radius-avp.

### DESCRIPTION

You can use the radius-avp component to configure RADIUS AVP definitions in Policy Enforcement Manager.

### EXAMPLES

```
create radius-avp imeisv { data-type string type 26 vendor-id 10415
vendor-type 20 }
```

Creates a PEM radius-avp imeisv which is an Vendor Specific Attribute of 3GPP with type value 26.

```
delete radius-avp imeisv
```

Deletes the radius-avp named imeisv.

```
list radius-avp imeisv
```

Displays the properties of the radius-avp named imeisv.

### OPTIONS

#### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

#### data-type

Specifies the data type of the RADIUS AVP. The default value is

string.

The options are:

**3gpp-rat-type**

specifies the value format to be encoded or decoded as the 3GPP-RAT-Type defined in 3GPP TS 29.061.

**3gpp-user-location-info**

specifies the value format to be encoded or decoded as the 3GPP-User-Location-Info defined in 3GPP TS 29.061.

**integer**

32-bit unsigned integer in network byte order.

**ipaddr**

IPv4 address in network byte order.

**ipv6addr**

IPv6 address in network byte order.

**ipv6prefix**

IPv6 prefix data format is defined in RFC 3162.

**octet**

UTF-8 text [RFC3629], totaling 253 octets or less in length.

**string**

string (i.e., binary data), totaling 253 octets or less in length. This includes the opaque encapsulation of data structures defined outside of RADIUS.

**time** time as a 32-bit unsigned value in network byte order and in seconds since 00:00:00 UTC, January 1, 1970.

**description**

User defined description.

**max-length**

Specifies the maximum data length of the RADIUS AVP/VSA. It doesn't include the AVP/VSP header. The default value is 253.

**min-length**

Specifies the minimum data length of the RADIUS AVP/VSA. It doesn't include the AVP/VSP header. The default value is 1.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**type** Specifies the type of the RADIUS AVP. 26 is for vendor specific attribute (VSA).

**vendor-id**

Specifies the vendor-id of the RADIUS VSA. This property is mandatory if type is 26.

**vendor-type**

Specifies the vendor-type of the RADIUS VSA. This property is mandatory if type is 26.

## **pem quota-mgmt rating-group**

**NAME**

rating-group - Configures a rating-group for quota management in Policy Enforcement Manager (PEM).

**MODULE**

pem quota management

**SYNTAX**

Modify the rating-group component within the pem quota-mgmt module using the syntax shown in the following sections.

**CREATE/MODIFY**

create rating-group [name]

```

modify rating-group [name]
options:
  app-service [[string] | none]
  rating-group-id [integer]
  description [string]
  request-on-install [yes | no]
  default-threshold [integer]
  default-validity-time [integer]
  default-quota-holding-time [integer]
  initial-quota-request {
interval [integer]
volume {
  input-octets
  output-octets
  total-octets
}
default-quota {
interval [integer]
volume {
  input-octets
  output-octets
  total-octets
}
time {
usage-time
consumption-time
}
default-breach-action [terminate | allow | redirect]
default-forwarding-endpoint [name]

```

```

edit rating-group [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

```

```

DISPLAY
list rating-group
list rating-group [ [ [name] | [glob] | [regex] ] ... ]
show running-config rating-group
show running-config rating-group [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

```

```

DELETE
delete rating-group [name]

```

Note: You must remove all references to a rating-group object before you can delete it.

#### EXAMPLES

```

create rating-group rg1 {
rating-group-id 1
initial-quota-request {
  volume {
input-octets 1000 output-octets 1000
total-octets 2000
}
}
default-quota {
  volume {
input-octets 1000 output-octets 1000
total-octets 2000
}
}
request-on-install yes }

```

Creates a PEM rating-group named rg1.

```
delete rating-group rg1
```

Deletes the rating-group named rg1.

```
list rating-group rg1
```

Displays the properties of the rating-group named rg1.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### rating-group-id

Specifies the rating-group-id that will be used by quota managing endpoint. For instance, this could be the rating group in case of Gy endpoint.

##### request-on-install

Specifies whether quota has to be requested from the quota managing endpoint (Eg : Gy) when policy referring to this rating-group is installed for a subscriber or later when flow is initiated.

##### default-threshold

Specifies the default threshold if the quota managing endpoint does not specify threshold.

##### default-validity-time

Specifies the default validity time for the quota in seconds if

OCS did not specify it.

**default-quota-holding-time**  
Specifies the default quota holding time in seconds for which quota is valid without any usage if not specified by OCS.

**initial-quota-request**  
Specifies the initial quota, that will be requested from the quota managing endpoint. Could be either time or volume.

**time** Specifies the time in seconds.

**volume**  
You can configure the following options for volume initial quota.

**output-octets**  
Specifies the initial quota for downlink traffic.

**total-octets**  
Specifies the initial quota for total uplink and downlink traffic.

**input-octets**  
Specifies the initial quota for uplink traffic.

**default-quota**  
Specifies the default quota, that will be used if quota managing endpoint does not respond. Could be either time or volume.

**time** Specifies the quota in time.

**usage-time**  
Specifies the usage time in seconds.

**consumption-time**  
Specifies the quota consumption time in seconds.

**volume**  
You can configure the following options for volume default quota.

**output-octets**  
Specifies the default quota for downlink traffic.

**total-octets**  
Specifies the default quota for total uplink and downlink traffic.

**input-octets**  
Specifies the default quota for uplink traffic.

## pem reporting format-script

**NAME**  
`format-script` - Configures format scripts for the Policy Enforcement Manager (PEM).

**MODULE**  
`pem reporting`

**SYNTAX**  
Modify the `format-script` component within the `pem reporting` module using the syntax shown in the following sections.

**CREATE/MODIFY**  
`create format-script [name]`  
`modify format-script [name]`  
**options:**  
`app-service [[string] | none]`  
`definition [string]`  
`description [string]`

`edit format-script [ [name] | [glob] | [regex] ] ... ]`  
**options:**  
`all-properties`

## non-default-properties

### DISPLAY

```
list format-script
list format-script [ [ [name] | [glob] | [regex] ] ... ]
show running-config format-script
show running-config format-script [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

### DELETE

```
delete format-script [name]
```

Note: You must remove all references to a format script object before you can delete it.

### DESCRIPTION

You can use the format-script component to create scripts for HSL reporting. The scripts use TCL syntax and define a custom format that is applied in an enforcement policy rule. The format and fields available differ depending on whether the rule specifies session-based or flow-based reporting.

### EXAMPLES

```
create format-script fml { definition { return "(flow app_id[PEM::flow
stats reported app-id], bytes-in:[PEM::flow stats reported bytes-in])"
} }
```

Creates a PEM reporting format script named fml.

```
delete format-script fml
```

Deletes the format script named fml.

```
list format-script fml
```

Displays the properties of the format script named fml.

### OPTIONS

#### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

#### definition

Specifies a script using TCL syntax that defines a custom format for HSL reporting applied in an enforcement policy rule. The format and fields available differ depending on whether you are using session-based or flow-based reporting in the rule.

#### Session-based formats:

The options are:

#### app-id

Specifies the application id of the session record.

#### bytes-in

Specifies the aggregate incoming bytes of the session.

#### bytes-out

Specifies the aggregate outgoing bytes of the session.

#### last-send-sec

Specifies the value of seconds of the timestamp since the previous record was sent.

#### last-send-usec

Specifies the value of microseconds of the timestamp since the previous record was sent.

#### param-3gpp

Specifies the comma-separated string of the value of imsi, imeisv, tower-id, and user-name.

#### rec-reason

Specifies the reason for sending report. The values are 1: period time, 2: volume threshold, 3: subscriber logout, 4: inactivity.

#### rec-type

Specifies the type of the session-based record (always 3).

#### subs-id

Specifies the subscriber id.

#### subs-id-type

Specifies the subscriber id type (e164, imsi, nai, or private).

#### timestamp-sec

Specifies the seconds value of the timestamp when the record was generated. The Unix epoch is 1970-01-01T00:00:00Z.

#### timestamp-usec

Specifies the microseconds value of the timestamp when the record was generated.

Flow-based formats:

The options are:

**app-id**  
Specifies the application id of the flow record.

**bytes-in**  
Specifies the aggregate incoming bytes of the flow.

**bytes-out**  
Specifies the aggregate outgoing bytes of the flow.

**dst-ip**  
Specifies the destination ip address of the flow.

**dst-port**  
Specifies the destination port of the flow.

**proto**  
Specifies the protocol of the flow.

**rec-type**  
Specifies the type of the flow-based record. The value is 0: flow init, 1: flow interim, and 2: flow end.

**src-ip**  
Specifies the source ip address of the flow.

**src-port**  
Specifies the destination port of the flow.

**subs-id**  
Specifies the subscriber id.

**subs-id-type**  
Specifies the subscriber id type (e164, imsi, nai, or private).

**flow-start-time-sec**  
Specifies the seconds value of the timestamp when the flow starts. The Unix epoch is 1970-01-01T00:00:00Z.

**flow-start-time-usec**  
Specifies microseconds value of the timestamp when the flow starts.

**flow-end-time-sec**  
Specifies the seconds value of the timestamp when the flow ends. The Unix epoch is 1970-01-01T00:00:00Z.

**flow-end-time-usec**  
Specifies microseconds value of the timestamp when the flow ends.

**timestamp-sec**  
Specifies the of seconds value of the timestamp when the record was generated. The Unix epoch is 1970-01-01T00:00:00Z.

**timestamp-usec**  
Specifies the microseconds value of the timestamp when the record was generated.

**description**  
Specifies a user-defined description.

## pem service-chain-endpoint

NAME

service-chain-endpoint - Configures service chain endpoints for the Policy Enforcement Manager (PEM).

MODULE

pem

## SYNTAX

Modify the service-chain-endpoint component within the pem module using the syntax shown in the following sections.

### CREATE/MODIFY

```
create service-chain-endpoint [name]
modify service-chain-endpoint [name]
  options:
    app-service [[string] | none]
    service-endpoints [add | delete | modify | replace-all-with] {
    [service endpoint name ... ] {
      options:
        app-service [[string] | none]
        forwarding-endpoint
          to-endpoint [forwarding endpoint name]
        from-vlan [vlan name]
        http-adapt-service
          internal-virtual [internal virtual server | none]
          icap-type [request | response | both | none]
        order [integer]
        service-option [optional | mandatory]
        steering-policy [policy name | none]
      }
    }
edit service-chain-endpoint [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

DISPLAY
list service-chain-endpoint
list service-chain-endpoint [ [ [name] | [glob] | [regex] ] ... ]
show running-config service-chain-endpoint
show running-config service-chain-endpoint [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

DELETE
delete service-chain-endpoint [name]
```

Note: You must remove all references to a service-chain-endpoint before you can delete the service-chain-endpoint.

## DESCRIPTION

You can use the service-chain-endpoint component to configure service-chain-endpoint definitions for the Policy Enforcement Manager (PEM). Each service-chain-endpoint consists of one or more service-endpoints, where a service-endpoint consists of a non-zero integer order, existing from-vlan a valid fwd-endpoint or a http-adaptation-service endpoint. When you configure a BIG-IP that has a service-chain-endpoint with multiple service-endpoints, traffic will pass through different endpoints chosen dynamically.

Note: You must create a valid forwarding-endpoint and a valid vlan before you can create a service-endpoint. If you are enabling http-adapt-service, you must create Request Adapt and Response Adapt profiles and attach to the traffic virtual. Also create an internal-virtual and enable icap profile. You must also give each service-endpoint an order from 1 up to 2<sup>32</sup>-1. The lower the service-endpoint order is, the higher its precedence is (i.e., traffic will pass through it before other higher order service-endpoints). Each service-endpoint has a boolean (true/false) service-option that defines what would happen if the service-endpoint is down. If service-option is mandatory, the traffic flow is dropped if the service-endpoint is down. If service-option is optional, the traffic flow will be bypassed to the next available service-endpoint.

For more information about how to create a vlan, please refer to net vlan. Also please refer to pem forwarding-endpoint for more information about how to create a pem forwarding-endpoint.

## EXAMPLES

```
create service-chain-endpoint chain1 service-endpoints add { ser_ep1 {
order 10 from-vlan vlan1 forwarding-endpoint { to-endpoint fw_ep1 }
service-option optional } ser_ep2 { order 5 from-vlan vlan2 http-adapt-
service {internal-virtual iv1} service-option mandatory } }
```

Creates a PEM service-chain-endpoint named chain1 that has two service-endpoints: ser\_ep1 and ser\_ep2. The first ser\_ep1 has an order of 10 and is optional and has forwarding-endpoint with to-endpoint fw\_ep1, type transparent and vlan1 as a from-vlan. The second ser\_ep2 has an order of 5 is mandatory and has http-adapt-service enabled with ivs1 as internal-server and vlan2 as a from-vlan. Note that ser\_ep2 will precede ser\_ep1 because the lower the service-endpoint order is, the higher its precedence is.

```
delete service-chain-endpoint chain1
```

Deletes the service-chain-endpoint named chain1.

```
list service-chain-endpoint chain1
```

Displays the properties of the service-chain-endpoint named chain1.

## OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates

option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

#### service-endpoints

Adds, deletes, or replaces a set of the service endpoints by specifying a series of service-endpoint names. If any of these names did not exist before, then new names will be created. Each service-endpoint is identified by a vlan and a forwarding-endpoint.

#### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

#### forwarding-endpoint

Specifies the forwarding endpoint attributes to be set. The below attributes can be set:

#### to-endpoint

This is a default endpoint that will be chosen if steering policy is not configured. You have to create a valid PEM forwarding-endpoint before you can add to-endpoint to a service-endpoint.

#### from-vlan

Specifies the vlan that the traffic will come from toward the service-endpoint. Note: The vlan has to exist before you can create a from-vlan field.

#### http-adapt-service

Specifies the option to set attributes for http adapt services. Below are the attributes that can be set.

#### internal-virtual

This is the internal virtual on which icap is enabled. You have to create the internal-virtual and assign icap profile before adding here.

#### icap-type

Defines the ICAP adaptation type: request only adaptation, request and response adaptation or both types of adaptations combined.

#### order

Specifies the order of the service-endpoint among other service-endpoints. The lower the service-endpoint's order is, the more precedence it has (i.e., the traffic will go through the lowest-ordered service-endpoint first, then through higher order service-endpoint, ... etc.).

#### service-option

Specifies the behavior when a service-endpoint is not available (i.e., is down). This option is limited when ICAP is defined as the service-endpoint and will not apply if the ICAP service is unavailable. You can configure the following options:

#### mandatory

If the service-endpoint is down, the traffic flow is dropped.

#### optional

If the service-endpoint is down, the traffic flow will be bypassed to the next available service-endpoint.

#### steering-policy

If the steering policy is configured, the policy is evaluated and if steering is enabled the flow will be steered to the corresponding endpoint.

BIG-IP 2016-01-07 pem service-chain-endpoint(1)

NAME

sessiondb - Displays, deletes, modifies, and reset-stats a PEM subscriber session record on the BIG-IP(r) system.

MODULE

pem

DESCRIPTION

You can use the sessiondb component to display session record on the BIG-IP system. Additionally, you can delete, reset-stats and modify a specified session record. The subscriber-id or session-ip or all and/or the filtering arguments can be specified as the query key. session-state must be specified in modify command.

When specifying an IP address in show/delete/modify/reset-stats sessiondb session-ip commands, the route domain ID may be optionally included. The route domain ID follows the IP address and is separated by '%'. For example, 10.10.10.100%5 is an IP address in route domain 5.

Note: show and reset-stats commands apply to both static and dynamic subscribers. Delete and modify commands only apply to dynamic subscribers. The session of static subscribers cannot be deleted. The session-state of static subscribers cannot be changed. To delete a static subscriber session you have to delete the static subscriber configuration in pem subscriber.

SHOW command

SYNTAX

show sessiondb subscriber-id []

show sessiondb session-ip /[[] []

show all

options:

all-properties  
field-fmt

DESCRIPTION

Used to display the session information.

subscriber-id can either be the complete subscriber-id or a wildcard.

session-ip be either the complete IP address, or a subnet, by specifying the prefix.

all is used to display all the sessions. Due to existing limitations, some of the arguments cannot be used with the 'all' option. In this case, 'subscriber-id \*' can be used.

all-properties options enables the per-IP traffic statistics in case of sessions with multiple IP addresses.

field-fmt option provides a structured output. This option is used for REST API compatibility.

args is an optional list of arguments, which can contain the following-

- filtering arguments: These specify the criteria for selecting sessions to display. The filtering arguments can be one or more of the following

- . imsi
- . imeisv
- . calling-station-id
- . called-station-id
- . user-name
- . session-origin
- . session-state
- . device-name
- . device-os
- . user-location-info

This can either be the user location as a hex string, or the location info broken down into individual fields as name value pairs. The values can be combined using '&' or '|' and can have only one of the operators, not both. The key value pairs allowed are as follows ( 'D' stands for a decimal value and 'H' for hex digit) -

- type=[CGI | SAI | RAI | TAI | TAI+ECGI] - mcc=DD[D] -  
mcc=DD[D] - lac=[0x]HHHH - ci=[0x]HHHH - sac=[0x]HHHH -  
rac=[0x]HHHH - tac=[0x]HHHH - eci=[0x]HHHHHHH

For e.g.

user-location-info 0x1234567 user-location-info  
type=CGI&mcc=123 user-location-info  
type=TAI+ECGI|mcc=123|lac=0x3f5d

This is not allowed -

user-location-info type=CGI&mcc=123|mcc=456

. attr

This is the list of custom attribute key-value pairs. Multiple attributes can be combined with either '&' or '|'. (cannot have a mix of '&' and '|' operators). There can be a maximum of 30 custom attributes.

. policy

List of policy names. This can again be combined using the '&' or '|' operators. There can be maximum of 30 policies.

- . blade
- . tmm
  - include-deleted: This specifies whether to include sessions marked for deletion in the output.
  - view-mode: This specifies the format of the output and can be one of extended, table or count. The extended view mode is the default and gives a formatted output of all the session attributes and flow statistics. In the table mode, the user can select the information to be displayed by selecting the list of columns. In this mode, the 'columns' argument HAS to be specified containing the list of columns to display. Column names should be separated by ':' and should be from the following list -
- . subscriber\_id
- . tmm\_number
- . blade\_number
- . session\_state\_str
- . session\_origin\_str
- . ppe\_session\_id
- . qpe\_session\_id
- . imsi
- . imeisv
- . called\_station\_id
- . calling\_station\_id
- . user\_name
- . device\_name
- . device\_os
- . tower\_id
- . ip\_info.ip\_address
- . policy\_info.policy\_name
- . any custom attribute e.g. \_sys\_attr\_3gpp\_rat\_type.

Any unknown column name is considered to be a custom attribute name.

If the view-mode is set to count, then only a count of the number of sessions matching the specified criteria is displayed.

- max-count: This is used to specify an upper limit on the number of matching sessions to be considered for the command.
- resume-from: This argument is used to get a page-by-page listing of the sessions, and can be used only with the field-fmt option.

#### DELETE command

##### SYNTAX

```
delete sessiondb subscriber-id []
delete session-ip [ip address>/[] []]
delete all
```

##### DESCRIPTION

Used to delete sessions.

The optional arguments here can specify the filtering arguments, as explained in the show command above.

All the sessions matching the criteria are deleted.

#### MODIFY command

##### SYNTAX

```
modify sessiondb subscriber-id [] session-state
[marked-for-deletion | not-provisioned | provisioned | provisioning-
pending ]
modify session-ip [ip address>/[] []] session-state
[marked-for-deletion | not-provisioned | provisioned | provisioning-
pending ]
```

##### DESCRIPTION

Used to modify the session state.

The optional arguments here can specify the filtering arguments, as explained in the show command above.

The state of all the matching sessions are modified to the value specified.

session-state

Specifies the new subscriber session state.

The options are:

marked-for-deletion

Specifies that the subscriber session should be scheduled for deletion.

provisioned

Specifies that the subscriber session state should be marked as provisioned, regardless of whether the policies have been assigned or not. The unknown subscriber policies are not applied to the subscriber flows, even if no subscriber policies are provisioned.

not-provisioned

Specifies that the subscriber session state should be marked as not-provisioned. No further attempts to provision the session are made. The unknown subscriber policies are applied to the subscriber flows.

provisioning-pending

Specifies that the subscriber session state should be marked as being in the process of provisioning. This will trigger a session provisioning request (e.g. Gy CCR request) immediately. If no response is received, or the provisioning process fails for any reason, another request will be sent after the retry timeout, until the session is provisioned successfully, or the number of retries is reached.

RESET-STATS command

SYNTAX

```
reset-stats sessiondb subscriber-id []
```

```
reset-stats session-ip [ip address>/[] []
```

```
reset-stats all
```

DESCRIPTION

Used to reset the session statistics.

The optional arguments here can specify the filtering arguments, as explained in the show command above.

The statistics for all the sessions matching the criteria are reset.

EXAMPLES

```
show sessiondb subscriber-id 4085551212
```

Displays the session record of subscriber id 4085551212.

```
show sessiondb subscriber-id 408*
```

Displays the session record of all subscribers with id beginning with '408'.

```
show sessiondb subscriber-id *
```

Displays the session records of all subscribers.

```
show sessiondb session-ip 10.10.10.100
```

Displays the session record of session ip address 10.10.10.100.

```
show sessiondb session-ip 10.10.10.100%5
```

Displays the session record of session ip address 10.10.10.100 in route domain 5.

```
show sessiondb session-ip 10.10.10.10/24
```

Displays the session records of session ip addresses in the 10.10.10.0 subnet.

```
show sessiondb subscriber-id 4085551212 all-properties
```

Displays the session record of subscriber id 4085551212, and statistics for each IP.

```
show sessiondb session-ip 10.10.10.100 all-properties
```

Displays the session record of session ip address 10.10.10.100, and statistics for each IP.

```
show sessiondb session-ip 10.10.10.10/24 view-mode count
```

Displays the count of the number of session records with session ip address in the 10.10.10.0 subnet.

```
show sessiondb subscriber-id 408* session-state provisioned
```

Displays the count of the number of sessions whose id begins with '408' and are in the provisioned state.

```
delete sessiondb subscriber-id 4085551212
```

Deletes the session record of subscriber id 4085551212.

```
delete sessiondb session-ip 10.10.10.100
```

Deletes the session record of IP address 10.10.10.100.

```
delete sessiondb session-ip 10.10.10.100%5
```

Deletes the session record of IP address 10.10.10.100 in route domain 5.

```
delete sessiondb session-ip session-state provisioning-pending
```

Deletes all sessions that are in the provision pending state.

```
reset-stats sessiondb subscriber-id 4085551212
```

Reset the session statistics of subscriber id 4085551212. Flows Current specifies the active flows and it cannot be reset.

```
modify sessiondb subscriber-id 4085551212 session-state provisioned
```

Modifies the session state of subscriber id 4085551212 to provisioned.

```
modify sessiondb subscriber-id 408* session-state provisioned
```

Modifies the session state of sessions with subscriber id starting with 408 to state provisioned.

## pem stats action

**NAME**  
action - Displays and resets PEM policy action statistics.

**MODULE**  
pem stats

**SYNTAX**  
Display statistics for the action component within the pem stats module using the syntax in the following section.

**DISPLAY**  
show action  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the action component to display PEM policy action statistics. The statistics details are described below:

Pass Specifies the number of flows that are passed (gate enabled).

Drop Specifies the number of flows that are dropped (gate disabled).

Clone  
Specifies the number of flows to which clone actions apply.

HTTP Redirect  
Specifies the number of flows to which redirection actions apply.

ICAP Request  
Specifies the number of flows to which ICAP actions apply on the request direction.

ICAP Response  
Specifies the number of flows to which ICAP actions apply on the response direction.

Steering  
Specifies the number of flows to which steering actions apply.

Service Chain  
Specifies the number of flows to which steering endpoint actions apply.

Steering on Response  
Specifies the number of flows to which steering actions apply on the response direction.

QoS Uplink  
Specifies the number of uplink flows to which QoS actions apply. Uplink means to network.

**QoS Downlink**  
Specifies the number of downlink flows to which QoS actions apply.  
Downlink means to subscriber.

**DSCP Marking Uplink**  
Specifies the number of uplink flows with DSCP action applies.

**DSCP Marking Downlink**  
Specifies the number of downlink flows with DSCP action applies.

**HTTP Headers Modify**  
Specifies the number of HTTP Headers Modify actions.

**Insert Content**  
Specifies the number of Insert Content actions.

**iRule**  
Specifies the number of iRule actions.

**L2 Marking Uplink**  
Specifies the number of uplink flows to which L2 Marking actions apply.

**L2 Marking Downlink**  
Specifies the number of downlink flows to which L2 Marking actions apply.

**Flow Reporting**  
Specifies the number of actions of flow reporting record generation applied.

**Session Reporting**  
Specifies the number of actions of session record generation applied.

**Transaction Reporting**  
Specifies the number of actions of transaction record generation applied.

**Policy Re-evaluation Rate (count/min)**  
Specifies the number of successful policy reevaluations per minute.

**Policy Re-evaluation Rate Maximum**  
Specifies the maximum number of policy reevaluations overall for all subscribers and flows.

**Media Quality-of-experience (QoE)**  
Specifies the number of actions of media Quality-of-experience (QoE) record generation applied.

You can reset the PEM policy action statistics using reset-stats command.

#### EXAMPLES

show action

Displays the PEM policy action statistics.

reset-stats action

Resets the PEM policy action statistics.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, pem stats gx, pem stats gy, pem stats hsl, pem stats radius, pem stats subscriber, tmsh

## pem stats dtos

**NAME**  
dtos - Displays and resets PEM dtos statistics.

**MODULE**  
pem stats

**SYNTAX** Display statistics for the dtos component within the pem stats module using the syntax in the following section.

**DISPLAY**  
show dtos  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the dtos component to display PEM dtos statistics. The statistics details are described below:

**TAC Database**  
Specifies the number of TAC database queries and successful lookups since the last reset of the counter.

**Customdb**  
Specifies the number of custom TAC database queries and successful lookups since the last reset of the counter.

**Default/Licensed**  
Specifies the number of default/licensed TAC database queries and successful lookups since the last reset of the counter.

**TCP Fingerprint**  
Specifies the number of TCP fingerprint queries and successful OS identification since the last reset of the counter.

**User-agent**  
Specifies the number of user-agent queries and successful OS identification since the last reset of the counter.

You can reset the PEM dtos statistics using reset-stats command.

**EXAMPLES**  
show dtos

Displays the PEM dtos statistics.

reset-stats dtos

Resets the PEM dtos statistics.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, pem stats action, pem stats gx, pem stats gy, pem stats radius, pem stats subscriber, pem stats hsl, tmsh

## **pem stats gx**

**NAME**  
gx - Displays and resets PEM gx statistics.

**MODULE**  
pem stats

**SYNTAX**  
Display statistics for the gx component within the pem stats module using the syntax in the following section.

**DISPLAY**  
show gx  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the gx component to display PEM gx statistics. The Current column represents count of Gx sessions that exist at the moment. The Max column represents maximal count of Gx sessions that ever existed at the same time. The Total column represents total count of Gx sessions that existed or messages that were sent or received since the start or the last statistics reset. The Retries column represents total count of retransmitted Gx messages. The Errors column represents total count of received Gx messages that were invalid or outgoing Gx messages that could not be sent. The statistics details are described below:

Gx sessions  
Specifies the number of all Gx sessions established.

Provisioned Gx sessions  
Specifies the number of provisioned Gx sessions.

Provisioning pending Gx sessions  
Specifies the number sessions for which provisioning or creation over Gx has been initiated.

Not provisioned Gx sessions  
Specifies the number of not provisioned Gx sessions, i.e. all existing Gx sessions that have not been provisioned.

Provisioning failed Gx sessions  
Specifies the number of inactive Gx sessions for which provisioning or creation error happened.

Termination pending Gx sessions  
Specifies the number of Gx sessions for which close is initiated.

Terminated Gx sessions  
Specifies the total number of Gx sessions terminated since the last reset of the counter.

CCR Sent  
Specifies the number of Credit-Control-Request (CCR) requests of all types sent.

CCR Initial Sent  
Specifies the number of Credit-Control-Request (CCR) Initial requests sent since the last reset of the counter.

CCR Update Sent  
Specifies the number of Credit-Control-Request (CCR) Update requests sent since the last reset of the counter.

CCR Usage Monitoring Sent  
Specifies the number of Credit-Control-Request (CCR) requests with usage monitoring report sent.

CCR Application Start Sent  
Specifies the number of Credit-Control-Request (CCR) requests with application start report sent.

CCR Application Stop Sent  
Specifies the number of Credit-Control-Request (CCR) requests with application stop report sent.

CCR Termination Sent  
Specifies the number of Credit-Control-Request (CCR) Termination requests sent since the last reset of the counter.

CCA Received  
Specifies the number of Credit-Control-Answer (CCA) responses of all types received.

CCA Initial Received  
Specifies the number of Credit-Control-Answer (CCA) Initial responses received since the last reset of the counter.

CCA Update Received  
Specifies the number of Credit-Control-Answer (CCA) Update responses received since the last reset of the counter.

CCA Usage Monitoring Received  
Specifies the number of Credit-Control-Answer (CCA) responses with usage monitoring report ack received.

CCA Termination Received  
Specifies the number of Credit-Control-Answer (CCA) Termination responses received since the last reset of the counter.

RAR Received  
Specifies the number of Re-Auth-Request (RAR) requests received.

RAA Sent  
Specifies the number of Re-Auth-Answer (RAA) responses sent.

You can reset the PEM gx statistics using reset-stats command.

#### EXAMPLES

```
show gx
```

Displays the PEM gx statistics.

```
reset-stats gx
```

Resets the PEM gx statistics.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

## **pem stats gy**

**NAME**  
gy - Displays and resets PEM gy statistics.

**MODULE**  
pem stats

**SYNTAX**  
Display statistics for the gy component within the pem stats module using the syntax in the following section.

**DISPLAY**  
show gy  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the gy component to display PEM gy statistics. The Current column represents count of Gy sessions that exist at the moment. The Max column represents maximal count of Gy sessions that ever existed at the same time. The Total column represents total count of Gy that existed or messages that were sent or received since the start or the last statistics reset. The Retries column represents total count of retransmitted Gy messages. The Errors column represents total count of received Gy messages that were invalid or outgoing Gy messages that could not be sent. The statistics details are described below:

**Gy sessions**  
Specifies the number of all Gy sessions established.

**Provisioned Gy sessions**  
Specifies the number of provisioned Gy sessions.

**Provisioning pending Gy sessions**  
Specifies the number sessions for which provisioning or creation over Gy has been initiated.

**Not provisioned Gy sessions**  
Specifies the number of not provisioned Gy sessions, i.e. provisioning pending and provisioning failed Gy sessions.

**Provisioning failed Gy sessions**  
Specifies the number of inactive Gy sessions for which provisioning or creation error happened.

**Termination pending Gy sessions**  
Specifies the number of Gy sessions for which close is initiated.

**Terminated Gy sessions**  
Specifies the total number of Gy sessions terminated since the last reset of the counter.

**CCR Sent**  
Specifies the number of Credit-Control-Request (CCR) requests of all types sent.

**CCR Initial Sent**  
Specifies the number of Credit-Control-Request (CCR) Initial requests sent since the last reset of the counter.

**CCR Update Sent**  
Specifies the number of Credit-Control-Request (CCR) Update requests sent since the last reset of the counter.

**CCR Termination Sent**  
Specifies the number of Credit-Control-Request (CCR) Termination requests sent since the last reset of the counter.

**CCA Received**  
Specifies the number of Credit-Control-Answer (CCA) responses of all types received.

**CCA Initial Received**  
Specifies the number of Credit-Control-Answer (CCA) Initial responses received since the last reset of the counter.

**CCA Update Received**  
Specifies the number of Credit-Control-Answer (CCA) Update responses received since the last reset of the counter.

**CCA Termination Received**  
Specifies the number of Credit-Control-Answer (CCA) Termination responses received since the last reset of the counter.

RAR Received  
Specifies the number of Re-Auth-Request (RAR) requests received.

RAA Sent  
Specifies the number of Re-Auth-Answer (RAA) responses sent.

You can reset the PEM gy statistics using reset-stats command.

#### EXAMPLES

show gy

Displays the PEM gy statistics.

reset-stats gy

Resets the PEM gy statistics.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, pem stats action, pem stats gx, pem stats hsl, pem stats radius, pem stats subscriber, tmsh

## pem stats hsl

NAME  
hsl - Displays and resets PEM hsl statistics.

MODULE  
pem stats

SYNTAX  
Display statistics for the hsl component within the pem stats module using the syntax in the following section.

DISPLAY  
show hsl  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

DESCRIPTION  
You can use the hsl component to display PEM hsl statistics. The statistics details are described below:

**Session Records**  
Specifies the number of Session-based records sent to each HSL endpoint since the last reset of the counter.

**Flow Start Records**  
Specifies the number of Flow Start records sent to each HSL endpoint since the last reset of the counter.

**Flow Interim Records**  
Specifies the number of Flow Interim records sent to each HSL endpoint since the last reset of the counter.

**Flow Stop Records**  
Specifies the number of Flow Stop records sent to each HSL endpoint since the last reset of the counter.

**Transaction Records**  
Specifies the number of HTTP Transaction records sent to each HSL endpoint since the last reset of the counter.

**Records Skipped**  
Specifies the number of reporting records skipped from being sent the HSL endpoint since the last reset of the counter.

**Media Quality-of-Experience (QoE) Records**  
When Media Quality-of-Experience (QoE) reporting is configured, specifies the number of QoE Records records sent to each HSL endpoint since the last reset of the counter.

**Media Quality-of-Experience (QoE) Records Skipped**  
When Media Quality-of-Experience (QoE) reporting is configured, specifies the number of QoE reporting records skipped (not real media) from being sent the HSL endpoint since the last reset of the counter.

You can reset the PEM hsl statistics using reset-stats command.

#### EXAMPLES

```
show hsl
```

Displays the PEM hsl statistics.

```
reset-stats hsl
```

Resets the PEM hsl statistics.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, pem stats action, pem stats gx, pem stats gy, pem stats radius, pem stats subscriber, tmsh

## pem stats hudnode-opt

#### NAME

hudnode-opt - Resets PEM hudnode-opt statistics.

#### MODULE

pem stats

#### SYNTAX

Reset statistics for the hudnode-opt component within the pem stats module using the syntax in the following section.

#### DESCRIPTION

You can use the hudnode-opt component to reset PEM hudnode-opt statistics.

#### EXAMPLES

```
reset-stats hudnode-opt
```

Resets the PEM hudnode-opt statistics.

#### OPTIONS

For information about the options that you can use with the command reset-stats, see help reset-stats.

#### SEE ALSO

reset-stats, pem stats action, tmsh, pem stats gx

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## pem stats multiple-ip

#### NAME

multiple-ip - Displays and resets PEM multiple IP statistics.

#### MODULE

pem stats

**SYNTAX**  
Display statistics for the multiple-ip component within the pem stats module using the syntax in the following section.

**DISPLAY**  
show multiple-ip  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the multiple-ip component to display PEM multiple IP statistics. The Total column represents total count of packets received. The Processed column represents total count of packets processed, i.e. packets that were successfully parsed, validated and initiated session creation, deletion or update. The Processed column is incremented regardless of success or failure of session creation, deletion or update and is incremented for retransmitted packets. The Retransmitted column represents total count of packets that were discarded, because they were retransmissions of already processed packets. The Error column represents total count of packets that could not be parsed or validated. The statistics details are described below:

**Forwarded Flows**  
Specifies the number of flows that have been forwarded.

**Sessions Merged**  
Specifies the number of sessions have been merged due to multiple IP.

You can reset the PEM multiple IP statistics using reset-stats command.

**EXAMPLES**  
show multiple-ip  
Displays the PEM multiple IP statistics.  
reset-stats multiple-ip  
Resets the PEM multiple IP statistics.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, pem stats action, pem stats gx, pem stats gy, pem stats hsl, pem stats subscriber, tmsh

**COPYRIGHT**

## **pem stats persistence**

**NAME**  
persistence - Displays and resets PEM persistence statistics.

**MODULE**  
pem stats

**SYNTAX**  
Display statistics for the persistence component within the pem stats module using the syntax in the following section.

**DISPLAY**  
show persistence  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the persistence component to display PEM persistence statistics. The statistics details are described below:

**Source IP**  
Number of times CARP persistence is based on source IP address.

**Destination IP**  
Number of times CARP persistence is based on destination IP address.

**HASH URI**  
Number of times CARP persistence is based on URI of the HTTP transaction.

HASH TCL  
Number of times CARP persistence is based on TCL script.

Fallback Source IP  
Number of times CARP persistence is based on fallback source IP address.

Fallback Destination IP  
Number of times CARP persistence is based on fallback destination IP address.

You can reset the PEM persistence statistics using reset-stats command.

#### EXAMPLES

show persistence

Displays the PEM persistence statistics.

reset-stats persistence

Resets the PEM persistence statistics.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, pem stats action, pem stats gx, pem stats gy, pem stats radius, pem stats subscriber, pem stats hsl, pem stats dtos, pem stats tethering, tmsb

## pem stats radius

NAME  
radius - Displays and resets PEM radius statistics.

MODULE  
pem stats

SYNTAX  
Display statistics for the radius component within the pem stats module using the syntax in the following section.

DISPLAY  
show radius  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

DESCRIPTION  
You can use the radius component to display PEM radius statistics. The Total column represents total count of packets received. The Processed column represents total count of packets processed, i.e. packets that were successfully parsed, validated and initiated session creation, deletion or update. The Processed column is incremented regardless of success or failure of session creation, deletion or update and is incremented for retransmitted packets. The Retransmitted column represents total count of packets that were discarded, because they were retransmissions of already processed packets. The Error column represents total count of packets that could not be parsed or validated. The statistics details are described below:

Accounting-Request START  
Specifies the number of Accounting-Start packets.

Accounting-Request STOP  
Specifies the number of Accounting-Stop packets.

Accounting-Request INTERIM\_UPDATE  
Specifies the number of Accounting-Interim packets.

Accounting-Request ACCOUNTING\_ON  
Specifies the number of Accounting-On packets.

Accounting-Request ACCOUNTING\_OFF  
Specifies the number of Accounting-Off packets.

You can reset the PEM radius statistics using reset-stats command.

#### EXAMPLES

show radius

Displays the PEM radius statistics.

reset-stats radius

Resets the PEM radius statistics.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, pem stats action, pem stats gx, pem stats gy, pem stats hsl, pem stats subscriber, tmsh

#### COPYRIGHT

## pem stats sd

#### NAME

sd - Displays and resets PEM sd statistics.

#### MODULE

pem stats

#### SYNTAX

Display statistics for the sd component within the pem stats module using the syntax in the following section.

#### DISPLAY

show sd

option:

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

#### DESCRIPTION

You can use the sd component to display PEM sd statistics. The Current column represents count of Sd sessions that exist at the moment. The Max column represents maximal count of Sd sessions that ever existed at the same time. The Total column represents total count of Sd sessions that existed or messages that were sent or received since the start or the last statistics reset. The Retries column represents total count of retransmitted Sd messages. The Errors column represents total count of received Sd messages that were invalid or outgoing Sd messages that could not be sent. The statistics details are described below:

##### Sd sessions

Specifies the number of all Sd sessions established.

##### Provisioned Sd sessions

Specifies the number of provisioned Sd sessions.

##### Provisioning pending Sd sessions

Specifies the number sessions for which provisioning or creation over Sd has been initiated.

##### Not provisioned Sd sessions

Specifies the number of not provisioned Sd sessions, i.e. all existing Sd sessions that have not been provisioned.

##### Provisioning failed Sd sessions

Specifies the number of inactive Sd sessions for which provisioning or creation error happened.

##### Termination pending Sd sessions

Specifies the number of Sd sessions for which close is initiated.

##### Terminated Sd sessions

Specifies the total number of Sd sessions terminated since the last reset of the counter.

##### CCR Sent

Specifies the number of Credit-Control-Request (CCR) requests of all types sent.

##### CCR Initial Sent

Specifies the number of Credit-Control-Request (CCR) Initial requests sent since the last reset of the counter.

##### CCR Update Sent

Specifies the number of Credit-Control-Request (CCR) Update requests sent since the last reset of the counter.

CCR Usage Monitoring Sent  
Specifies the number of Credit-Control-Request (CCR) requests with usage monitoring report sent.

CCR Application Start Sent  
Specifies the number of Credit-Control-Request (CCR) requests with application start report sent.

CCR Application Stop Sent  
Specifies the number of Credit-Control-Request (CCR) requests with application stop report sent.

CCR Termination Sent  
Specifies the number of Credit-Control-Request (CCR) Termination requests sent since the last reset of the counter.

CCA Received  
Specifies the number of Credit-Control-Answer (CCA) responses of all types received.

CCA Initial Received  
Specifies the number of Credit-Control-Answer (CCA) Initial responses received since the last reset of the counter.

CCA Update Received  
Specifies the number of Credit-Control-Answer (CCA) Update responses received since the last reset of the counter.

CCA Usage Monitoring Received  
Specifies the number of Credit-Control-Answer (CCA) responses with usage monitoring report ack received.

CCA Termination Received  
Specifies the number of Credit-Control-Answer (CCA) Termination responses received since the last reset of the counter.

RAR Received  
Specifies the number of Re-Auth-Request (RAR) requests received.

RAA Sent  
Specifies the number of Re-Auth-Answer (RAA) responses sent.

You can reset the PEM sd statistics using reset-stats command.

#### EXAMPLES

```
show sd
```

Displays the PEM sd statistics.

```
reset-stats sd
```

Resets the PEM sd statistics.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, pem stats action, pem stats gy, pem stats hsl, pem stats radius, pem stats subscriber, tmsh

#### COPYRIGHT

## pem stats subscriber

#### NAME

subscriber - Displays and resets PEM subscriber statistics.

#### MODULE

pem stats

#### SYNTAX

Display statistics for the subscriber component within the pem stats module using the syntax in the following section.

#### DISPLAY

```
show subscriber
```

#### option:

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

## DESCRIPTION

You can use the subscriber component to display PEM subscriber statistics. The Current column represents count of sessions or other objects that exist at the moment. The Max column represents maximal count of sessions or other objects that ever existed at the same time. The Total column represents total count of sessions or other objects that existed since the start or the last statistics reset. Some entries support only the Total column. The statistics details are described below:

### Active subscriber sessions

Specifies the number of all subscriber sessions. Note that you can use the db component in the sys module to configure `tmm.pem.spm.maxsessionlimit` to set the number of subscribers supported per processing unit (TMM). Then, the max number of the subscribers per device is set accordingly.

### Subscriber sessions marked for deletion

Specifies the number of sessions that were marked for deletion, but not yet deleted.

### Dynamic subscriber sessions without data from RADIUS

Specifies the number of sessions related to non-static subscribers that were neither created by RADIUS accounting start message nor updated by RADIUS accounting interim message. This counter is not incremented for a session related to static subscriber, even if this session is created dynamically.

### Subscriber sessions by state/Waiting for provisioning

Specifies the number of sessions that are pending for provision.

### Subscriber sessions by state/Waiting for provisioning Hold Timeout

Specifies the number of sessions that are within the provisioning hold time period.

### Subscriber sessions by state/Provisioned

Specifies the number of provisioned sessions.

### Subscriber sessions by state/Failed provisioning

Specifies the number of sessions, which provisioning failed. Usually this state is temporary and these sessions will try to be reprovisioned.

### Subscriber sessions by origin/Sessions discovered via RADIUS

Specifies the number of sessions, which were created by RADIUS accounting start message.

### Subscriber sessions by origin/Sessions discovered via DHCP

Specifies the number of sessions, which were created by DHCP message.

### Subscriber sessions by origin/Sessions discovered from traffic

Specifies the number of sessions, which were created by client traffic that doesn't correspond to any existing session.

### Subscriber sessions by origin/Sessions discovered via iRules

Specifies the number of sessions, which were created by iRules using `PEM::session create` or other command.

### Subscriber sessions by origin/Pre-configured Static Subscriber Sessions

Specifies the number of sessions, which were created for static subscriber with pre-configured IP-addresses.

### Subscriber sessions provisioning source/Sessions provisioned via Gx

Specifies the number of sessions, which were provisioned from PCRF via Gx interface.

### Subscriber sessions provisioning source/Sessions provisioned via Sd

Specifies the number of sessions, which were provisioned from PCRF via Sd interface.

### Subscriber sessions provisioning source/Sessions provisioned via iRules

Specifies the number of sessions, which were provisioned by iRule command.

### Subscriber sessions provisioning source/Sessions provisioned from static subscriber database

Specifies the number of sessions which policies were defined on creation of the corresponding static subscriber.

### Subscriber sessions provisioning source/Sessions not provisioned (pending and failed)

Specifies the number of not provisioned sessions.

### Subscriber session update statistics/Session updates received

Specifies total count of session update attempts, e.g. by RADIUS accounting interim message, Gx Credit-Control-Request (CCR) Update request or iRule command.

### Subscriber session update statistics/Session updates applied successfully

Specifies total count of session update attempts that were successful.

### Subscriber session update statistics/Session updates received via RADIUS

Specifies total count of session update attempts by RADIUS accounting interim message.

### Subscriber session update statistics/Session updates received via Gx

Specifies total count of session update attempts by Gx Credit-Control-Request updates (CCR-U) or Re-Auth-Requests updates (RAR).

### Subscriber session update statistics/Session updates received via Sd

Specifies total count of session update attempts by Sd Credit-Control-Request updates (CCR-U) or Re-Auth-Requests updates (RAR).

Subscriber session update statistics/Session updates received via iRules  
Specifies total count of session update attempts by iRule command.

Subscriber session deletion statistics/Total sessions fully deleted  
Specifies total count of completely deleted sessions.

Subscriber session deletion statistics/Sessions replaced  
Specifies total count of sessions that were deleted because they were replaced by other sessions.

Subscriber session deletion statistics/Provisioned sessions deleted  
Specifies total count of deleted sessions that had been provisioned at the moment of deletion.

Subscriber session deletion statistics/Waiting for provisioning sessions deleted  
Specifies total count of deleted sessions that were pending for provisioning at the moment of deletion.

Subscriber session deletion statistics/Failed provisioning sessions deleted  
Specifies total count of deleted sessions that were in provisioning failed state at the moment of deletion.

Subscriber session deletion statistics/Sessions deleted via RADIUS  
Specifies total count of sessions deleted by RADIUS accounting stop message.

Subscriber session deletion statistics/Sessions deleted via Gx  
Specifies total count of sessions deleted by Gx RAR-t message.

Subscriber session deletion statistics/Sessions deleted due to Gx connectivity problems  
Specifies total count of sessions deleted by the Fatal Grace Time timer associated with a diameter endpoint.

Subscriber session deletion statistics/Sessions deleted via Sd  
Specifies total count of sessions deleted by Sd RAR-t message.

Subscriber session deletion statistics/Sessions deleted due to Sd connectivity problems  
Specifies total count of sessions deleted by the Fatal Grace Time timer associated with a diameter endpoint.

Subscriber session deletion statistics/Sessions deleted via DHCP  
Specifies total count of sessions deleted by DHCP release message.

Subscriber session deletion statistics/Sessions deleted due to Inactivity  
Specifies total count of sessions deleted due to inactivity for time configured in the tmm.pem.session.inactivitytimeout variable.

Subscriber session deletion statistics/Sessions deleted via iRules  
Specifies total count of sessions deleted by iRule command.

Subscriber session deletion statistics/Sessions deleted administratively  
Specifies total count of sessions deleted interactively by operator.

Subscriber session deletion statistics/Sessions deleted due to static subscriber removal  
Specifies total count of sessions deleted due to deletion of the corresponding static subscriber. This includes sessions that were created by RADIUS accounting start message, but deleted by deletion of static subscriber.

Subscriber session deletion statistics/Pre-configured static subscriber sessions deleted  
Specifies total count of deleted sessions, which policies were defined on creation of the corresponding static subscriber. This includes sessions that were configured in static subscriber, but created and deleted by RADIUS accounting messages.

Multiple IP address subscriber sessions/Active sessions with single IP address  
Specifies the number of sessions, which are associated with one IP address.

Multiple IP address subscriber sessions/Active sessions with multiple IP addresses  
Specifies the number of sessions, which are associated with more than one IP address.

Multiple IP address subscriber sessions/Active sessions with both IPv4 and IPv6 addresses  
Specifies the number of sessions, which are associated with one or multiple IPv4 addresses and one or multiple IPv6 addresses

Multiple IP address subscriber sessions/Active sessions with more than one IPv4 address  
Specifies the number of sessions, which are associated with more than one IPv4 address.

Multiple IP address subscriber sessions/Active sessions with more than one IPv6 address  
Specifies the number of sessions, which are associated with more than one IPv6 address.

Multiple IP address subscriber sessions/Total session IPv4 addresses

Specifies the number of IPv4 addresses associated with existing sessions. IP address uniqueness is not checked, so if the same IP address is added and removed several times, the total counter is incremented the each time address is added.

Multiple IP address subscriber sessions/Total session IPv6 addresses  
Specifies the number of IPv6 addresses associated with existing sessions. IP address uniqueness is not checked, so if the same IP address is added and removed several times, the total counter is incremented the each time address is added.

Multiple IP address subscriber sessions/Sessions provisioned after hold timeout  
Specifies the number of sessions, which were put on provision hold and were provisioned after the provision hold period finished.

Multiple IP address subscriber sessions/Session IP addresses added after session is provisioned  
Specifies the total number of IP addresses that were added to already provisioned sessions. IP address uniqueness is not checked, so if the same IP address is added and removed several times, this counter is incremented the each time address is added.

Multiple IP address subscriber sessions/Session IP addresses removed without session delete  
Specifies the total number of IP addresses that were removed from existing sessions without session deletion. This is possible for sessions associated with multiple IP addresses.

Exceptions, Errors, Other Statistics/Failed provisioning attempts  
Specifies the aggregated number of failed provisioning attempts for all subscribers in the system since the last reset of the counter. For example, a provisioning attempt fails if a policy server (PCRF) returns an error, or does not respond for any reason.

Exceptions, Errors, Other Statistics/Subscriber Limit Exceeded  
Specifies the count of the session creation failures, which are caused by exceeding the max number of subscribers supported by one processing unit (TMM).

Exceptions, Errors, Other Statistics/Session IP address limit exceeded  
Specifies the count of the session creation or update failures, which are caused by exceeding the max number of IP addresses per session.

Exceptions, Errors, Other Statistics/Attempts to remove non-existent session via RADIUS  
Specifies the count of attempts to remove session by RADIUS accounting stop message, which failed because the session was not found.

Exceptions, Errors, Other Statistics/Attempts to remove non-existent session via DHCP  
Specifies the count of attempts to remove session by DHCP release message, which failed because the session was not found.

Exceptions, Errors, Other Statistics/Attempts to remove non-existent session via Gx  
Specifies the count of attempts to remove session by Gx RAR-t message, which failed because the session was not found.

Exceptions, Errors, Other Statistics/Attempts to remove non-existent session via Sd  
Specifies the count of attempts to remove session by Sd RAR-t message, which failed because the session was not found.

Exceptions, Errors, Other Statistics/Attempts to remove non-existent session via iRules  
Specifies the count of attempts to remove session by iRule command, which failed because the session was not found.

Exceptions, Errors, Other Statistics/Subscriber sessions with activity log enabled  
Specifies the number of sessions for which the activity log was enabled.

You can reset the PEM subscriber statistics using reset-stats command.

#### EXAMPLES

```
show subscriber
```

Displays the PEM subscriber statistics.

```
reset-stats subscriber
```

Resets the PEM subscriber statistics.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, pem stats action, pem stats gx, pem stats gy, pem stats hsl, pem stats radius, tmsh

## **pem stats tethering**

**NAME**  
tethering - Displays and resets PEM tethering statistics.

**MODULE**  
pem stats

**SYNTAX**  
Display statistics for the tethering component within the pem stats module using the syntax in the following section.

**DISPLAY**  
show tethering  
option:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the tethering component to display PEM tethering statistics. The statistics details are described below:

**Subscribers Monitored**  
Specifies the number of subscribers being monitored for tethering since the last reset of the counter.

**Subscribers Tethering**  
Specifies the number of subscribers tethering since the last reset of the counter.

**Subscribers Tethering Maximum**  
Specifies the maximum number of subscribers that were found to be tethering at any point since the last reset of the counter.

You can reset the PEM tethering statistics using reset-stats command.

**EXAMPLES**  
show tethering  
Displays the PEM tethering statistics.  
reset-stats tethering  
Resets the PEM tethering statistics.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, pem stats action, pem stats gx, pem stats gy, pem stats radius, pem stats subscriber, pem stats hsl, tmsh

**COPYRIGHT**

F5 Networks and BIG-IP (c) Copyright 2009-2014. All rights reserved.

## **pem subscriber-attribute**

**NAME**  
subscriber-attribute - Configures subscriber attributes in Policy Enforcement Manager (PEM).

**MODULE**  
pem

**SYNTAX**  
Configure the subscriber-attribute component within the pem module

using the syntax shown in the following sections.

```
CREATE/EDIT/MODIFY
create subscriber-attribute [name]
modify subscriber-attribute [name]
options:
  app-service [[string] | none]
  description [string]
  export [disabled | enabled]
  import [disabled | enabled]
  well-known-attr-id [called-station-id | calling-station-id | imeisv | imsi | ipaddr | not-defined | subs-id | user
```

```
edit subscriber-attribute [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list subscriber-attribute
list subscriber-attribute [ [ [name] | [glob] | [regex] ] ... ]
show running-config subscriber-attribute
show running-config subscriber-attribute [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
```

```
DELETE
delete subscriber-attribute [name]
```

Note: You must remove all references to a subscriber-attribute before you can delete the subscriber-attribute.

#### DESCRIPTION

You can use the subscriber-attribute component to configure subscriber attribute definitions in Policy Enforcement Manager.

#### EXAMPLES

```
create subscriber-attribute 3gpp_imsi { import enabled export enabled
well-known-attr-id imsi}
```

Creates a PEM subscriber attribute 3gpp\_imsi with import enabled, export enabled, and well-known attribute id 'imsi'.

```
delete subscriber-attribute 3gpp_imsi
```

Deletes the PEM subscriber attribute named 3gpp\_imsi.

```
list subscriber-attribute 3gpp_imsi
```

Displays the properties of the PEM subscriber attribute named 3gpp\_imsi.

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**description**  
User defined description.

**export**  
Specifies whether the subscriber attribute can be exported (inserted) to the outgoing messages defined in pem protocol profile. This configuration is not applicable when referenced in pem protocol profile radius. It is applicable when referenced in pem protocol profile gx. The default value is enabled.

**import**  
Specifies whether the subscriber attribute can be imported (parsed) from the incoming messages defined pem protocol profile. The default value is enabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**  
Displays the name of the administrative partition within which the subscriber attribute resides.

**well-known-attr-id**  
Specifies an identifier of a well-known (build-in) subscriber attribute. The system provides a special handling for well-known subscriber attributes. For instance, most of the well-known attributes are included into session reporting records by default.

The options are:

**called-station-id**  
The well-known subscriber attribute ID is called-station-id.

**calling-station-id**  
The well-known subscriber attribute ID is calling-station-id.

**imeisv**  
The well-known subscriber attribute ID is imeisv.

**imsi** The well-known subscriber attribute ID is imsi.

**ipaddr**

The well-known subscriber attribute ID is ipaddr. It can be ipv4 or ipv6 address.

not-defined  
The well-known subscriber attribute ID is not defined. This is the default value.

subs-id  
The well-known subscriber attribute ID is subs-id.

user-location-info  
The well-known subscriber attribute ID is user-location-info.

username  
The well-known subscriber attribute ID is username.

#### SEE ALSO

---

## pem subscriber

**NAME**  
subscriber - Configures subscribers for the Policy Enforcement Manager (PEM).

**MODULE**  
pem

**SYNTAX**  
Modify static subscriber component within PEM module using the syntax shown in the following sections.

```
CREATE/MODIFY
create subscriber [name]
modify subscriber [name]
options:
  app-service [[string] | none]
  ip-address-list [add | delete | replace-all-with] {
    [ip address ...]
  }
  policies [add | delete | replace-all-with] {
    [policy_name ...]
  }
  policies [default | none]
  subscriber-id-type [dhcp | dhcp-custom | e164 | imsi | mac-address | mac-dhcp | nai | private ]

edit subscriber [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties

DISPLAY
list subscriber
list subscriber [ [name] | [glob] | [regex] ] ... ]
show running-config subscriber
show running-config subscriber [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition

DELETE
delete subscriber [name]
```

Note: You must remove all references to a subscriber before you can delete the subscriber.

#### DESCRIPTION

You can use the subscriber component to configure subscriber definitions for the Policy Enforcement Manager. Subscriber session IP addresses may optionally include a route domain ID. When specified, the route domain ID follows the IP address, after '%' separator. For example, 10.10.10.100%5 is an IP address in route domain 5. A subscriber session may have multiple IP addresses in different route domains.

## EXAMPLES

```
create subscriber 4085551212 { ip-address-list add { 10.10.10.2
10.10.10.3 } policies add { policy1 } subscriber-id-type imsi }
```

Creates a PEM subscriber 4085551212 with IP addresses 10.10.10.2 and 10.10.10.3, subscriber id type imsi, and a policy policy1.

```
create subscriber 4085551212 { ip-address-list add { 10.10.10.2%5
10.10.10.3%77 } policies add { policy1 } subscriber-id-type imsi }
```

Creates a PEM subscriber 4085551212 with IP addresses 10.10.10.2 and 10.10.10.3 in route domains 5 and 77 respectively, subscriber id type imsi, and a policy policy1.

```
create subscriber 4085551212 { ip-address-list add { 10.10.10.2%5
10.10.10.2%77 } policies add { policy1 } subscriber-id-type imsi }
```

Creates a PEM subscriber 4085551212 with two IP address entries that consist of the same IP address 10.10.10.2 and different route domain IDs: 5 and 77, subscriber id type imsi, and a policy policy1.

```
delete subscriber subl
```

Deletes the subscriber named subl.

```
list subscriber subl
```

Displays the properties of the subscriber named subl.

## OPTIONS

### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**name** Specifies a unique subscriber identifier (up to 64 characters). This option is required for the commands create, delete, and modify.

### ip-address-list

Adds, deletes, or replaces a list of the ip address to associate with the subscriber.

### policies

Adds, deletes, or replaces a set of the policies to associate with the subscriber.

### subscriber-id-type

Specifies the format to use for the subscriber id. The default value is imsi.

The options are:

**dhcp** For subscribers discovered via DHCP: an identifier comprises either Relay Option (option 82) for DHCPv4 based subscriber IDs or REMOTE-ID and SUBSCRIBER-ID Options (options 37 and 38) for DHCPv6, as configured in the corresponding DHCP profile.

### dhcp-custom

For subscribers discovered via DHCP: an identifier created using a custom TCL snippet.

**e164** A numbering plan that defines the format of an MSISDN international phone number (up to 15 digits). The number typically consists of three fields: country code, national destination code, and subscriber number.

**imsi** International Mobile Subscriber Identity. A globally unique code number that identifies a GSM, UMTS, or LTE mobile phone user.

### mac-address

For subscribers discovered via DHCP: subscriber MAC address in a standard IEEE 802 format for MAC-48 (six groups of two hexadecimal digits, separated by colons ':').

### mac-dhcp

For subscribers discovered via DHCP: a concatenation of mac-address and dhcp identifier as configured in the corresponding DHCP profile.

**nai** Network Access Identifier. A fully qualified network name in the form @; identifies a subscriber and the home network to which the subscriber belongs.

### private

The subscriber id type is private for the given deployment.

## pem subscribers

**NAME**  
subscribers - Loads static subscribers for the Policy Enforcement Manager (PEM) from a file.

**MODULE**  
pem

**SYNTAX**  
Loads static subscribers from a file within the pem module using the syntax shown in the following sections.

**LOAD**  
load subscribers file [filename]

**DESCRIPTION**  
You can use the command load pem subscribers to load static subscribers definitions for the Policy Enforcement Manager (PEM). The maximum number of static subscribers allowed is (2 \* sys db variable tmm.pem.spm.maxsessionlimit) or 100000, whichever is the lesser.

The static subscribers file is a csv file with the following fields: ,[,]\*[,]+. Each record can have zero IP address but must have at least one policy.

The maximum number of IP addresses per subscriber is set by sys db variable tmm.pem.session.ip.addr.max.

The maximum number of IPv4 addresses per subscriber is set by sys db variable tmm.pem.session.ipv4.addr.max.

The maximum number of IPv6 addresses per subscriber is set by sys db variable tmm.pem.session.ipv6.addr.max.

For example, these are the examples from such file:

```
subscriber1,e164,2,11.1.1.1,11.1.1.2,bronze,gold,silver
subscriber2,imsi,0,gold
```

The filename either absolute file name or just the base file name under folder: /var/local/pem/subscribers/

For more information about static subscriber, please refer to pem subscriber module.

**EXAMPLES**  
load subscribers file my\_ss\_file

Loads static subscribers from file "my\_ss\_file" under the folder: /var/local/pem/subscribers/.

```
load subscribers file /shared/tmp/new_ss_file
```

Loads static subscribers from file "new\_ss\_file" under the folder: /shared/tmp/.

**SEE ALSO**

## security analytics settings

**NAME**  
settings - Configure global settings for security (AFM) analytics.

**MODULE**  
security analytics

**SYNTAX**  
Configure the settings component within the security analytics module using the syntax shown in the following sections.

**MODIFY**  
modify settings  
options:  
acl-rules {  
  collect-client-ip [enabled | disabled]  
  collect-client-port [enabled | disabled]  
  collect-dest-ip [enabled | disabled]  
  collect-dest-port [enabled | disabled]  
  collect-server-side-stats [enabled | disabled]  
}  
collected-stats-internal-logging [enabled | disabled]  
collected-stats-external-logging [enabled | disabled]  
dns {  
  collect-client-ip [enabled | disabled]  
}  
dos-12-14 {  
  collect-client-ip [enabled | disabled]  
}  
13-14-errors {  
  collect-client-ip [enabled | disabled]  
  collect-dest-ip [enabled | disabled]  
}  
publisher [name]  
smtp-config [name]  
stale-rules {  
  collect [enabled | disabled]  
}

**DISPLAY**  
list settings

**DESCRIPTION**  
Use the settings component to modify the settings for analytics entity collection for the AFM (advanced firewall) module.

**EXAMPLES**  
modify settings acl-rules { collect-client-ip disabled }  
  
Disables source/client IP analytics collection for ACL rules.  
  
list settings  
  
Displays analytics settings for AFM.

**OPTIONS**  
acl-rules  
Firewall (ACL) security statistics collection options.  
  
collect-client-ip  
Specifies whether source/client IP address should be collected for ACL rule matching.  
  
collect-client-port  
Specifies whether source/client port should be collected for ACL rule matching.  
  
collect-dest-ip  
Specifies whether the destination IP address should be collected for ACL rule matching.  
  
collect-dest-port  
Specifies whether the destination port should be collected for ACL rule matching.  
  
collect-server-side-stats  
Specifies whether server side statistics (source address translation information, self IP address and pool member address) should be collected for ACL rule matching.  
  
collected-stats-internal-logging  
Enables or disables the internal logging of the collected statistics.  
  
collected-stats-external-logging  
Enables or disables the external logging of the collected statistics.  
  
dns DNS security statistics collection options.  
  
collect-client-ip  
Specifies whether source/client IP address should be collected for DNS security.  
  
dos-12-14  
Network DoS security statistics collection options.

`collect-client-ip`  
Specifies whether source/client IP address should be collected for network layer's DoS security.

`l3-l4-errors`  
Firewall errors statistics collection options.

`collect-client-ip`  
Specifies whether source/client IP address should be collected for firewall errors.

`collect-dest-ip`  
Specifies whether the destination IP address should be collected for firewall errors.

`publisher`  
Specifies the external logging publisher used to send statistical data to one or more destinations.

`smtp-config`  
Specifies the default SMTP configuration used for exporting CSV or PDF security analytics reports.

`stale-rules`  
`collect`  
Specifies whether statistics about all firewall rules should be collected in order to present information regarding rule staleness.

## security anti-fraud engine-update

**NAME**  
`engine-update` - Runs or loads an Anti-fraud engine update.

**MODULE**  
`security anti-fraud`

**SYNTAX**  
Run or load the `engine-update` component within the `security anti-fraud` module using the syntax in the following sections:

**LOAD**  
`load engine-update`  
options:  
file [filename]

If optional parameter `file filename` is specified in the load command, the command loads and installs engine update from local file instead of the cloud.

**RUN**  
`run engine-update`

**DISPLAY**  
`list engine-update`  
options:  
all-properties  
current-version-create-datetime  
download-available  
install-datetime  
install-user  
message  
non-default-properties  
one-line  
partition  
progress-status  
progress-status-datetime  
readme

**DESCRIPTION**  
You can use the `engine-update` component to run, load or display status of engine update.

**EXAMPLES**  
`list security anti-fraud engine-update`

Displays the status of engine update.

#### OPTIONS

`current-version-create-datetime`  
Displays the creation time of currently installed engine update version.

`download-available`  
Displays whether new engine version is available for download from the cloud.

`file` Specifies the file name from which the engine update is going to be installed when using the load command. A full path should be specified.

`install-datetime`  
Displays the time when engine update was installed.

`install-user`  
Displays the name of the user who installed the last engine update.

`message`  
Displays the message describing the failure status of engine update.

`partition`  
Displays the administrative partition within which this object resides.

`progress-status`  
Displays the engine update progress status.

`progress-status-datetime`  
Displays the time when engine update progress status was last changed.

`readme`  
Displays the Readme content for the current engine update.

```

### DELETE

```
delete profile [name]
```

### DESCRIPTION

You can use the profile component to create, modify, display, or delete an Anti-Fraud profile.

Note: The users property may be specified only for the commands modify, edit, and list and only when no other properties are specified. By default, users are not displayed.

Note: The first-login-time property of user modes may be specified only for the list command.

### EXAMPLES

```
create profile my_antifraud_profile
```

Creates a custom Anti-Fraud profile named my\_antifraud\_profile with default parameters.

```
list profile
```

Displays the properties of all Anti-Fraud profiles.

### OPTIONS

alert-client-side-caching

Specifies whether or not to cache the sent alerts in order to prevent multiple alerts from being sent to the dashboard.

alert-identifier

Specifies the ID of the customer in the dashboard.

alert-path

Specifies the BIG-IP URL path where the alert is sent. This path cannot be none and must start with '/'.

alert-pool

Specifies the name of the pool used when the system sends alerts.

alert-publisher

Specifies the name of the log publisher used for sending alerts originating from the BIG-IP.

alert-token-header

Specifies the name of the custom HTTP header in alerts for exchanging a random token between the client side and the BIG-IP.

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

auto-transactions

Specifies how the system differentiates between human and automatic (bot) transactions. You can configure the following options for automatic transactions:

bot-score

Deprecated since v13.0.0. Please use bot-score in auto-transactions under urls instead. Specifies the score added to an alert that is triggered if the system determines that the client is a bot and not a human. The default is a score of 50.

click-score

Deprecated since v13.0.0. Please use click-score in auto-transactions under urls instead. Specifies the score added to an alert that is triggered if the min-mouse-over-count and min-mouse-move-count conditions are not met. The default is a score of 40.

integrity-fail-score

Deprecated since v13.0.0. Please use integrity-fail-score in auto-transactions under urls instead. Specifies the score added to an alert that is triggered if the system detects a difference between the actual parameter value and the expected value of a protected parameter sent after a user clicks a web form's Submit button. The default is a score of 40.

min-mouse-move-count

Deprecated since v13.0.0. Please use min-mouse-move-count in auto-transactions under urls instead. Specifies the minimum number of mouse movements necessary per page load in order for the system to consider the transaction to be of human origin. The default is 5 movements.

min-mouse-over-count

Deprecated since v13.0.0. Please use `min-mouse-over-count` in `auto-transactions` under `urls` instead. Specifies the minimum number of times the client's mouse is positioned over the Submit button in a web form in order for the system to consider the transaction to be of human origin. The default is 2 button interactions.

#### `min-report-score`

Deprecated since v13.0.0. Please use `min-report-score` in `auto-transactions` under `urls` instead. Specifies the lowest score necessary for the system to send an alert. The default value is 50.

#### `min-time-to-request`

Deprecated since v13.0.0. Please use `min-time-to-request` in `auto-transactions` under `urls` instead. Specifies the minimum amount of time (in seconds) permitted between when a web form is opened and the Submit button is clicked. The default is 2 seconds.

#### `not-human-score`

Deprecated since v13.0.0. Please use `not-human-score` in `auto-transactions` under `urls` instead. Specifies the score added to an alert that is triggered if the system only suspects that the client is a bot and not a human. The default is a score of 25.

#### `strong-integrity`

Specifies how the system performs strong integrity. You can configure the following options for strong integrity:

#### `hide-encrypted-parameters`

Specifies, when enabled, that JavaScript does not add the expected value of encrypted parameters to strong integrity parameter.

#### `parameter`

Specifies the name of the HTTP parameter in POST requests added by JavaScript with the expected user-input data verified with physical input events.

#### `tampered-cookie-score`

Deprecated since v13.0.0. Please use `tampered-cookie-score` in `auto-transactions` under `urls` instead. Specifies the score added to an alert that is triggered if the system detects that the transaction-data cookie was tampered with. The default is a score of 50.

#### `time-fail-score`

Deprecated since v13.0.0. Please use `time-fail-score` in `auto-transactions` under `urls` instead. Specifies the score added to an alert that is triggered if the `min-time-to-request` condition is not met. The default is a score of 20.

#### `before-load-function`

Specifies the implementation of additional function to be run before JavaScript load, in the following format: `function(configs){...}`. Note: For certain advanced configurations, F5 support may provide a relevant code to be entered here, please do not use it on your own.

#### `blocking-page`

Specifies information to display when the profile blocks a user account. You can configure the following options for blocking page:

#### `response-body`

Specifies the HTML code the system sends to the user whose account is blocked.

#### `response-headers`

Specifies the set of response headers that the system sends to the user whose account is blocked. Separate each header with a new line (Ctrl-V followed by Ctrl-J).

#### `[case-sensitive | case-insensitive]`

Specifies whether the profile treats protected URL paths as case sensitive, or not. The default value is case-insensitive. Note: If you create a profile, you can use either property, thereafter it becomes read only. If the profile is case insensitive, the system stores protected URL paths in lowercase in the profile configuration.

#### `cloud-service-pool`

Specifies the name of the pool used by the system for various internal purposes, like signing Forensics tool.

#### `config-location`

Specifies the BIG-IP URL directory where the configuration for the injected JavaScript is located. The path here does not include the actual filename of the configuration for the injected JavaScript. This path cannot be none and must start with `'/'`.

#### `cookies`

Specifies names and lifetimes for the cookies that the system uses to optimize its detection of malware, data transactions, and phishing attacks on the web application. If you do not assign a name to a cookie, a random name is assigned. You can configure the following cookies:

#### `application`

Adds, deletes, or replaces a set of application cookies that will be removed if at least one of the protected cookies is missing.

#### base-domain

Specifies base domain settings for the cookies. You can configure the following options for base domain:

#### apply

Specifies, when enabled, that the system applies the cookies to the base domain.

#### exceptions

Adds, deletes, or replaces a set of exceptional base domains that take precedence when the system resolves the base domain from a host header.

#### client-side

Specifies the name of the cookie in which the system inserts plain text with a record about client side alerts already sent. This is done in order to prevent flooding the system with additional alerts if the page reloads.

#### client-side-lifetime

Specifies whether the client-side cookie is persistent, and if so, after how many minutes it expires.

#### components-state

Specifies the name of the cookie that verifies that the system's expected JavaScript can run successfully, and whether the system successfully decrypted configuration data arriving from server.

#### components-state-lifetime

Specifies whether the components-state cookie is persistent, and if so, after how many minutes it expires.

#### components-state-removal-protection

Enables or disables protection of the secure-alert cookie from removal.

#### encryption-disabled

Specifies the name of the cookie that the system adds if the system fails to decrypt a password (to restore the original password as the user typed it), and the system forwards a request to the server and waits for a login failure response. In this case, the cookie does not encrypt the password on the next login attempt. This is used in situations where Application layer encryption is not possible (for example, if the user is using an old browser that cannot encrypt passwords).

#### encryption-disabled-lifetime

Specifies whether the encryption-disabled cookie is persistent, and if so, after how many minutes it expires.

#### encryption-disabled-removal-protection

Enables or disables protection of the encryption-disabled cookie from removal.

#### fingerprint

Specifies the name of the cookie that contains fingerprint data.

#### fingerprint-lifetime

Specifies whether the fingerprint cookie is persistent, and if so, after how many minutes it expires.

#### fingerprint-removal-protection

Enables or disables protection of the fingerprint cookie from removal.

#### html-field-obfuscation

Specifies the name of the cookie that the system sets to identify the fields that were created by HTML field obfuscation, in order to remove them from the request before sending it back to the web application, and to know which field names to decrypt.

#### html-field-obfuscation-lifetime

Specifies whether the html-field-obfuscation cookie is persistent, and if so, after how many minutes it expires.

#### malware-forensic

Specifies the name of the cookie that stores the essential response header values from the web application to be sent to the user after he finishes or skips downloading and running Forensics tool on his host.

#### malware-forensic-lifetime

Specifies whether the malware-forensic cookie is persistent, and if so, after how many minutes it expires.

#### malware-guid

Specifies the name of the cookie set by JavaScript to a random string (12 chars long, not encrypted). The system sends this cookie value in a special alert to the dashboard in order to associate it with the logged in user.

#### malware-guid-lifetime

Specifies whether the malware-guid cookie is persistent, and if so, after how many minutes it expires.

#### malware-guid-removal-protection

Enables or disables protection of the malware-guid cookie from removal.

**rules**  
Specifies the name of the cookie that the system sets in order to perform the actions route and/or redirect.

**rules-lifetime**  
Specifies whether the rules cookie is persistent, and if so, after how many minutes it expires.

**rules-removal-protection**  
Enables or disables protection of the rules cookie from removal.

**secure-alert**  
Specifies the name of the cookie that secures arrival of alerts originating from JavaScript to the dashboard.

**secure-alert-lifetime**  
Specifies whether the secure-alert cookie is persistent, and if so, after how many minutes it expires.

**secure-alert-removal-protection**  
Enables or disables protection of the secure-alert cookie from removal.

**secure-channel**  
Specifies the name of the cookie that the system sets when the system provides JavaScript with a public key for encryption operations. This cookie is used for the system to correlate incoming encrypted data with the private key when a request comes from the client.

**secure-channel-lifetime**  
Specifies whether the secure-channel cookie is persistent, and if so, after how many minutes it expires.

**secure-channel-removal-protection**  
Enables or disables protection of the secure-channel cookie from removal.

**transaction-data**  
Specifies the name of the cookie that contains information (such as mouse movement, clicks, and events) in encrypted format and sends that information to the system.

**transaction-data-lifetime**  
Specifies whether the transaction-data cookie is persistent, and if so, after how many minutes it expires.

**user-inspection**  
Specifies the name of cookie that is set once a user is identified in a web form submitted by the client and this user is enforced in inspection mode.

**user-name**  
Specifies the name of the cookie with the username value after a username is identified in a request. This ensures that further transactions from the client are still associated with that user even if they do not include the username field.

**user-name-lifetime**  
Specifies whether the user-name cookie is persistent, and if so, after how many minutes it expires.

**user-name-removal-protection**  
Enables or disables protection of the user-name cookie from removal.

**debug**  
Specifies troubleshooting settings to add and filter debug logs of the system. Note: Only F5 support should configure this section, please do not use it on your own. F5 support can configure the following debug options:

**console-log**  
Specifies when the system add prints to browser console. TMM logs are also enabled in such cases. F5 support can configure the following options for console log:

**client-ips**  
Adds, deletes, or replaces a set of client IP addresses for which the system adds prints to browser console.

**user-agents**  
Adds, deletes, or replaces a set of strings contained in user-agent header for which the system adds prints to browser console.

**fingerprints**  
Adds, deletes, or replaces a set of strings contained in fingerprint data for which the system adds prints to browser console.

**send-alert**  
Specifies when the system sends debug alerts to the dashboard. TMM logs are also enabled in such cases. F5 support can configure the following options for sending alerts:

**client-ips**  
Adds, deletes, or replaces a set of client IP addresses for which the system sends debug alerts to the dashboard.

#### user-agents

Adds, deletes, or replaces a set of strings contained in user-agent header for which the system sends debug alerts to the dashboard.

#### fingerprints

Adds, deletes, or replaces a set of strings contained in fingerprint data for which the system sends debug alerts to the dashboard.

#### defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified.

#### description

User defined description.

#### encryption-staging-mode

Specifies, when enabled, that the system activates Anti-fraud encryption staging mode. If decrypted data differs from original data, an alert will be sent and original data will be used.

#### fingerprint

Specifies how the system collects fingerprint data. You can configure the following fingerprint options:

#### collect

Specifies, when enabled, that the system collects fingerprint data.

#### location

Specifies the BIG-IP URL location of the fingerprint JavaScript. This path cannot be none and must start with '/'.

#### forensic

Specifies how the system enforces scanning client host for malware (Forensics) and its removal (remediation). You can configure the following options for Forensics and remediation:

#### alert-path

Specifies the BIG-IP URL path for alerts from Forensics tool. This path cannot be none and must start with '/'.

#### client-domains

Adds, deletes, or replaces a set of client domains to be resolved by Forensics tool.

#### cloud-config-path

Specifies the BIG-IP URL path for requests from Forensics tool to cloud-service-pool. This path cannot be none and must start with '/'.

#### cloud-forensics-mode

Specifies the numeric value sent to cloud-service-pool to download Forensics tool.

#### cloud-remediation-mode

Specifies the numeric value sent to cloud-service-pool to download Forensics tool in remediation mode.

#### continue-element

Specifies the HTML element with continue option that replaces %SKIP\_PART% in the entire html, when enforce-policy is enforce. Note: This property may be modified only when the DB variable antifraud.forensic.showgui has value enable.

#### exe-location

Specifies the BIG-IP URL path to download Forensics tool that also replaces %EXE\_LOCATION% in the entire html. This path cannot be none and must start with '/'.

html Specifies the HTML code the system sends to the user after successful login with option to download Forensics tool. Note: This property may be modified only when the DB variable antifraud.forensic.showgui has value enable.

#### self-post-location

Specifies the BIG-IP URL path for self POST page opened by Forensics tool during scanning. This path cannot be none and must start with '/'.

#### skip-element

Specifies the HTML element with skip option that replaces %SKIP\_PART% in the entire html, when enforce-policy is not enforce. Note: This property may be modified only when the DB variable antifraud.forensic.showgui has value enable.

#### skip-path

Specifies the BIG-IP URL path for skip / continue option that also replaces %SKIP\_PATH% in both continue-element and skip-element (before their replacement in the entire html). This path cannot be none and must start with '/'.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### javascript-location

Specifies the BIG-IP URL directory where the injected JavaScript is located. The path here does not include the actual filename of the injected JavaScript. This path cannot be none and must start with '/'.

#### inject-main-javascript

Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies where the system injects the main JavaScript. You can configure the following options for main JavaScript injection position:

[after | before]

Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies whether the system injects the main JavaScript after an opening tag or before a closing tag.

tag Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies the HTML tag for injection of the main JavaScript. This tag cannot be none.

malware

Specifies how the system detects a malware attack on the web application. You can configure the following options for Malware protection:

allowed-domains

Adds, deletes, or replaces a set of whitelisted domains. The system does not send alerts on requests for URLs from these domains, even if the system detects malware injection on these domains.

bait-check-generic

Specifies, when enabled, that the system checks predefined baits. Note: The configured baits are checked anyway.

bait-location

Specifies the BIG-IP URL location of a file that acts as bait for attackers. This path cannot be none and must start with '/'.

blacklist-words

Deprecated since v13.0.0. Please use blacklist-js-words and blacklist-words in detected-malware instead. Adds, deletes, or replaces a set of words that are blacklisted if they appear in the web application's HTML or JavaScript code. If the system detects these words, the system generates a malware alert.

detected-malware

Adds, deletes, or replaces a set of malware detected by the system. You can configure the following options for each malware:

baits

Adds, deletes, or replaces a set of baits for this malware. You can configure the following options for each bait:

data-before

Specifies the HTML code that the malware searches and injects data-inject after it.

data-inject

Specifies the malicious code that the malware injects after data-before.

trigger-url

Specifies trigger URL settings for this bait. You can configure the following options for trigger URL:

name Specifies the URL pattern that triggers the malware to inject malicious code.

position

Specifies the position of this URL pattern in the query string of a bait request.

alone

Specifies that this trigger URL must be alone in the query string of a bait request.

any

Specifies that the this trigger URL can be anywhere in the query string of a bait request. This is the default value.

last

Specifies that the this trigger URL must be last in the query string of a bait request.

blacklist-functions

Adds, deletes, or replaces a set of regular expression patterns to detect functions that this malware can use when executing AJAX requests.

blacklist-js-words

Adds, deletes, or replaces a set of words that are blacklisted if they appear in the JavaScript code. If the system detects these words, the system generates a malware alert.

blacklist-urls

Adds, deletes, or replaces a set of regular expression patterns to detect URLs that this malware can use for AJAX requests and external scripts.

blacklist-words

Adds, deletes, or replaces a set of words that are blacklisted if they appear in the web application's HTML code. If the system detects these words, the system generates a malware alert.

#### browser-cache

Specifies how the system checks client network connection as targeted method. You can configure the following options for Browser cache:

##### blacklist-urls

Adds, deletes, or replaces a set of resources that are loaded by the malware.

##### whitelist-urls

Adds, deletes, or replaces a set of non-existent resources.

#### domain-availability

Specifies how the system checks client network connection as generic method. You can configure the following options for Domain availability:

##### blacklist-urls

Adds, deletes, or replaces a set of URLs that are not blocked by the malware.

##### whitelist-urls

Adds, deletes, or replaces a set of URLs that are blocked by the malware.

#### generic-whitelist-words

Adds, deletes, or replaces a set of generic blacklisted words that are ignored.

#### domain-availability-urls

Deprecated since v13.0.0. Please use blacklist-urls and whitelist-urls in domain-availability under detected-malware instead. Specifies a JSON object containing URLs for which client network connectivity should be checked.

#### external-sources-targets

Adds, deletes, or replaces a set of HTML element types and their attributes for which external injections should be checked.

#### flash-cookie-content

Specifies the flash file (in hexadecimal format) used to allow JavaScript to access the Flash object on the client side. The default content is none. The length is limited to 64k.

#### flash-cookie-location

Specifies the BIG-IP URL location of the SWF file that JavaScript requests to get the Flash file. This path cannot be none and must start with '/'.

#### flash-cookies

Specifies, when enabled, that the system may use a Flash shared object (FSO) as a place to store an alternative malware cookie. This cookie tells the system, after a login attempt, that this user has malware, and the system sends an alert.

#### generic-whitelist-words

Deprecated since v13.0.0. Please use generic-whitelist-words in detected-malware instead. Adds, deletes, or replaces a set of generic blacklisted words that are ignored.

#### inline-scripts-whitelist-signatures

Adds, deletes, or replaces a set of signatures for allowed inline scripts. In case a signature appears as part of JavaScript inline script, the system does not count this script in the source integrity feature.

#### removed-scripts

Specifies how the system detects self-removed malicious scripts. You can configure the following options for removed scripts detection:

#### blacklist-functions

Adds, deletes, or replaces a set of functions that are used for detecting self-removed malicious scripts.

#### whitelist-functions

Adds, deletes, or replaces a set of functions that are NOT used for detecting self-removed malicious scripts.

#### source-integrity-location

Specifies the BIG-IP URL path where the system collects information about the HTML source from multiple users. This path cannot be none and must start with '/'.

#### web-rootkit

Specifies how the system detects Web-RootKit malware. You can configure the following options for Web-RootKit detection:

#### blacklist-functions

Adds, deletes, or replaces a set of additional functions to be checked.

#### whitelist-functions

Adds, deletes, or replaces a set of native functions that are allowed to be overwritten.

#### mobilesafe

Specifies how the system detects and prevents phishing, Trojan, and pharming attacks on mobile devices in real time. You can configure the following options for mobile security:

#### alert-custom-config

Specifies alert custom configuration for SDK forward compatibility. Note: For certain advanced configurations, F5 support may provide a relevant string to be entered here, please do not use it on your own.

#### alert-threshold

Specifies the minimal score for sending alerts from mobile devices.

#### app-integrity

Specifies how the system checks if the application on the mobile device has been tampered with. You can configure the following options for Application integrity:

#### custom-config

Specifies custom configuration of Application integrity for SDK forward compatibility. Note: For certain advanced configurations, F5 support may provide a relevant string to be entered here, please do not use it on your own.

[enabled | disabled]

Enables or disables Application integrity.

#### android

Specifies Application integrity settings for Android platform. You can configure the following options for Android Application integrity:

#### score

Specifies Application integrity score for Android platform.

#### signature

Specifies signature of Android application (in hexadecimal format).

ios Specifies Application integrity settings for iOS platform. You can configure the following options for iOS Application integrity:

#### hashes

Adds, deletes, or replaces a set of iOS Application hashes (in base64-encoded format). You can configure the following options for iOS Application hash:

#### version

Specifies iOS Application version for this hash.

#### score

Specifies Application integrity score for iOS platform.

#### general-custom-config

Specifies general custom configuration for SDK forward compatibility. Note: For certain advanced configurations, F5 support may provide a relevant string to be entered here, please do not use it on your own.

#### malware

Specifies how the system checks for malicious applications on the customer's mobile devices. You can configure the following options for Malware detection:

#### android

Specifies Malware detection settings for Android platform. You can configure the following options for Android Malware detection:

#### custom-malware

Adds, deletes, or replaces a custom set of checked malware for Android platform. You can configure the following options for each Android malware:

#### package

Specifies package of checked Android malware.

#### score

Specifies score for checked Android malware.

#### custom-whitelist

Adds, deletes, or replaces a custom set of whitelist applications for Android platform. You can configure the following options for each whitelist Android application:

#### package

Specifies package of whitelist Android application.

#### check-custom

Enables or disables custom malware check.

#### check-generic

Enables or disables generic malware check.

custom-config  
Specifies custom configuration of Malware detection for SDK forward compatibility. Note: For certain advanced configurations, F5 support may provide a relevant string to be entered here, please do not use it on your own.

[enabled | disabled]  
Enables or disables Malware detection.

ios Specifies Malware detection settings for iOS platform. You can configure the following options for iOS Malware detection:

- custom-malware  
Adds, deletes, or replaces a custom set of checked malware for iOS platform. You can configure the following options for each iOS malware:
  - path Specifies path of checked iOS malware.
  - score  
Specifies score for checked iOS malware.
- custom-whitelist  
Adds, deletes, or replaces a custom set of whitelist applications for iOS platform. You can configure the following options for each whitelist iOS application:
  - path Specifies path of whitelist iOS application.

behaviour-analysis  
Specifies how the system checks for suspicious behavior and characteristics on all applications on the customer's mobile devices. You can configure the following options for behavior analysis:

- run Enables or disables behaviour analysis run.
- score  
Specifies score for behavior analysis.

mitm Specifies how the system checks the defined domains for DNS Spoofing and Certificate Forging on customer devices. You can configure the following options for Man-in-the-middle detection:

certificate-custom-config  
Specifies custom configuration of Certificate forging detection for SDK forward compatibility. Note: For certain advanced configurations, F5 support may provide a relevant string to be entered here, please do not use it on your own.

dns-custom-config  
Specifies custom configuration of DNS spoofing detection for SDK forward compatibility. Note: For certain advanced configurations, F5 support may provide a relevant string to be entered here, please do not use it on your own.

domains  
Adds, deletes, or replaces a set of domains for Man-in-the-middle detection. You can configure the following options for a MITM domain:

- dns Specifies DNS spoofing detection settings for this domain. You can configure the following options for DNS spoofing detection:
  - ip-ranges  
Adds, deletes, or replaces a set of IP address ranges for DNS spoofing detection.
  - spoofing-score  
Specifies score for DNS spoofing detection.
  - certificate  
Specifies Certificate forging detection settings for this domain. You can configure the following options for Certificate forging detection:
    - forging-score  
Specifies score for Certificate forging detection.
    - hash Specifies certificate hash.

[enabled | disabled]  
Enables or disables Man-in-the-middle detection.

os-security  
Specifies how the system checks the customer's mobile devices for old, unsupported, and unpatched operation system (OS) versions. You can configure the following options for OS security:

android  
Specifies OS security settings for Android platform. You can configure the following options for Android OS security:

- versions

content to the existing application CSS files.

**application-css-locations**  
Adds, deletes, or replaces a set of server URL locations of the application CSS files, used when application-css is enabled.

**css-attribute-name**  
Specifies the attribute name as part of the CSS content. This name cannot be none.

**css-location**  
Specifies the BIG-IP URL location of the CSS file, used when application-css is disabled. Injecting JavaScript protects the web application against phishing attempts because even if an attacker removes the injected JavaScript from the copied web page, the CSS element is not modified, and this triggers an alert. This path cannot be none and must start with '/'.

**expiration-checks**  
Specifies, when enabled, that the system sends an alert if expired JavaScript engine files are used, as this is an indication of a phishing attack.

**image-location**  
Specifies the BIG-IP URL location of the 1x1 pixel image file. If an attacker copies a web page with this image, it most likely lacks the JavaScript, and this triggers an alert. This path cannot be none and must start with '/'.

**inject-css-element**  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies where the system injects the CSS element. You can configure the following options for CSS element injection position:

[after | before]  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies whether the system injects the CSS element after an opening tag or before a closing tag.

tag  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies the HTML tag for injection of the CSS element. This tag cannot be none.

**inject-css-link**  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies where the system injects the CSS link, when application-css is disabled. You can configure the following options for CSS link injection position:

[after | before]  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies whether the system injects the CSS link after an opening tag or before a closing tag.

tag  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies the HTML tag for injection of the CSS link. This tag cannot be none.

**inject-inline-javascript**  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies where the system injects the phishing inline script and image. You can configure the following options for phishing inline script and image injection position:

[after | before]  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies whether the system injects the phishing inline script and image after an opening tag or before a closing tag.

tag  
Deprecated since v12.1.3 (excluding v13.0.0). Please use same configuration in a specific URL instead. Specifies the HTML tag for injection of the phishing inline script and image. This tag cannot be none.

**protected-elements**  
Adds, deletes, or replaces a set of URLs in requests for which the system verifies (checks) the referrer header value. You can use wildcards, for example \*.gif.

**referrer-checks**  
Specifies, when enabled, that the system verifies (checks) requests coming to the web application for resources from different domains.

**risk-engine-publisher**  
Specifies the name of the log publisher used for reports to a Risk engine.

**rules**  
Adds, deletes, or replaces a set of rules used by the system to perform actions upon detected events. You can configure the following options for each rule:

**action**  
Specifies the type of the action that the system performs

when this event is detected. The options are:

**block-user**

Specifies that the system adds the user with block mode to be enforced from the next login.

**forensic**

Specifies that the system adds the user with forensic mode to be enforced from the next login.

**inspection**

Specifies that the system adds the user with inspection mode to be enforced from the next login.

**redirect**

Specifies that the system redirects the next request to a specific web page.

**remediation**

Specifies that the system adds the user with remediation mode to be enforced from the next login.

**route**

Specifies that the system routes to a specific pool all subsequent requests for a specific time.

**web-service**

Specifies that the system sends a POST request to a specific Web service.

**duration**

Specifies number of minutes during which the system performs the action block-user, forensic, inspection, remediation or route.

**enforce-policy**

Specifies enforcement policy for the action block-user, forensic, inspection or remediation. The options are:

**enforce**

Specifies that the system adds the user mode with the enforce policy.

**time-limited**

Specifies that the system adds the user mode with the time-limited policy.

**unlimited**

Specifies that the system adds the user mode with the unlimited policy.

**event**

Specifies a unique event for the rule. This option is required for the operations create, delete, modify, and replace-all-with. The options are:

**auto-transaction**

Specifies that the action is performed when the system detects automatic (bot) transaction.

**client-network-connection**

Specifies that the action is performed when the system detects that client network connectivity is blocked.

**client-side-missing-components**

Specifies that the action is performed when the system detects missing components on the client side.

**encryption-failure**

Specifies that the action is performed when the system fails to decrypt a password.

**generic-malware**

Specifies that the action is performed when the system detects generic malware.

**mandatory-words**

Specifies that the action is performed when the system detects that mandatory words are changed in the page.

**phishing**

Specifies that the action is performed when the system detects a phishing attempt.

**phishing-user**

Specifies that the action is performed when the system detects a user attacked by a phishing attempt.

**rat-detection**

Specifies that the action is performed when the system detects a Remote Access Trojan (RAT) on a client web browser.

**referrer-checks**

Specifies that the action is performed when the system detects a request from a different domain by the referrer header.

**server-side-missing-components**

Specifies that the action is performed when the system detects missing components on the BIG-IP.

**source-integrity**

Specifies that the action is performed when the system

detects a mismatch of the URL's HTML source code.

#### web-injection

Specifies that the action is performed when the system detects an attempt to inject malware.

#### min-score

Specifies the lowest score of this event necessary for the system to perform the action.

#### payload

Specifies the payload for the web-service action.

pool Specifies the name of the pool for the route action.

#### publisher

Specifies the name of the log publisher for the web-service action.

url Specifies the URL for the action redirect or web-service.

#### suggested-username-header

Specifies the name of the custom HTTP header in AJAX requests added by JavaScript with a username value identified on the client side.

#### trigger-irule

Specifies, when enabled, that the system activates Anti-fraud iRule events. The default value is disabled.

urls Adds, deletes, or replaces a set of URLs in the web application that are protected by the system. You can configure the following options for a protected URL:

#### app-layer-encryption

Specifies when the system performs Application layer encryption. With Application layer encryption, the system detects an attempt to steal and tamper with end-user passwords (or other protected information), and also prevents it by encrypting the protected information. You can configure the following options for Application layer encryption:

#### add-decoy-inputs

Specifies, when enabled, that the system randomly and continuously generates and removes decoy  fields that are added to the web page, thus making it harder for an attacker to identify sensitive information with either JavaScript or a proxy. In order to enable it, you must first enable html-field-obfuscation.

#### custom-encryption-function

Specifies the name or implementation of custom encryption function to be run instead of built-in encryption.

#### [enabled | disabled]

Specifies whether the system protects this URL with Application layer encryption, and sends an alert if an attacker attempts to breach Application layer encryption for this URL, or not.

#### fake-strokes

Specifies, when enabled, that the system protects against in-browser key loggers by generating fake keyboard events.

#### full-ajax-encryption

Specifies, when enabled, that the system encrypts the full AJAX payload.

#### hide-password-revealer

Specifies, when enabled, that the system hides the password revealer icon found in web pages.

#### html-field-obfuscation

Specifies, when enabled, that the system encrypts the names of defined  fields on the client, and then decrypts them back to the original names on the BIG-IP.

#### real-time-encryption

Specifies, when enabled, that the system encrypts passwords as they are typed (even before the user clicks the Submit button in a web form).

#### remove-element-ids

Specifies, when enabled, that the system removes the ID attribute from the  fields in a web form. In order to enable it, you must first enable html-field-obfuscation.

#### remove-event-listeners

Specifies, when enabled, that the system removes event listeners from the encrypted  fields in a web form.

#### stolen-creds

Specifies, when enabled, that the system examines whether the user was trying to use a fabricated password.

#### substitute-value-function

Specifies a JavaScript function that receives the real password as an argument and returns a fake value.

#### auto-transactions

Specifies how the system protects this URL from automatic (bot) transactions. You can configure the following options for Automated transactions detection:

#### bot-score

Specifies the score added to an alert that is triggered if the system determines that the client is a bot and not a human. The default is a score of 50.

#### browser

Specifies, when enabled, that the system looks for bot automation performed within the browser.

#### click-score

Specifies the score added to an alert that is triggered if the min-mouse-over-count and min-mouse-move-count conditions are not met. The default is a score of 40.

#### [enabled | disabled]

Specifies whether the system protects this URL against non-human transactions, and sends an alert if the system detects a non-human transaction attempt for this URL, or not.

#### full-ajax-integrity

Specifies, when enabled, that the system verifies whether the full AJAX payload was changed by malware when it left the browser for the server.

#### integrity-fail-score

Specifies the score added to an alert that is triggered if the system detects a difference between the actual parameter value and the expected value of a protected parameter sent after a user clicks a web form's Submit button. The default is a score of 40.

#### min-mouse-move-count

Specifies the minimum number of mouse movements necessary per page load in order for the system to consider the transaction to be of human origin. The default is 5 movements.

#### min-mouse-over-count

Specifies the minimum number of times the client's mouse is positioned over the Submit button in a web form in order for the system to consider the transaction to be of human origin. The default is 2 button interactions.

#### min-report-score

Specifies the lowest score necessary for the system to send an alert. The default value is 50.

#### min-time-to-request

Specifies the minimum amount of time (in seconds) permitted between when a web form is opened and the Submit button is clicked. The default is 2 seconds.

#### non-browser

Specifies, when enabled, that the system looks for bot automation performed not within the browser.

#### not-human-score

Specifies the score added to an alert that is triggered if the system only suspects that the client is a bot and not a human. The default is a score of 25.

#### strong-integrity

Specifies, when enabled, that the system detects a difference between the actual parameter value and the expected value of a protected parameter verified with physical input events.

#### submit-buttons

Adds, deletes, or replaces a set of non-standard Submit buttons found in forms of the web application. You can specify the name, or the CSS syntax (ID, class, or tagname) for each button.

#### tampered-cookie-score

Specifies the score added to an alert that is triggered if the system detects that the transaction-data cookie was tampered with. The default is a score of 50.

#### time-fail-score

Specifies the score added to an alert that is triggered if the min-time-to-request condition is not met. The default is a score of 20.

#### custom-alerts

Adds, deletes, or replaces a set of user-defined alerts sent by the system upon searches in different parts of the request. You can configure the following options for each user-defined alert:

#### component

Specifies the alert component that the system sends in this alert. Select either: malware (the default value), phishing, auto-transactions, or mobilesafe.

#### header-name

Specifies a header name in which the system searches for the value when search-in is header.

**malware-name**  
Specifies the malware detected by this alert when component is malware.

**message**  
Specifies the user-defined message that the system sends in this alert.

**search-in**  
Specifies the part of the request where the system must find the value to send this alert. Note: If you create a user-defined alert, you can use either request part, thereafter it becomes read only.

**client-ip**  
Specifies that the systems sends this alert if the client IP address equals to the value.

**header**  
Specifies that the systems sends this alert if the header-name header contains the value.

**payload**  
Specifies that the systems sends this alert if the request payload contains the value.

**query-string**  
Specifies that the systems sends this alert if the URL query string contains the value.

**value**  
Specifies a value that the system searches for in the search-in part of the request. The default value is none, which means that the system searches for any value.

**description**  
Specifies an optional description of this URL.

**include-query-string**  
Specifies, when enabled, that the system includes query string of URLs to match this wildcard expression. The default value is disabled.

**inject-javascript**  
Enables or disables JavaScript injection into responses to this URL. The default value is enabled.

**inject-main-javascript**  
Specifies where the system injects the main JavaScript. You can configure the following options for main JavaScript injection position:

[after | before]  
Specifies whether the system injects the main JavaScript after an opening tag or before a closing tag.

**tag** Specifies the HTML tag for injection of the main JavaScript. This tag cannot be none.

**login-response**  
Specifies validation criteria on the response of this URL when it is Login page. You must configure at least one of them. If you configure more than one validation criteria, then all the criteria must be fulfilled for successful login. You can configure the following Login page properties:

**status-code**  
Specifies an HTTP response status code that the server must return to the user upon successful login.

**domain-cookie**  
Specifies a defined domain cookie that the successful response to the login URL must include.

**exclude-string**  
Specifies a string that should NOT appear in the successful response to the login URL.

**header**  
Specifies a header name and value that the successful response to the login URL must match.

**include-string**  
Specifies a string that should appear in the successful response to the login URL.

**validation**  
Enables or disables successful login validation.

**malware**  
Specifies when the system detects attempts of attackers to inject malware in the URL. You can configure the following options for Malware detection:

**attach-html-to-alerts**  
Specifies, when enabled, that the system attaches forensics information along with the alerts.

**auto-learn-form-tags**  
Specifies, when enabled, that the system learns the number of HTML form tags that appear in the URL. In order to enable it, you must first enable source-

integrity.

auto-learn-input-tags  
Specifies, when enabled, that the system learns the number of HTML input tags that appear in the URL. In order to enable it, you must first enable source-integrity.

auto-learn-script-tags  
Specifies, when enabled, that the system learns the number of HTML script tags that appear in the URL. In order to enable it, you must first enable source-integrity.

blocked-enter-key-detection  
Specifies, when enabled, that the system detects blocked "Enter" key.

domain-availability  
Specifies, when enabled, that the system checks that client network connectivity is not blocked by malware.

enable-symbols  
Specifies, when enabled, that the system looks for malware strings (signatures) within JavaScript.

[enabled | disabled]  
Specifies whether the system protects this URL against injected malware, and sends an alert if this URL is detected to have malware, or not.

external-injection  
Specifies, when enabled, that the system detects malicious scripts injected from domains not in the profile's allowed-domains.

generic-malware  
Specifies, when enabled, that the system applies the detection of generic malware, using honeypots.

manual-count-form-tags  
Specifies the number of HTML forms that appear in the URL.

manual-count-input-tags  
Specifies the number of HTML inputs that appear in the URL.

manual-count-script-tags  
Specifies the number of HTML scripts that appear in the URL.

rat-detection  
Specifies, when enabled, that the system checks for Remote Access Trojans (RATs) on clients' web browsers.

removed-scripts-detection  
Specifies, when enabled, that the system detects malicious scripts that removed their own injection from the DOM.

source-integrity  
Specifies, when enabled, that the system verifies that the URL's HTML source code matches the HTML code sent from the server. The source integrity feature counts script tags that are external (with src) and inline (without src).

vbklip-detection  
Specifies, when enabled, that the system checks for VBKlip malware.

visibility-check  
Specifies, when enabled, that the system searches HTML pages for words from visibility-check-items.

visibility-check-items  
Adds, deletes, or replaces a set of words that must appear in the web site's HTML pages and may not be changed. If these words are changed, the system sends an alert.

web-rootkit-detection  
Specifies, when enabled, that the system detects malware that overwrites native browser functions.

whitelist-words  
Adds, deletes, or replaces a set of words that are permitted to appear in requests for this URL, even though they are otherwise blacklisted by the system for other URLs.

mobilesafe-encryption  
Specifies, when enabled, that the system protects requests for this URL from mobile devices with Application layer encryption.

parameters  
Adds, deletes, or replaces a set of sensitive parameters protected by the system. You can configure the following options for each parameter:

attach-to-vtoken-report  
Specifies, when enabled, that the system adds the

parameter value data to the alerts.

#### check-integrity

Specifies, when enabled, that the system verifies whether the user-input data was changed by malware when it left the browser for the server.

#### encrypt

Specifies, when enabled, that the system encrypts the parameter's value attribute.

#### identify-as-username

Specifies, when enabled, that the system considers this parameter a username. Note: There may be only one such parameter per URL, and its value is used only when login is successful (according to the URL's login-response).

#### method

Specifies the method of the request from which the systems gets the parameter data. Select either: POST (the default value) or GET.

#### mobilesafe-encrypt

Specifies that this parameter contains the encrypted fields from mobile devices. Note: There may be only one such parameter per URL (usually called auth), it cannot have other settings enabled and its method must be POST.

#### mobilesafe-entangle

Specifies that this parameter must be encrypted by mobile devices. The system replaces its value in the request payload and sends an alert if the mobilesafe-encrypt parameter does not contain this field.

#### obfuscate

Specifies, when enabled, that the system encrypts the parameter's name attribute.

#### substitute-value

Specifies, when enabled, that the system substitutes the parameter's value with asterisks [\*] in the web application while the form is being filled. In order to enable it, you must first enable encrypt.

#### phishing

Specifies when the system detects phishing attempts by attackers who set up a fake URL that imitates the real URL. You can configure the following options for Phishing detection:

#### capture-users

Specifies, when enabled, that the system logs the usernames and text fields (not passwords) of users attacked by a phishing attempt.

#### copy-detection

Specifies, when enabled, that the system detects copied web pages.

#### css-protection

Specifies, when enabled, that the system activates the CSS module, which is part of the system's phishing detection backup mechanism.

#### [enabled | disabled]

Specifies whether the system protects this URL against phishing, and sends an alert if the system detects this URL to be under a phishing attempt, or not.

#### field-types-to-send

Adds, deletes, or replaces a set of HTML input types whose values should be included in phishing alerts.

#### inject-css-element

Specifies where the system injects the CSS element. You can configure the following options for CSS element injection position:

#### [after | before]

Specifies whether the system injects the CSS element after an opening tag or before a closing tag.

tag Specifies the HTML tag for injection of the CSS element. This tag cannot be none.

#### inject-css-link

Specifies where the system injects the CSS link, when application-css is disabled. You can configure the following options for CSS link injection position:

#### [after | before]

Specifies whether the system injects the CSS link after an opening tag or before a closing tag.

tag Specifies the HTML tag for injection of the CSS link. This tag cannot be none.

#### inject-inline-javascript

Specifies where the system injects the phishing inline script and image. You can configure the following options for phishing inline script and image injection position:

[after | before]  
Specifies whether the system injects the phishing inline script and image after an opening tag or before a closing tag.

tag Specifies the HTML tag for injection of the phishing inline script and image. This tag cannot be none.

priority  
Specifies a unique ordinal number for this URL in the set of wildcard URLs.

type Specifies a type of the URL. Note: If you create a URL, you can use either type, thereafter it becomes read only. The options are:

explicit  
Specifies that the URL has an exact path. This is the default value.

wildcard  
Specifies that any URL that matches this wildcard expression is considered protected.

users  
Adds, deletes, or replaces a set of users enforced by the system upon successful login. You can configure the following options for an enforced user:

modes  
Adds or deletes a single mode in the set of existing user modes.

mode Specifies a unique mode for the user. This option is required for the operations add and delete. The options are:

block  
Specifies that the system blocks the user account by displaying blocking-page.

forensic  
Specifies that the system enforces the user to run Forensics tool on his host by displaying forensic html.

inspection  
Specifies that the system turns on verbose activity logging for this user, i.e. collects all HTML and JS sources from sessions and sends this data to the dashboard.

remediation  
Specifies that the system enforces the user to run Forensics tool in remediation mode that deploys Anti-malware client on his host by displaying forensic html.

duration  
Specifies number of minutes during which the user is enforced in this mode since its first login, when enforce-policy is time-limited. After their expiration the user mode will be removed automatically.

enforce-policy  
Specifies enforcement policy for this user mode. The options are:

enforce  
Specifies that the user must download and run Forensics tool in order to continue online actions. Note: This policy may be specified only for the modes forensic and remediation.

time-limited  
Specifies that the user is enforced in this mode for a limited time, namely until first-login-time + duration minutes. When this policy is specified for the modes forensic and remediation, the user may skip downloading and running Forensics tool every time.

unlimited  
Specifies that the user is enforced in this mode for unlimited time. When this policy is specified for the modes forensic and remediation, the user may skip downloading and running Forensics tool every time.

first-login-time  
Displays time when the user firstly logged in being in this mode. A new user mode is added with value none and it is updated automatically during traffic, when enforce-policy is time-limited.

whitelist-custom-alerts  
Specifies a list of predefined alerts that are ignored.

## security anti-fraud signatures-update

**NAME**  
signatures-update - Runs or loads an Anti-fraud signatures update.

**MODULE**  
security anti-fraud

**SYNTAX**  
Configure, run or load the signatures-update component within the security anti-fraud module using the syntax in the following sections:

**MODIFY**  
modify security anti-fraud signatures-update  
options:  
update-automatically [enabled | disabled]

edit security anti-fraud signatures-update  
options:  
all-properties  
non-default-properties

**LOAD**  
load signatures-update  
options:  
file [filename]

**RUN**  
run signatures-update

**DISPLAY**  
list signatures-update  
options:  
all-properties  
current-version-create-datetime  
download-available  
install-datetime  
install-user  
message  
non-default-properties  
one-line  
partition  
progress-status  
progress-status-datetime  
readme  
update-automatically

**DESCRIPTION**  
You can use the signatures-update component to run, load, configure or display status of signatures update.

**EXAMPLES**  
list security anti-fraud signatures-update  
  
Displays the status of signatures update.

**OPTIONS**  
current-version-create-datetime  
Displays the creation time of currently installed signatures update version.  
  
download-available  
Displays whether new signatures version is available for download from the cloud.  
  
file Specifies the file name from which the signatures update is going to be installed when using the load command. A full path should be specified.  
  
install-datetime  
Displays the time when signatures update was installed.  
  
install-user  
Displays the name of the user who installed the last signatures update.  
  
message  
Displays the message describing the failure status of signatures update.  
  
partition

Displays the administrative partition within which this object resides.

`progress-status`  
Displays the signatures update progress status.

`progress-status-datetime`  
Displays the time when signatures update progress status was last changed.

`readme`  
Displays the Readme content for the current signatures update.

`update-automatically`  
Enables or disables automatic nightly update.

## security blacklist-publisher all-blacklist-publisher

NAME

`all-blacklist-publisher` - Show command for blacklist publisher for use by firewall. An `all-blacklist-publisher` shows all the category records and their associated profiles.

MODULE

`security blacklist-publisher`

SYNTAX

Shows the category component within the `security blacklist-publisher` module using the syntax in the following sections.

`show all-blacklist-publisher`

EXAMPLES

`show all-blacklist-publisher`

Displays all the blacklist publisher records. Each record displays its category, profile association, route domain, traffic group, next hop, advertised count, and deadadvertised count.

FIELDS

`category name`  
Specifies the category which is associated with the profile.

`profile name`  
Specifies the profile which is associated with the category.

`route domain`  
Specifies the route domain in the route advertisement.

`traffic group`  
Specifies the traffic group which will be utilized in route injection fault tolerance.

`next hop`  
Specifies the next-hop address which will be utilized in route advertisement in blackhole routes.

`advertised count`  
Specifies the number of times this route has been advertised.

`deadadvertised count`  
Specifies the number of times this route has been dropped.

SEE ALSO

`show`, `profile category`, `security`, `security blacklist-publisher`, `tmsh`

COPYRIGHT

## security blacklist-publisher blacklist-publisher-stats

**NAME**  
 blacklist-publisher-stats - Show/reset-stats command for blacklist publisher for use by firewall. A blacklist-publisher-stats shows all the category records and their associated profiles.

**MODULE**  
 security blacklist-publisher

**SYNTAX**  
 Shows the category component within the security blacklist-publisher module using the syntax in the following sections.

```
show blacklist-publisher-stats
show blacklist-publisher-stats category-name [\partition\name]
show blacklist-publisher-stats profile-name [\partition\name]
show blacklist-publisher-stats category-name [\partition\name] profile-name [\partition\name]
```

Reset-Stats the category component within the security blacklist-publisher module using the syntax in the following sections.

```
reset-stats blacklist-publisher-stats
reset-stats blacklist-publisher-stats category-name [\partition\name]
reset-stats blacklist-publisher-stats profile-name [\partition\name]
reset-stats blacklist-publisher-stats category-name [\partition\name] profile-name [\partition\name]
```

**SHOW EXAMPLES**  
 show blacklist-publisher-stats

Displays all the blacklist publisher records. Each record displays its category, profile association, advertised count, and deadadvertised count.

**FIELDS**  
 category\_name  
 Specifies the category which is associated with the profile.

profile\_name  
 Specifies the profile which is associated with the category.

advertise\_it  
 Specifies the number of times this route has been advertised.

deadadvertise\_it  
 Specifies the number of times this route has been dropped.

```
show blacklist-publisher-stats category_name <\Common\botnets
```

Displays blacklist publisher records that are associated with "botnets" category. Each record displays its category, profile association, advertised count, and deadadvertised count.

**FIELDS**  
 category\_name  
 Specifies the category which is associated with the profile.

profile\_name  
 Specifies the profile which is associated with the category.

advertise\_it  
 Specifies the number of times this route has been advertised.

deadadvertise\_it  
 Specifies the number of times this route has been dropped.

```
show blacklist-publisher-stats profile_name <\Common\botnets-profile
```

Displays blacklist publisher records that are associated with "botnets-profile" profile. Each record displays its category, profile association, advertised count, and deadadvertised count.

**FIELDS**  
 category\_name  
 Specifies the category which is associated with the profile.

profile\_name  
 Specifies the profile which is associated with the category.

advertise\_it  
 Specifies the number of times this route has been advertised.

deadadvertise\_it  
 Specifies the number of times this route has been dropped.

```
show blacklist-publisher-stats category_name <\Common\botnets
profile_name <\Common\botnets-profile>
```

Displays blacklist publisher records that are associated with "botnets" category and "botnets-profile" profile. Each record displays its category, profile association, advertised count, and deadadvertised

count.

#### FIELDS

category\_name  
Specifies the category which is associated with the profile.

profile\_name  
Specifies the profile which is associated with the category.

advertise\_it  
Specifies the number of times this route has been advertised.

deadvertise\_it  
Specifies the number of times this route has been dropped.

#### RESET\_STATS EXAMPLES

```
reset-stats blacklist-publisher-stats

Reset stats for all the blacklist publisher records.

reset-stats blacklist-publisher-stats category_name <\Common\botnets

Reset stats of all blacklist publisher records that are associated with
"\Common\botnets" category.

reset-stats blacklist-publisher-stats profile_name
<\Common\botnets-profile

Reset stats of all blacklist publisher records that are associated with
"\Common\botnets-profile" profile.

reset-stats blacklist-publisher-stats category_name <\Common\botnets
profile_name <\Common\botnets-profile>

Reset stat of all the blacklist publisher records that are associated
with "\Common\botnets" category and "\Common\botnets-profile" profile.
```

## security blacklist-publisher by-category

#### NAME

by-category - Show command for blacklist publisher for use by firewall. A by-category shows all the category records and their associated profiles for the specified category name.

#### MODULE

security blacklist-publisher

#### SYNTAX

Shows the category component within the security blacklist-publisher module using the syntax in the following sections.

```
show by-category category-name [[name] | all]
```

#### EXAMPLES

```
show by-category category-name /Common/botnets show by-category
category-name all
```

Displays all the blacklist publisher records for the specified category.

#### FIELDS

category name  
Specifies the category which is associated with the profile.

profile name  
Specifies the profile which is associated with the category.

route domain  
Specifies the route domain in the route advertisement.

traffic group  
Specifies the traffic group which will be utilized in route injection fault tolerance.

next hop  
Specifies the next-hop address which will be utilized in route

advertisement in blackhole routes.

**shun-ip**  
Specifies the shun ip to be advertised.

**time-to-live**  
Specifies the amount of time left until this route will be dropped.

**advertised**  
Specifies whether this record is currently being advertised.

SEE ALSO  
show, profile category, security, security blacklist-publisher, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2security8blacklist-publisher by-category(1)

---

## security blacklist-publisher by-shun

**NAME**  
by-addr - Show command for blacklist publisher for use by firewall. A by-addr shows all the category records and their associated profiles for the specified shun address.

**MODULE**  
security blacklist-publisher

**SYNTAX**  
Shows the shun-ip component within the security blacklist-publisher module using the syntax in the following sections.

show by-addr [enter IP address, IP address/prefix, or IP address range (two addresses separated by a hyphen).]

**EXAMPLES**  
show by-addr 8.8.8.8 show by-addr 8.8.8.8/24 show by-addr 8.8.8.8-8.8.8.10

Displays all the blacklist publisher records for the specified shun address.

**FIELDS**  
IP Address  
Specifies the shun ip to be advertised.

category name  
Specifies the category which is associated with the profile.

profile name  
Specifies the profile which is associated with the category.

route domain  
Specifies the route domain in the route advertisement.

traffic group  
Specifies the traffic group which will be utilized in route injection fault tolerance.

next hop  
Specifies the next-hop address which will be utilized in route advertisement in blackhole routes.

time-to-live  
Specifies the amount of time left until this route will be dropped.

SEE ALSO  
show, profile category, security, security blacklist-publisher, tmsh

BIG-IP 2015-security blacklist-publisher by-shun(1)

---

## security blacklist-publisher category

**NAME**  
category - Configures a blacklist publisher category for use by firewall. A category enables a user to advertise shuns based on the route-advertisement-nexthop value(s) in the category's associated profile(s).

**MODULE**  
security blacklist-publisher

**SYNTAX**  
Configure the category component within the security blacklist-publisher module using the syntax in the following sections.

```
CREATE/MODIFY
create category [name]
modify category [name]
options:
  profile-names [add | default | delete | none | replace-all-with] {
    [name]
  }
```

```
edit category [[name] | all]
options:
  all-properties
  non-default-properties
```

```
list category [[name] | all | [property]]
show running-config profile [[name] | all | [property]]
options:
  all-properties
  non-default-properties
  one-line
```

```
DELETE
delete category [[name] | all | recursive]
```

Note: If the category is referencing any profile the delete will fail.

**DESCRIPTION**  
You can use the category component to create, modify, display, or delete a blacklist-publisher category.

**EXAMPLES**

```
create category botnets profile-names add { botnets-profile }
```

Creates the above category and adds the profile (botnets-profile).

```
modify category botnets profile-names delete { botnets-profile }
```

Modifies the above category by deleting the profile (botnets-profile).

```
delete category botnets
```

Deletes the above category.

```
list category botnets
```

Displays the properties of the above category.

**OPTIONS**  
profile-names  
Specifies the profiles referenced in the category.

**SEE ALSO**  
create, delete, edit, modify, list, profile, security, security blacklist-publisher, tmsb

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2015security blacklist-publisher category(1)

---

## security blacklist-publisher profile

**NAME**  
profile - Configures a publisher profile for use by firewall. A profile specifies the network path and method (how and where) the IP-Intelligence Blacklist data will be advertised.

**MODULE**  
security blacklist-publisher

**SYNTAX**  
Configure the profile component within the security blacklist-publisher module using the syntax in the following sections.

```
CREATE/MODIFY
create profile [name]
modify profile [name | all]
options:
  description [string]
  route-domain [name]
  traffic-group [name]
  route-advertisement-nexthop [IP address]

edit profile [[name] | all]
options:
  all-properties
  non-default-properties

list profile [[name] | all | [property]]
show running-config profile [[name] | all | [property]]
options:
  all-properties
  non-default-properties
  one-line
```

```
DELETE
delete profile [[name] | all | recursive]
```

Note: If the profile is referenced in a category the delete will fail.

**DESCRIPTION**  
You can use the profile component to create, modify, display, or delete a blacklist-publisher profile.

**EXAMPLES**

```
create profile botnets-profile { route-domain 0 traffic-group
traffic-group-1 route-advertisement-nexthop 10.10.10.1 }
```

Creates the above profile with the specified route-domain, traffic-group, and route-advertisement-nexthop.

```
modify profile botnets-profile description "this profile is used for
botnets category"
```

Modifies the above profile with a description.

```
delete profile botnets-profile
```

Deletes the above profile.

```
list profile botnets-profile
```

Displays the properties of the above profile.

**OPTIONS**

**description**  
User defined description.

**route-advertisement-nexthop**  
Specifies the next-hop address which will be utilized in route advertisement in blackhole routes.

**route-domain**  
Specifies the route-domain in the route advertisement.

**traffic-group**  
Specifies the traffic group which will be utilized in route injection fault tolerance.

**SEE ALSO**  
create, delete, edit, list, modify, category, security, security blacklist-publisher, tmsh

**COPYRIGHT**

## security datasync device-stats

**NAME**  
device-stats - Display the Datasync Framework device stats.

**MODULE**  
security datasync

**SYNTAX**  
Display the device-stats component within the security datasync module using the syntax shown in the following sections.

**DISPLAY**  
list device-stats  
list device-stats [ [ [name] | [glob] | [regex] ] ... ]  
show running-config device-stats  
show running-config device-stats [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line  
partition  
recursive

**DESCRIPTION**  
You can use the device-stats component to display the datasync device-stats for that are updated by the Datasync Framework.

**OPTIONS**  
device  
Displays the device name reflected by the stats.  
  
table  
Displays the table type reflected by the stats.  
  
profile-chksum  
Displays the checksum of the current active profile.  
  
activation-epoch  
Displays the activation epoch of the current active generation.  
  
rows-available  
Displays the number of available rows in the current active buffer.  
  
rows-in-use  
Displays the number of rows that are in use in the current active buffer.

**SEE ALSO**  
create, delete, edit, glob, list, modify, regex, show, tmsh, trust-domain

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## security datasync global-profile

**NAME**  
global-profile - Manage the Datasync Framework settings that are globally synced across devices.

**MODULE**  
security datasync

**SYNTAX**  
Manage the global-profile component within the security datasync module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create global-profile [name]  
modify global-profile [name]  
options:  
table [name]  
activation-epoch [ auto | [integer] ]  
deactivation-epoch [ deactivated | always-active | [integer] ]  
min-rows [ default | [integer] ]  
max-rows [ default | [integer] ]  
regen-time-offset [ default | [integer] ]

```
regen-interval [ default | none | [integer] ]
grace-time [ default | [integer] ]
master-key [string]
scramble-alg [string]
hash-alg [string]
mac-alg [string]
mode-of-op [string]
rsa-exp [ none | rsa-3 | rsa-f4 | default ]
rsa-bits [ default | none | [integer] ]
params [string]
```

```
edit global-profile [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

#### DISPLAY

```
list global-profile
list global-profile [ [ [name] | [glob] | [regex] ] ... ]
show running-config global-profile
show running-config global-profile [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

#### DELETE

```
delete global-profile [name]
```

#### DESCRIPTION

You can use the global-profile component to create, modify, display, or delete a datasync global-profile for use with the Datasync Framework. All global-profiles must reside in the automatically created /Common/datasync-global folder. These profiles are synced across all of the devices in the trust domain using the manually-synced device-group datasync-global-dg.

Warning: Creating, modifying or deleting global-profiles may result in the system being offline, in the case of a bad configuration.

#### EXAMPLES

```
create global-profile /Common/datasync-global/my_global_profile table
table_name
```

Creates a custom datasync global-profile named my\_global\_profile for table table\_name with initial settings, a random master-key, and an activation-epoch 30 minutes in the future.

```
list global-profile /Common/datasync-global/*
```

Displays the properties of all datasync global-profiles.

#### OPTIONS

**table**  
Specifies the table to which the profile belongs.

**activation-epoch**  
Specifies the epoch at which the profile becomes active, in UNIX-time.

**deactivation-epoch**  
Specifies the epoch at which the profile becomes inactive, in UNIX-time.

**create-timestamp**  
Displays the timestamp at which the profile was created, in UNIX-time.

**min-rows**  
Specifies the minimum number of rows to generate before going online.

**max-rows**  
Specifies the maximum number of rows to generate.

**regen-time-offset**  
Specifies the time offset at which regeneration will be done, in seconds.

**regen-interval**  
Specifies the time interval at which regeneration will be done, in seconds.

**grace-time**  
Specifies the grace time during which new buffers are supported, but not yet activated, in seconds.

**master-key**  
Specifies the secured master key upon which all cryptography is based. Use \"auto\" to generate a random key.

**scramble-alg**  
Specifies the scrambling algorithm to use.

**hash-alg**  
Specifies the hashing algorithm to use.

**mac-alg**  
Specifies the MAC algorithm to use.

**mode-of-op**  
Specifies the scrambling mode-of-operation to use.

rsa-exp  
Specifies the RSA exponent.

rsa-bits  
Specifies the number of bits to use for RSA keys.

params  
Specifies additional internal parameters.

## security datasync local-profile

NAME

local-profile - Manage the Datasync Framework settings that are local, and not synced across devices.

MODULE

security datasync

SYNTAX

Manage the local-profile component within the security datasync module using the syntax shown in the following sections.

MODIFY

```
modify local-profile [table_name]
options:
  buf-size [integer]
  ds-area [ none | asm | fps ]
  rows-bulk [integer]
  gen-timeout-sec [integer]
  min-mem-mb [integer]
  min-cpu-percent [integer]
  max-gen-rows [ infinite | [integer] ]
  keep-conf-files [integer]
  gen-pause-sec [integer]
  offline-until-gen [ enable | disable ]
```

```
edit local-profile [table_name]
options:
  all-properties
  non-default-properties
```

DISPLAY

```
list local-profile
list local-profile [table_name]
show running-config local-profile
show running-config local-profile [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

DESCRIPTION

You can use the local-profile component to modify or display a datasync local-profile for use with the Datasync Framework. Each profile is for a single table. The profiles cannot be created or deleted, only modified. These profiles are local; they are not synced across devices.

OPTIONS

buf-size  
Specifies the size of each buffer in the table, in bytes.

ds-area  
Specifies the memory area on which the table will be allocated.

rows-bulk  
Specifies the number of rows to generate in each bulk.

gen-timeout-sec  
Specifies the timeout of running the external generator per single bulk.

min-mem-mb

Specifies the minimum available memory in MB to start generator in non-urgent mode.

`min-cpu-percent`  
Specifies the minimum available CPU percent to start generator in non-urgent mode.

`max-gen-rows`  
Specifies the maximum rows to generate.

`keep-conf-files`  
Specifies the number of configuration files to keep when rolling old ones.

`gen-pause-sec`  
Specifies the time in seconds to pause between each bulk generation when in non-urgent mode.

`offline-until-gen`  
Specifies if the system should be offline until the table is generated.

SEE ALSO

`edit`, `list`, `modify`, `show`, `tmsh`

## security device-id attribute

**NAME**  
`device-id` - Configures Device-ID collected attributes.

**MODULE**  
`security`

**SYNTAX**  
Configure the `device-id` component within the `security` module using the syntax shown in the following sections.

**MODIFY**  
`modify attribute [name]`  
`options:`  
`collect {`  
`[enabled | disabled]`  
`}`

**DISPLAY**  
`list device-id`

**DESCRIPTION**  
You can use the `device-id` component to modify or display a Device-ID attribute collection.

**EXAMPLES**  
`modify device-id attribute att05 {collect disabled}`  
Disables collection of `att05` by Device-ID JavaScript.  
`list device-id`  
Displays the properties of all `device-id` attributes.

**OPTIONS**  
`attribute`  
Specifies the Device-ID category to be configured.

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

You forgot a `'=back'` before `'=head1'`

## security device device-context

**NAME**  
device-context - Configures the security device context policies.

**MODULE**  
security device

**SYNTAX**

**MODIFY**  
modify device-context  
options:  
description [string]  
nat-policy [ [policy\_name] | none ]

edit device-context  
options:  
all-properties  
non-default-properties

reset-stats device-context  
nat-rules { [rule name] }

**DISPLAY**  
list device-context  
show running-config device-context nat-rules  
  
show device-context nat-rules

**DESCRIPTION**  
You can use the device-context component to configure device level (a.k.a global) policies.

**EXAMPLES**  
modify device-context nat-policy policy1  
  
Configures nat policy named policy1 to be used as the device level nat policy.  
  
list device-context  
  
security device device-context {  
nat-policy /Common/policy1  
}  
  
Displays the current list of policies at device context level.

**OPTIONS**

description  
Specifies nat policies on device context level.

nat-policy  
Specifies a NAT policy. This is the policy used to match incoming traffic to a virtual server and perform source/destination translations (as per the matched NAT rule) if and only if: virtual server does not have a NAT policy configured (see ltm virtual) AND virtual server has nat-policy.use-route-domain-policy disabled OR virtual server has nat-policy.use-route-domain-policy enabled but the route domain does not have a NAT policy configured AND virtual server has nat-policy.use-device-policy enabled.

nat-rules  
Specifies security nat rules enforced on device context level via referenced nat-policy.

**SEE ALSO**  
edit, list, modify, security firewall address-list, security firewall port-list, security nat policy, security log profile, security nat source-translation, security nat destination-translation, ltm virtual, show, tmsh

## security dos behavioral-signature

**NAME**  
behavioral-signature - Configures a Behavioral Bot Signature.

**MODULE**  
security dos

**SYNTAX**  
Configure the behavioral-signature component within the security dos module using the syntax shown in the following sections.

**MODIFY**  
modify behavioral-signature [name]  
options:  
alias [name]  
status [approved | new | revoked ]

**DISPLAY**  
list behavioral-signature

**DELETE**  
delete behavioral-signature [name]

**DESCRIPTION**  
You can use the behavioral-signature component to modify, display, or delete a Behavioral Signature.

**EXAMPLES**  
list behavioral-signature  
  
Displays the properties of all Behavioral Signatures.

**OPTIONS**  
alias  
Specifies the behavioral signature user defined alias.  
  
status  
Specifies the behavioral signature status.

**SEE ALSO**  
edit, list, modify, security, security dos, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## security dos bot-signature-category

**NAME**  
bot-signature-category - Configures the Bot Signature Categories.

**MODULE**  
security dos

**SYNTAX**  
Configure the bot-signature-category component within the security dos module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create bot-signature-category [string]  
modify bot-signature-category [name]  
options:  
type [benign | malicious]

**DISPLAY**  
list bot-signature-category

**DELETE**  
delete bot-signature-category [name]

**DESCRIPTION**  
You can use the bot-signature-category component to create, modify, display, or delete a Bot Signature Category.

**EXAMPLES**

```
create bot-signature my_signature_category
```

Creates a custom Bot Signature Category named my\_signature\_category with initial settings.

```
list bot-signature-category
```

Displays the properties of all Bot Signature Categories.

#### OPTIONS

type Specifies the bot signature type. The possible values are benign or malicious.

#### SEE ALSO

edit, list, modify, security, security dos, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## security dos bot-signature

#### NAME

bot-signature - Configures the Bot Signatures.

#### MODULE

security dos

#### SYNTAX

Configure the bot-signature component within the security dos module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create bot-signature [string]
modify bot-signature [name]
options:
  category [name]
  domains [none | add | delete | replace-all-with] { [string] ... }
  risk [high | low | medium]
  rule [string]
  signature-references [string]
  url {
    match-type [contains | regexp]
    search-string [string]
  }
  user-agent {
    match-type [contains | regexp]
    search-string [string]
  }
```

##### DISPLAY

```
list bot-signature
```

##### DELETE

```
delete bot-signature [name]
```

#### DESCRIPTION

You can use the bot-signature component to create, modify, display, or delete a Bot Signature.

#### EXAMPLES

```
create bot-signature my_signature
```

Creates a custom Bot Signature named my\_signature with initial settings.

```
list bot-signature
```

Displays the properties of all Bot Signatures.

#### OPTIONS

category Specifies the bot signature category.

domains Specifies the bot signature domain names.

risk Specifies the bot signature risk. The possible values are high, low and medium.

rule Specifies the bot signature rule.

signature-references Specifies the bot signature references.

url Specifies the bot signature's url matching rule. The following options are available:

match-type

Specifies the bot signature's url rule match type. The possible values are contains or regexp.

search-string

Specifies the bot signature's url string that should be matched.

user-agent

Specifies the bot signature's user-agent matching rule. The following options are available:

match-type

Specifies the bot signature's user-agent rule match type. The possible values are contains or regexp.

search-string

Specifies the bot signature's user-agent string that should be matched.

SEE ALSO

edit, list, modify, security, security dos, tmsh

```

reset-stats device-config

#### DISPLAY

```
list device-config dos-device-config
show running-config device-config dos-device-config
options:
  all-properties
  dos-device-vector
  log-publisher
```

show device-config dos-device-config

#### RUN

```
run device-config dos-device-config auto-threshold-relearn
```

#### DESCRIPTION

This component is used to modify or display the global device DoS profile and statistics for use with network DoS Protection functionality.

#### EXAMPLES

```
modify device-config ...
```

Modifies the global DoS profile settings.

```
list device-config
```

Displays all the properties of the device DoS profile.

```
run device-config dos-device-config auto-threshold-relearn
```

Clears the auto-threshold history for all the device auto-threshold vectors.

#### OPTIONS

**dos-device-vector**

Configures attack detection thresholds and rate limit parameters for network DoS vectors.

**enforce**

Enable or disable the packet drop action of DOS detection for this attack type.

**log-publisher**

Specifies the name of the log publisher which logs translation events. See help sys log-config for more details on the logging sub-system.

**threshold-sensitivity**

Specifies the guidance on how aggressively (how much to pad) to adjust the "Detection/Rate-limit Threshold". Available settings are low, medium and high. This setting is used for Autodos and Behavioral DoS features. Default is set to medium.

**dynamic-signatures**

Specifies options related to L4 Behavioral DoS (Dynamic Signatures) feature that is applicable at the global/device level. These settings are used to learn the characteristic of the traffic at the device level (across all domains and virtual servers) and generate dynamic signatures as applicable to detect and mitigate anomalous traffic.

Following options are configurable for this feature at global/device level:

**detection**

Specifies the mode for detection of anomalies in traffic for the purpose of dynamic signature generation. Following modes are supported: disabled, enabled and learn-only.

Mode learn-only is same as enabled except that the system does not generate any logs (or alerts the user). It is used mainly to learn the baseline thresholds for the traffic.

Default is learn-only.

**mitigation**

Specifies the mode for mitigation of anomalous traffic (specified in form of dynamic signatures). Following modes are supported: none, low, medium and high.

Each mode represents the severity (or aggressiveness) at which the system should try to mitigate the anomalous traffic.

Default is none.

**scrubber-enable**

Specifies the configuration mode for enabling or disabling the feature to scrub the attack traffic upon dynamic signature match. Default is no.

**scrubber-category**

Specifies the IP Intelligence category used for scrubbing the attack traffic upon dynamic signature match that constitutes destination IP address component. Default category is attacked\_ips.

scrubber-advertisement-period  
Specifies the advertisement period for which the attack traffic is scrubbed. Default is 300 seconds.

#### VECTOR TYPES

arp-flood  
ARP Flood.

bad-ext-hdr-order  
IPv6 extension headers in packet are out of order.

bad-icmp-chksum  
Bad ICMP checksum.

bad-icmp-frame  
Bad ICMP frames. To see the various reasons why ICMP frames are classified as bad, please refer to the written documentation.

bad-igmp-frame  
Bad IGMP frames. To see the various reasons why IGMP frames are classified as bad, please refer to the written documentation.

bad-ip-opt  
IPv4 option with illegal length.

bad-ipv6-hop-cnt  
Bad IPv6 hop count. Terminated packet (cnt==0). Dropped when the rate hits rate limit.

bad-ipv6-ver  
Bad IPv6 version. IP Version in the IPV6 packet is not 6.

bad-sctp-chksum  
Bad SCTP Checksum type.

bad-tcp-chksum  
Bad TCP checksum.

bad-tcp-flags-all-clr  
Bad TCP flags (all TCP header flags cleared).

bad-tcp-flags-all-set  
Bad TCP flags (all flags set).

bad-ttl-val  
Bad IP TTL value (TTL == 0 for IPv4).

bad-udp-chksum  
Bad UDP checksum.

bad-udp-hdr  
Bad UDP header. To see the various reasons why UDP headers are classified as bad, please refer to the written documentation.

bad-ver  
Bad IP version 4. IPv4 version in IP header is not 4.

dns-any-query  
DNS any query packet.

dns-a-query  
DNS A query packet.

dns-ptr-query  
DNS PTR query packet.

dns-ns-query  
DNS NS query packet.

dns-soa-query  
DNS SOA query packet.

dns-cname-query  
DNS CNAME query packet.

dns-mx-query  
DNS MX query packet.

dns-aaaa-query  
DNS AAAA query packet.

dns-txt-query  
DNS TXT query packet.

dns-srv-query  
DNS SRV query packet.

dns-axfr-query  
DNS AXFR query packet.

dns-ixfr-query  
DNS IXFR query packet.

dns-malformed  
DNS Malformed packet.

dns-other-query  
DNS OTHER query packet.

dns-oversize  
DNS packet with size > . This sys db tunable is configurable with Dos.MaxDNSframeSize.

dup-ext-hdr

Duplicate IPv6 extension headers.

ether-brdcst-pkt  
Ethernet broadcast packet.

ether-mac-sa-eq-da  
Ethernet MAC SA == DA.

ether-multicast-pkt  
Ethernet multicast packet.

ext-hdr-too-large  
IPv6 extension header size too large. The max IPv6 extension header size is configurable via the sys db variable dos.maxip6extsize.

fin-only-set  
TCP header with only the FIN flag set.

flood  
A Flood is an attack where multiple (typically many) endpoints initiate network traffic to a single subnet or receiving endpoint.

hdr-len-gt-l2-len  
Header length > L2 length. No room in L2 packet for IPv4 header (including options).

hdr-len-too-short  
Header length too short. IPv4 header length in IP header is less than 20 bytes.

hop-cnt-leg-one  
IPv6 hop count <= 1 and the packet needs to be forwarded. This sys db tunable is configurable by the sys db variable tm.minipv6hopcnt.

host-unreachable  
ICMP packets of type "Host Unreachable".

icmp-frag-flood  
ICMP fragments flood.

icmp-frame-too-large  
Packets larger than the maximum ICMP frame size. The max ICMP frame size is configurable via the sys db variable dos.maxicmpframesize.

icmpv4-flood  
ICMPv4 Flood.

icmpv6-flood  
ICMPv6 Flood.

igmp-flood  
IGMP Flood.

igmp-frag-flood  
IGMP Fragment Flood.

ip-bad-src  
IP addr is a broadcast or multicast address.

ip-err-chksum  
IP error checksum. IPv4 header checksum error.

ip-frag-flood  
IPv4 fragment flood.

ip-len-gt-l2-len  
IP length > L2 length. Total length in IPv4 header is greater than the L3 part length in L2 packet.

ip-overlap-frag  
IPv4 overlapping fragments.

ip-short-frag  
IPv4 fragments whose payload size is less than the minimum IPv4 Fragment size. The minimum size is configurable via the db variable tm.minipfragsize.

ip-unk-prot  
IP Unknown Protocol type.

ip-opt-frames  
IP option frames. IPv4 packets with options. db variable tm.acceptipoptions must be enabled to receive IP options.

ip-other-frag  
The total IPv4 fragments' size has exceeded the reassembly queue or the maximum IP packet size.

ipv6-atomic-frag  
IPv6 frame with frag extension hdr, but the MF and offset fields are both 0.

ipv6-bad-src  
IPv6 src address is a multicast address or IPv6 src or dst addr is a IPv4 mapped IPv6 address.

ipv6-ext-hdr-frames  
IPv6 extended header frames.

ipv6-frag-flood  
IPv6 fragment flood.

ipv6-len-gt-l2-len  
IPv6 length > L2 length.

ipv6-other-frag  
The total IPv6 fragments' size has exceeded the reassembly queue or the maximum IP packet size.

ipv6-overlap-frag  
IPv6 overlapping fragments.

ipv6-short-frag  
IPv6 fragments whose payload size is less than the minimum IPv6 Fragment size. The minimum size is configurable via the db variable tm.minipv6fragsize.

ipv4-mapped-ipv6  
IPv4 mapped IPv6 addresses.

land-attack  
Land Attack. IP Src Address equals IP Dst Address. Both V4 and V6 are counted.

l2-len-ggt-ip-len  
L2 length >> IP length. L2 packet length is much greater than payload length in IPv4 (L2 length > IP length and L2 length > minimum packet size).

l4-ext-hdrs-go-end  
No L4 (extended headers go to or past the end of frame).

no-l4  
No L4. No L4 payload for IPv4.

opt-present-with-illegal-len  
TCP Option present with illegal length.

payload-len-ls-l2-len  
Payload length < L2 length. Payload length in IPv6 header is less than L3 part length in L2 packet.

routing-header-type-0  
Routing header type 0 present.

sip-malformed  
SIP malformed packet

sip-invite-method  
SIP INVITE method packet.

sip-ack-method  
SIP ACK method packet.

sip-options-method  
SIP OPTIONS method packet.

sip-bye-method  
SIP BYE method packet.

sip-cancel-method  
SIP CANCEL method packet.

sip-register-method  
SIP REGISTER method packet.

sip-publish-method  
SIP PUBLISH method packet.

sip-notify-method  
SIP NOTIFY method packet.

sip-subscribe-method  
SIP SUBSCRIBE method packet.

sip-message-method  
SIP MESSAGE method packet.

sip-prack-method  
SIP PRACK method packet.

sip-uri-limit  
Limit SIP URI length.

sip-other-method  
SIP OTHER method packet.

sweep  
A Sweep is an attack where a single endpoint initiates network traffic to a large number of receiving endpoints or subnets.

syn-and-fin-set  
SYN && FIN set.

tcp-ack-flood  
TCP packets with the ACK flag set (for non-existing flows).

tcp-bad-urg  
TCP packets with the URG flag set but URG pointer is 0.

tcp-hdr-len-gt-l2-len  
TCP header length > L2 length. No room in packet for TCP header (including options).

tcp-hdr-len-too-short

TCP header length too short (length < 5). The offset field in TCP header is less than 20 bytes.

tcp-opt-overruns-tcp-hdr  
TCP option overruns TCP header.

tcp-syn-flood  
TCP header with only the SYN flag set.

tcp-synack-flood  
TCP header with only the SYN and ACK flags set.

tcp-rst-flood  
TCP header with only the RST flag set.

tcp-psh-flood  
TCP header with PUSH flag set.

tcp-window-size  
TCP non-RST pkt with window size < . This sys db tunable is configurable with Dos.TcpLowWindowSize.

tidcmp  
ICMP source quench packets.

too-many-ext-hdrs  
Too many extended headers. The IPv6 extended headers are more than 4. This number can be set through db variable dos.maxipv6exthdrs.

tcp-syn-oversize  
TCP data-SYN with pktlength > dos.maxsynsize which is 128 bytes by default.

ttl-leq-one  
TTL <= . For IPv4 forwarding. This sys db tunable is configurable by tm.minipttl.

unk-tcp-opt-type  
Unknown TCP option type.

udp-flood  
UDP Flood.UDP flood vector counts any UDP packets that either match the UDP Port InclusionList or do not match the UDP Port ExclusionList. "tms modify security dos udp-portlist" can be used to configure the udp port list.For more info about udp portlist and how to configure it use "help security dos udp-portlist"

unk-ipopt-type  
Unknown IP option type.

#### PARAMETERS

default-internal-rate-limit  
This parameter is programmed in hardware to limit the traffic to BIG-IP software. If the hardware DoS support does not exist software uses default-internal-rate-limit to limit the good traffic (most of them are flood) to external servers. Bad packets are always dropped.

If the rate limit value is infinite the rate limit is disabled.

detection-threshold-percent  
This parameter specifies relative threshold that uses dynamically learned 1-hour average rate to detect attacks. If the current rate (1-minute average) increases the specified percent over the 1-hour average rate, attack is detected.

If the threshold value is infinite the detection is disabled.

detection-threshold-pps  
This parameter specifies absolute threshold value. If the current rate (1-minute average) is equal or above the threshold value, attack is detected.

If the threshold value is infinite the detection is disabled.

packet-types  
This parameter is used to specify type of packets that will be classified as Sweep/Flood attacks. There are various types of packet types that can be specified.

auto-threshold  
Enables the auto mode for dos detection and dos mitigation

simulate-auto-threshold  
Option to enable/disable auto-threshold simulation by generating logs if auto-threshold based detection/mitigation would have kicked in. Only valid in manual mode.

floor  
Option to set a minimum value ("floor") for the detection-threshold-pps for this vector. The range is from 0 (no-floor) to infinity (no-detection).

ceiling  
Option to set a maximum value ("ceiling") for the default-internal-rate-Limit for this vector. The range is from 0 to infinity.

auto-blacklisting  
Enables automatic blacklisting of offending IPs

blacklist-detection-seconds  
Duration in seconds for which the IP has been offending.

`blacklist-duration`  
Duration in seconds for which this IP should be blocked.

`blacklist-category`  
Blacklist category (of IP intelligence) to which this IP should be added.

`bad-actor`  
Enables per-source IP based bad actor detection

`per-source-ip-detection-pps`  
Bad actor detection rate (for single IP address) of this vector

`per-source-ip-limit-pps`  
Bad actor allowed rate (for single IP address) of this vector

## security dos dynamic-signatures

NAME

`dynamic-signatures` - Configures the dynamic signature(s) generated by L4 BDoS (or Dynamic Signature) AFM feature based on traffic characterization and anomaly detection.

MODULE

`security dos`

SYNTAX

Configure the `dynamic-signatures` component within the `security dos` module using the syntax shown in the following sections.

CREATE

Currently this option is not supported for dynamic signatures.

MODIFY

```
modify dynamic-signatures [name]
options:
  context-name [name]
  detection-threshold [integer]
  dynamic-vectors
  enforce [disabled | enabled]
  mitigation-threshold [integer]
  partition [name]
  status [disabled | enabled]
```

DISPLAY

```
list dynamic-signatures
```

DELETE

Currently this option is not supported for dynamic signatures.

DESCRIPTION

You can use the `dynamic-signatures` component to modify or display a dynamic signature.

EXAMPLES

```
modify dynamic-signatures Sig_Device_ToS status disabled
```

This example shows how to disable a dynamic signature named `Sig_Device_ToS`

```
modify dynamic-signatures Sig_Device_TTL detection-threshold 10000
mitigation-threshold 4294967295
```

This examples show how to modify the detection and mitigation threshold of a dynamic signature named `Sig_Device_TTL`

OPTIONS

`context-name`  
Specifies the context for which the dynamic signature has been generated. This is a read-only field and possible values are 'Device' or 'Virtual server Name'.

`detection-threshold`  
Specifies the threshold value above which the traffic is declared as 'anomalous' (or an attack). When the system generates a dynamic

signature (based on traffic anomaly characterization), it assigns a value for detection threshold (based on various factors such as sensitivity, anomaly percent, confidence level etc.)

User can override this value by modifying the signature and specify a new value to be used for detection mechanism.

#### dynamic-vectors

Specifies the list of metrics and the corresponding values/ranges that constitutes a dynamic signature. This is a read-only field.

#### enforce

Specifies the run time behavior of the dynamic signature in the datapath with respect to enforcement. Possible values are: disabled or enabled.

If set to disabled, the system does not enforce the signature to rate limit traffic but only collect statistics. If set to enabled, in addition to collecting stats, system also enforces the signature to detect an attack and limit traffic as per the mitigation threshold.

#### mitigation-threshold

Specifies the threshold above which the system rate limits (drops) the traffic that matches this generated dynamic signature. When the system generates a dynamic signature, it assigns a value for mitigation threshold based on certain factors such as mitigation configuration, detection threshold etc.

User can override this value by modifying the signature and specify a new value to be used for mitigating traffic that matches this dynamic signature.

#### status

Specifies the run time status of the generated signature. Possible values are: disabled or enabled.

By default, the status is set to enabled when the system generates a dynamic signature. User can disable detection and mitigation for this dynamic signature by setting this field to disabled.

## security dos network-whitelist

#### NAME

network-whitelist - Configures the DoS network whitelist component within the security dos module using the syntax shown in the following sections. These DoS network whitelist entries are applied to all packets except those going through the management interface.

#### MODULE

security dos

#### SYNTAX

##### MODIFY

```
modify network-whitelist dos-network-whitelist
options:
  address-list
  description [string]
  entries [add | delete | modify | replace-all-with] {
    [ [name] ] {
      options:
      description [string]
      destination {
        address [ip_address/prefixlen]
        port [port]
      }
    }
  }
ip-protocol [any | icmp | igmp | tcp | udp]
source {
  address [ip_address/prefixlen] ]
  vlans [vlan name | vlanid/mask]
}
}
```

##### DISPLAY

```
list network-whitelist
```

## DESCRIPTION

You can use the network-whitelist component to configure a DoS network whitelist of upto eight entries for all traffic except the management interface. Along with that you can use address-list to configure the srcIP Global whitelist. To this address-list you need to attach the address list objects. This address-list can be a nested list of fully qualified address. Subnets and IP address ranges and geo-locations are not allowed.. The HSB hardware compares all incoming traffic to the network-whitelist entries. If a match is found then it does not do DoS vector checks for those packets. If a match is not found then DoS vector checks are done on those packets. The network software does its regular DoS vector checks on the incoming packets as usual. If a DoS vector is hit then it compares that packet with the DoS network-whitelist entries. If the packet matches an entry, then the system does not increment the DoS vector that matched. If the packets does not match a DoS network-whitelist entry then the matched DoS vector is incremented and appropriate action is taken.

If an entry specifies more than one of the above items, a packet must pass all of the items to successfully match. For example, if an entry specifies a source subnet and a destination port, a packet must originate from the given subnet and must also have the specified destination port.

Either destination ip\_address/prefixlen or source ip\_address/prefixlen can be specified in a network-whitelist entry. An ip\_address/prefixlen for both source and destination cannot be specified for an entry.

## EXAMPLES

```
modify network-whitelist dos-network-whitelist description "bad
interfaces" entries add { re_telnet { ip-protocol tcp destination {
port telnet } } }
```

Creates a new entry called re\_telnet. It matches any TCP packet whose destination port is telnet.

```
modify network-whitelist dos-network-whitelist entries add { internal-
net { source { address 172.27.0.0/16 } } }
```

Creates an entry that matches traffic from the 172.27.0.0 network.

```
list network-whitelist
security dos network-whitelist dos-network-whitelist {
  entries {
    re_telnet {
      ip-protocol tcp
      destination {
        port telnet
      }
    }
    internal-net {
      source {
        address 172.27.0.0/16
      }
    }
  }
}
```

Displays the current list of DoS whitelist entries.

```
modify network-whitelist dos-network-whitelist entries delete {
internal-net }
```

Removes the "internal-net" entry from the list of network-whitelist entries.

## OPTIONS

**description**  
Your description for the DoS network-whitelist entries.

**entries**  
Adds, deletes, or replaces a network-whitelist entry.

**add** Creates a new entry, which you specify next with a unique string in curly braces ({}).

**delete**  
Deletes the entry that you specify next, in curly braces ({}). You can use delete {all} to empty the list of network-whitelist entries, which has the same effect as using none (see below).

**modify**  
Modifies the existing entry that you specify next, in curly braces ({}). After the entry name, enter the new configuration settings for the entry inside a nested set of curly braces.

**replace-all-with**  
Replaces the current set of network-whitelist entries with the entry(s) that you specify next, in curly braces ({}).

**none** Empties the list of network-whitelist entries.

Enter the name of a entry to be added or modified, then enter an open curly brace {}, one or more of the following options, and a closed curly brace {}.

**description**  
Your description for the current entry.

**destination**  
Matches against each packet's destination IP and/or destination port.

#### address

Specifies an IP address and network to compare against the packet's destination address.

The format for an IPv4 address is a.b.c.d[/prefix]. The general format for an IPv6 address is a:b:c:d:e:f:g:h[/prefix]; you can shorten this by eliminating leading zeros from each field (for example, you can shorten "2001:0db7:3f4a:09dd:ca90:ff00:0042:8329" to "2001:db7:3f4a:9dd:ca90:ff00:42:8329"), and/or by removing the longest contiguous field of zeros (for example, you can shorten "2001:0:0:0:c34a:0:23ff:678" to "2001::c34a:0:23ff:678"). TMSH accepts any valid text representation of IPv6 addresses, as defined in RFC 2373 (see ).

**port** Specifies a port to compare against the packet's destination port.

#### ip-protocol

Specifies the IP protocol to compare against the packet. This could be any, icmp, igmp, tcp or udp. If you specify this option, a packet only matches if it uses the chosen protocol.

#### source

Matches against each packet's source IP, and/or source VLANs.

#### address

Specifies an IP address and network to compare against the packet's source address.

The format for an IPv4 address is a.b.c.d. The general format for an IPv6 address is a:b:c:d:e:f:g:h.

#### vlan

Specifies either a vlan name or a range of vlanids to compare against the packet. The range is specified as vlanid/mask. For example if you specify "3200/8" then the vlanid range will be 3200-3207.

#### EXAMPLES

```
modify security dos network-whitelist dos-network-whitelist address-list [name]
```

It adds list1 objects to the global address-list. For configuring the address list objects (list1) you can use the following examples:

```
list security firewall address-list list1
```

```
security firewall address-list list1 {  
  addresses {  
    30.30.30.30 { }  
    45:56:567:234:456:: { }  
  }  
}
```

This is how you can list the address-list objects that you configured for global whitelists list security dos network-whitelist address-list security dos network-whitelist dos-network-whitelist { address-list list1 }

#### DELETE

```
delete profile [name]
```

#### DESCRIPTION

You can use the profile component to create, modify, display, or delete a DoS profile for use with DoS Protection functionality.

#### EXAMPLES

```
create profile my_dos_profile
```

Creates a custom DoS profile named my\_dos\_profile with initial settings.

```
list profile
```

Displays the properties of all DoS profiles.

#### OPTIONS

```
app-service
Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.
```

**application**  
Adds, deletes, or replaces a single Application Security sub-profile. You can configure the following options for Application Security:

**bot-defense**  
Specifies properties of proactive bot defense in Application Security. You can configure the following options for Proactive Bot Defense:

**collect-stats**  
Enables or disables domain statistics collection.

**cross-domain-requests**  
Specifies a cross-domain requests handling mode. The options are:

**allow-all**  
Allows all cross-domain requests. This is the default value.

**validate-bulk**  
System validates domains in bulk: the cookies for the related domains are created together with the cookie for the current domain, by generating challenges in iframes - one per each domain.

**validate-upon-request**  
System validates domains upon request: the cookie for the related domain is generated when a request arrives to an unqualified URL without a cookie.

**external-domains**  
Configures a list of external domains that are allowed to link to resources of this website.

**grace-period**  
Specifies the length of grace period (in seconds) in which only the Simple Bot Prevention is enforced.

**mode** Specifies a mode of proactive bot defense. The options are:

**always**  
Specifies that the proactive bot defense is always enabled.

**disabled**  
Specifies that the proactive bot defense is disabled. This is the default value.

**during-attacks**  
Specifies that the proactive bot defense is enabled only during attacks.

**site-domains**  
Configures a list of domains that are part of the website.

**url-whitelist**  
Configures a list of URLs to exclude from the proactive bot defense.

**browser-legit-enabled**  
Enables or disables the proactive bot defense validation of browser legitimacy and blocking of requests from suspicious clients.

**browser-legit-captcha**  
Enables or disables the browser legitimacy detection improvement using CAPTCHA. In order to enable it, you must first enable browser-legit-enabled.

**bot-signatures**  
Specifies settings of Bot Signatures in Application Security. You can configure the following options for Bot Signatures:

**categories**  
Specifies the action for each Bot Signature Category. You can configure the following options for each Bot Signature Category:

**action**  
Specifies the action for the Bot Signature Category. The possible actions are none, block and report.

**check**  
Enables or disables the checking of Bot Signature, allowing bots to be detected.

**disabled-categories**  
Configures a list of disabled Bot Signatures.

**captcha-response**  
Specifies properties of the CAPTCHA response in Application Security. You can configure the following options for CAPTCHA Response Settings:

**failure**  
Specifies properties of a failed CAPTCHA response. You can configure the following options for a failed CAPTCHA response:

body Configures a failed CAPTCHA response body.

type Configures a type of a failed CAPTCHA response body. You can configure the following options for a failed CAPTCHA response type:

custom  
Configures a custom failed CAPTCHA response type.

default  
Configures a default failed CAPTCHA response type.

first  
Specifies properties of the first CAPTCHA response. You can configure the following options for the first CAPTCHA response:

body Configures the first CAPTCHA response body.

type Configures a type of the first CAPTCHA response body. You can configure the following options for the first CAPTCHA response type:

custom  
Configures a custom first CAPTCHA response type.

default  
Configures a default first CAPTCHA response type.

geolocations  
Configures a list of blacklisted/whitelisted Geolocations. You can configure the following options for each Geolocation:

[black-listed | white-listed]  
Specifies a type of Geolocation.

heavy-urls  
Specifies heavy URL protection in Application Security. You can configure the following options for heavy URL protection:

automatic-detection  
Enables or disables automatic heavy URL detection. In order to enable it, you must first enable protection.

exclude  
Configures a list of URLs (or wildcards) to exclude from the heavy URLs.

include  
(Deprecated, use include-list) Configures a list of URLs to include in the heavy URLs.

include-list  
Configures a list of URLs to include in the heavy URLs.

latency-threshold  
Specifies the latency threshold for automatic heavy URL detection (in milliseconds).

protection  
(Deprecated, use stress/tps.url-enable-heavy) Enables or disables heavy URL protection. To enable it, you must additionally enable one of the following DoS URL-based prevention policy methods: url-client-side-defense or url-rate-limiting. This can be done for either tps-based or stress-based anomaly protection.

ip-whitelist  
Attribute ip-whitelist is deprecated in version 13.0.0; consider using http-whitelist instead. Adds, deletes, or replaces a set of IP addresses and subnets in the whitelist of Application Security.

name Specifies a dummy name for enabled Application Security. This option is required for the operations create, delete, modify, and replace-all-with.

stress-based  
Specifies Stress-based anomaly in Application Security. You can configure the following options for Stress-based anomaly:

de-escalation-period  
Specifies the de-escalation period (in seconds) in Stress-based anomaly.

escalation-period  
Specifies the escalation period (in seconds) in Stress-based anomaly.

geo-captcha-challenge  
Enables or disables Geolocation-based CAPTCHA challenge in Stress-based anomaly.

geo-client-side-defense  
Enables or disables Geolocation-based client side integrity defense in Stress-based anomaly.

geo-minimum-share  
Specifies the minimum traffic share for detection in

Geolocation detection criteria of Stress-based anomaly.

geo-rate-limiting

Enables or disables Geolocation-based rate limiting in Stress-based anomaly.

geo-request-blocking-mode

Specifies a Geolocation-based request blocking mode of Stress-based anomaly. The options are:

block-all

Specifies that the system blocks all requests from the respective Geolocation.

rate-limit

Specifies that the system blocks requests from the respective Geolocation based on the traffic share ratio. This is the default value.

geo-share-increase-rate

Specifies the percentage by which TPS increased in Geolocation detection criteria of Stress-based anomaly.

ip-captcha-challenge

Enables or disables Source IP-based CAPTCHA challenge in Stress-based anomaly.

ip-client-side-defense

Enables or disables Source IP-based client side integrity defense in Stress-based anomaly.

ip-maximum-tps

Specifies the amount which TPS reached in IP detection criteria of Stress-based anomaly.

ip-minimum-tps

Specifies the minimum TPS threshold for detection in IP detection criteria of Stress-based anomaly.

ip-rate-limiting

Enables or disables Source IP-based rate limiting in Stress-based anomaly.

ip-request-blocking-mode

Specifies a Source IP-based request blocking mode of Stress-based anomaly. The options are:

block-all

Specifies that the system blocks all requests from the respective Source IP address.

rate-limit

Specifies that the system blocks requests from the respective Source IP address based on the traffic share ratio. This is the default value.

ip-tps-increase-rate

Specifies the percentage by which TPS increased in IP detection criteria of Stress-based anomaly.

mode Specifies an operation mode of Stress-based anomaly. The options are:

off Specifies that the system does not check for DoS attacks. This is the default value.

transparent

Specifies that when the system detects an attack, it displays the attack data on the Reporting DoS Attacks screen. In transparent mode the system does not drop requests either from the attacking IP address, or to attacked URLs.

blocking

Specifies that when the system detects an attack, in addition to displaying the attack data on the Reporting DoS Attacks screen, the system also drops either connections from the attacking IP address, or requests to attacked URLs.

site-captcha-challenge

Enables or disables Site-wide CAPTCHA challenge in Stress-based anomaly.

site-client-side-defense

Enables or disables Site-wide client side integrity defense in Stress-based anomaly.

site-maximum-tps

Specifies the amount which TPS reached in Site-wide detection criteria of Stress-based anomaly.

site-minimum-tps

Specifies the minimum TPS threshold for detection in Site-wide detection criteria of Stress-based anomaly.

site-rate-limiting

Enables or disables Site-wide rate limiting in Stress-based anomaly.

site-tps-increase-rate

Specifies the percentage by which TPS increased in Site-wide detection criteria of Stress-based anomaly.

**static-url-mitigation**  
Enables or disables Static URL mitigation in Stress-based anomaly.

**url-captcha-challenge**  
Enables or disables URL-based CAPTCHA challenge in Stress-based anomaly.

**url-client-side-defense**  
Enables or disables URL-based client side integrity defense in Stress-based anomaly.

**url-maximum-tps**  
Specifies the amount which TPS reached in URL detection criteria of Stress-based anomaly.

**url-minimum-tps**  
Specifies the minimum TPS threshold for detection in URL detection criteria of Stress-based anomaly.

**url-rate-limiting**  
Enables or disables URL-based rate limiting in Stress-based anomaly.

**url-tps-increase-rate**  
Specifies the percentage by which TPS increased in URL detection criteria of Stress-based anomaly.

**behavioral**  
Specifies properties of Behavioral Detection in Stress-based anomaly. You can configure the following options for Behavioral Detection:

- dos-detection**  
Enables or disables the Behavior Based Detection.
- slowdown-incoming-requests**  
Enables or disables the slowdown of incoming requests from the detected suspicious clients. In order to enable it, you must first enable dos-detection and anomaly-detection.
- rate-limit-incoming-requests**  
Enables or disables the rate limit of incoming requests from the detected suspicious clients. In order to enable it, you must first enable dos-detection.
- connection-limit-requests**  
Enables or disables the connection limit of incoming requests from the detected suspicious clients. In order to enable it, you must first enable dos-detection.
- traffic-burst-protection**  
Enables or disables the mitigation even before detecting a severe server health, in proportion to the detected server health. In order to enable it, you must first enable dos-detection.
- mitigation-mode**  
Increase a mitigation impact according to selected mitigation methods.

**tcp-dump**  
Specifies properties of traffic recording during attacks in Application Security. You can configure the following options for Record Traffic During Attacks:

- maximum-duration**  
Specifies the TCP dump maximum duration (in seconds).
- maximum-size**  
Specifies the TCP dump maximum size (in megabytes).
- record-traffic**  
Enables or disables traffic recording during attacks.
- repetition-interval**  
Specifies the TCP dump repetition interval (in seconds).

**tps-based**  
Specifies TPS-based anomaly in Application Security. You can configure the following options for TPS-based anomaly:

- de-escalation-period**  
Specifies the de-escalation period (in seconds) in TPS-based anomaly.
- escalation-period**  
Specifies the escalation period (in seconds) in TPS-based anomaly.
- geo-captcha-challenge**  
Enables or disables Geolocation-based CAPTCHA challenge in TPS-based anomaly.
- geo-client-side-defense**  
Enables or disables Geolocation-based client side integrity defense in TPS-based anomaly.
- geo-minimum-share**  
Specifies the minimum traffic share for detection in Geolocation detection criteria of TPS-based anomaly.

geo-rate-limiting  
Enables or disables Geolocation-based rate limiting in TPS-based anomaly.

geo-request-blocking-mode  
Specifies a Geolocation-based request blocking mode of TPS-based anomaly. The options are:

- block-all  
Specifies that the system blocks all requests from the respective Geolocation.
- rate-limit  
Specifies that the system blocks requests from the respective Geolocation based on the traffic share ratio. This is the default value.

geo-share-increase-rate  
Specifies the percentage by which TPS increased in Geolocation detection criteria of TPS-based anomaly.

ip-captcha-challenge  
Enables or disables Source IP-based CAPTCHA challenge in TPS-based anomaly.

ip-client-side-defense  
Enables or disables Source IP-based client side integrity defense in TPS-based anomaly.

ip-maximum-tps  
Specifies the amount which TPS reached in IP detection criteria of TPS-based anomaly.

ip-minimum-tps  
Specifies the minimum TPS threshold for detection in IP detection criteria of TPS-based anomaly.

ip-rate-limiting  
Enables or disables Source IP-based rate limiting in TPS-based anomaly.

ip-request-blocking-mode  
Specifies a Source IP-based request blocking mode of TPS-based anomaly. The options are:

- block-all  
Specifies that the system blocks all requests from the respective Source IP address.
- rate-limit  
Specifies that the system blocks requests from the respective Source IP address based on the traffic share ratio. This is the default value.

ip-tps-increase-rate  
Specifies the percentage by which TPS increased in IP detection criteria of TPS-based anomaly.

mode Specifies an operation mode of TPS-based anomaly. The options are:

- off Specifies that the system does not check for DoS attacks. This is the default value.
- transparent  
Specifies that when the system detects an attack, it displays the attack data on the Reporting DoS Attacks screen. In transparent mode the system does not drop requests either from the attacking IP address, or to attacked URLs.
- blocking  
Specifies that when the system detects an attack, in addition to displaying the attack data on the Reporting DoS Attacks screen, the system also drops either connections from the attacking IP address, or requests to attacked URLs.

site-captcha-challenge  
Enables or disables Site-wide CAPTCHA challenge in TPS-based anomaly.

site-client-side-defense  
Enables or disables Site-wide client side integrity defense in TPS-based anomaly.

site-maximum-tps  
Specifies the amount which TPS reached in Site-wide detection criteria of TPS-based anomaly.

site-minimum-tps  
Specifies the minimum TPS threshold for detection in Site-wide detection criteria of TPS-based anomaly.

site-rate-limiting  
Enables or disables Site-wide rate limiting in TPS-based anomaly.

site-tps-increase-rate  
Specifies the percentage by which TPS increased in Site-wide detection criteria of TPS-based anomaly.

static-url-mitigation

Enables or disables Static URL mitigation in TPS-based anomaly.

url-captcha-challenge  
Enables or disables URL-based CAPTCHA challenge in TPS-based anomaly.

url-client-side-defense  
Enables or disables URL-based client side integrity defense in TPS-based anomaly.

url-maximum-tps  
Specifies the amount which TPS reached in URL detection criteria of TPS-based anomaly.

url-minimum-tps  
Specifies the minimum TPS threshold for detection in URL detection criteria of TPS-based anomaly.

url-rate-limiting  
Enables or disables URL-based rate limiting in TPS-based anomaly.

url-tps-increase-rate  
Specifies the percentage by which TPS increased in URL detection criteria of TPS-based anomaly.

trigger-irule  
Specifies, when enabled, that the system activates an Application DoS iRule event. The default value is disabled.

single-page-application  
Specifies, when enabled, that the system supports a Single Page Applications. The default value is disabled.

description  
User defined description.

protocol-dns  
Adds, deletes, or replaces a single Protocol DNS Security sub-profile. You can configure the following options for Protocol DNS Security:

name Specifies a dummy name for enabled Protocol DNS Security. This option is required for the operations create, delete, modify, and replace-all-with.

dns-query-vector  
Adds, deletes, or replaces Protocol DNS DoS vectors. You can configure the following options for DNS query vectors:

query-type  
Specifies the vector (DNS query) type for DoS attack detection.

enforce  
Enable or disable the packet drop action of DOS detection for this attack type.

bad-actor  
Enables per-source IP based bad actor detection

per-source-ip-detection-pps  
Bad actor detection rate (for single IP address) of this vector

per-source-ip-limit-pps  
Bad actor allowed rate (for single IP address) of this vector

rate-increase  
Specifies the rate increase for DoS attack detection.

rate-limit  
Specifies the rate limit for DoS attack detection.

rate-threshold  
Specifies the rate threshold for DoS attack detection.

prot-err-attack-detection  
Specifies if protocol errors attack detection is enabled or not. Eg: Malformed, Malicious DoS attacks.

prot-err-attack-rate-incr  
Specifies the protocol errors rate increase for DoS attack detection.

protocol-sip  
Adds, deletes, or replaces a single Protocol SIP Security sub-profile. You can configure the following options for Protocol SIP Security:

name Specifies a dummy name for enabled Protocol SIP Security. This option is required for the operations create, delete, modify, and replace-all-with.

prot-err-attack-rate-increase  
Specifies the protocol errors rate increase for DoS attack detection.

prot-err-attack-rate-threshold  
Specifies the protocol errors rate threshold for DoS attack detection.

#### prot-err-attack-detection

Specifies if protocol errors attack detection is enabled or not. Eg: Malformed packets DoS attacks.

#### sip-method-vector

Adds, deletes, or replaces Protocol SIP DoS vectors. You can configure the following options for SIP method vectors:

#### method-type

Specifies the vector type (SIP method) for DoS attack detection.

#### enforce

Enable or disable the packet drop action of DOS detection for this attack type.

#### bad-actor

Enables per-source IP based bad actor detection

#### per-source-ip-detection-pps

Bad actor detection rate (for single IP address) of this vector

#### per-source-ip-limit-pps

Bad actor allowed rate (for single IP address) of this vector

#### rate-increase

Specifies the rate increase for DoS attack detection.

#### rate-limit

Specifies the rate limit for DoS attack detection.

#### rate-threshold

Specifies the rate threshold for DoS attack detection.

#### dos-network

Adds, deletes, or replaces a single Network DoS Security sub-profile. You can configure the following options for Network DoS Security:

**name** Specifies a dummy name for enabled Network DoS Security.

This option is required for the operations create, delete, modify, and replace-all-with.

#### dynamic-signatures

Specifies options related to L4 Behavioral DoS (Dynamic Signatures) feature per virtual server by virtue of attaching a dos profile to a virtual server. Following options are configurable for this feature:

#### detection

Specifies the mode for detection of anomalies in traffic for the purpose of dynamic signature generation. Following modes are supported: disabled, enabled and learn-only.

Mode learn-only is same as enabled except that the system does not generate any logs (or alerts the user). It is used mainly to learn the baseline thresholds for the traffic.

Default is disabled.

#### mitigation

Specifies the mode for mitigation of anomalous traffic (specified in form of dynamic signatures). Following modes are supported: none, low, medium and high.

Each mode represents the severity (or aggressiveness) at which the system should try to mitigate the anomalous traffic.

Default is none.

#### scrubber-enable

Specifies the configuration mode for enabling or disabling the feature to scrub the attack traffic upon dynamic signature match. Default is no.

#### scrubber-category

Specifies the IP Intelligence category used for scrubbing the attack traffic upon dynamic signature match that constitutes destination IP address component. Default category is attacked\_ips.

#### scrubber-advertisement-period

Specifies the advertisement period for which the attack traffic is scrubbed. Default is 300 seconds.

#### network-attack-vector

Adds, deletes, or replaces Network Attack DoS vectors. You can configure the following options for Network Attack vectors:

#### attack-type

Specifies the vector type (Network Attack) for DoS attack detection.

#### enforce

Enable or disable the packet drop action of DOS detection for this attack type.

rate-increase  
Specifies the rate increase for DoS attack detection.

rate-limit  
Specifies the rate limit for DoS attack detection.

rate-threshold  
Specifies the rate threshold for DoS attack detection.

packet-types  
Specifies the packet types for Sweep attack vector.

bad-actor  
Enables per-source IP based bad actor detection

per-source-ip-detection-pps  
Bad actor detection rate (for single IP address) of this vector

per-source-ip-limit-pps  
Bad actor allowed rate (for single IP address) of this vector

whitelist  
Specifies the Dos srcIP whitelist configuration.

http-whitelist  
Specifies the IP addresses and subnets whitelist configuration for Application Security (Overrides the global whitelist).

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

partition  
Displays the administrative partition within which the component resides.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### SEE ALSO

create, delete, edit, glob, list, ltm virtual, modify, regex, security, security dos, show, tmsh

## security dos spva-stats

NAME  
spva-stats - Shows the Configuration and Data path stats for SPVA.

MODULE  
security dos

SYNTAX  
Displays the SPVA stats

DISPLAY  
show security dos spva-stats

DESCRIPTION  
This module shows the SPVA related configuration and data path stats. SPVA stats are relevant only in case the Hardware is SPVA capable.

#### EXAMPLES

show security dos spva-stats

Displays the below sPVA reslated stats

Total SW entry

Total sPVA entry count present in SW

Total HSB entry

Max number of sPVA entries in HSB

Used HSB entry

Total number of sPVA entries present in HSB

Global white list SW entry

Global whitelist entries present in SW

Global white list HSB entry

Global Whitelist entries present in HSB.

Global white list total entry

Total number of Global white list entries present in SW and HSB

Global black list SW entry

Total number of global back list sPVA entries present in SW

Global black list HSB entry

Total number of global black list sPVA entries present in HSB

Global black list total entry

Total number of global black list entry count present in SW and HSB

VS white list SW entry

Total whitelist SW entry count for virtual server with port as wildcard.

VS white list HSB entry

Total whitelist HSB entry count for virtual server with port as wildcard.

VS white list total entry

Total count of white list entries present in SW and HSB for virtual server with port as wildcard.

VS black list SW entry

Total black list SW entry count for virtual server with port as wildcard.

VS black list HSB entry

Total black list HSB entry count for virtual server with port as wildcard.

VS black list total entry

Total count of black list entries present in SW and HSB for virtual server with port as wildcard.

App white list SW entry

Total whitelist SW entry count for application virtual server.

App white list HSB entry

Total whitelist HSB entry count for application virtual server.

App white list total entry

Total count of white list entries present in SW and HSB for application virtual server

App black list SW entry

Total black list SW entry count for application virtual server

App black list HSB entry

Total black list HSB entry count for application virtual server.

App black list total entry

Total count of black list entries present in SW and HSB for application virtual server

Global white list SW hit

Total packets hits for global white list in SW

Global white list HSB hit

Total packets hits for global white list in HSB

Global white list total hit

Total packets hits for global white list in SW and HSB.

Global black list SW hit

Total packets hits for global black list in SW

Global black list HSB hit

Total packets hits for global black list in HSB

Global black list total hit

Total packets hits for global black list in SW and HSB.

VS white list SW hit

Total packet hits for white list in SW for virtual server with port as wildcard.

VS white list HSB hit

Total packet hits for white list in HSB for virtual server with port as wildcard.

VS white list total hit

Total packet hits for white list in SW and HSB for virtual server

with port as wildcard.

VS black list SW hit

## security dos udp-portlist

#### NAME

udp-portlist - Configures the DoS udp portlist component within the security dos module using the syntax shown in the following sections. These DoS udp portlist entries are applied to all udp packets except those going through the management interface.

#### MODULE

security dos

#### SYNTAX

```
MODIFY
modify udp-portlist dos-udp-portlist
options:
  description [string]
  list-type [exclude-listed-ports | include-listed-ports]
  entries [modify | replace-all-with] {
    [entry] {
      options:
      description [string]
      match-direction [both | dst | none | src]
      port-number [number]
```

```
}  
}
```

```
DISPLAY  
list udp-portlist
```

#### DESCRIPTION

You can use the `udp-portlist` component to configure a DoS UDP portlist of upto eight entries for all UDP traffic except the management interface. The HSB hardware compares all incoming UDP traffic to the `udp-portlist` entries. There are 2 types of behavior, depending upon whether the `udp` port list is configured as a white list or as a black list. White list and black list are mutually exclusive properties of a UDP port list.

If the `udp` port list is configured as a list-type of `exclude-listed-ports`, and if a match is found on an incoming packet, then we do not increment the UDP Flood DoS vector. If a match is not found, then the UDP Flood DoS vector checks are done on those packets.

If the `udp` port list is configured as a list-type of `include-listed-ports`, and if a match is found on an incoming packet, then we increment the UDP Flood DoS vector. If a match is not found, then the UDP Flood DoS vector checks are not done on the packets.

Either destination port or source port or both can be specified in a `udp-portlist` entry.

#### EXAMPLES

```
modify udp-portlist dos-udp-portlist description "bad ports" list-type  
include-listed-ports Modifies the udp-portlist dos-udp-portlist to a  
blacklist.
```

```
modify udp-portlist dos-udp-portlist list-type exclude-listed-ports  
Modifies the udp-portlist dos-udp-portlist to a white-list.
```

```
modify udp-portlist dos-udp-portlist description "bad ports" entries  
modify { entry1 { match-direction src port-number 161 } } Modifies an  
entry. The new entry is for source UDP port 161. It matches any UDP  
packet whose source port is 161.
```

```
modify udp-portlist dos-udp-portlist entries modify { 161 { match-  
direction both } }
```

Modifies the entry for destination UDP port 161 to source and destination port 161. It matches any UDP packet whose destination or source port is 161.

```
security dos udp-portlist dos-udp-portlist {  
  entries {  
    entry1 {  
      match-direction both  
      port-number snmp  
    }  
    entry2 { }  
    entry3 { }  
    entry4 { }  
  }  
  white-list  
}
```

Displays the current list of DoS UDP portlist entries.

#### OPTIONS

```
description  
Your description for the DoS udp-portlist.
```

```
list-type  
Sets the list type to be either exclude-listed-ports or include-  
listed-ports
```

```
include-listed-ports  
Sets the property of the dos-udp-portlist list to include-  
listed-ports (Blacklist).
```

```
exclude-listed-ports  
Sets the property of the dos-udp-portlist list to exclude-  
listed-ports (Whitelist).
```

```
entries  
Modifies a udp-portlist entry.
```

```
modify  
Modifies the existing entry that you specify next, in curly braces ({}). After the entry name, enter the new configuration (port mode and port number) settings for the entry inside a nested set of curly braces.
```

```
replace-all-with  
Replaces the current set of udp-portlist entries with the entry(s) that you specify next, in curly braces ({}).
```

Enter the name of an entry to be modified, then enter an open curly brace ({}), one or more of the following options, and a closed curly brace ({}).

```
description  
Your description for the current entry.
```

```
match-direction  
Set the mode of matching (source, destination or both).
```

```
port-number  
Set the port number for matching.
```

## security firewall address-list

**NAME**

address-list - Configures an address-list for use by firewall rules. An address list is a list of IP-address prefixes to compare against the source-IP address and/or destination-IP address in an IP packet.

**MODULE**

security firewall

**SYNTAX****CREATE/MODIFY**

```
create address-list [name]
modify address-list [[name] | all]
options:
  addresses [add | delete | modify | replace-all-with] {
    [ [ip address] ]
  }
  fqdns [add | delete | replace-all-with] {
    [ fully qualified domain names]
  }
  fqdns none
  geo [add | default | delete | replace-all-with] {
    [ [country_code[:state_name/city_name] ] ]
  }
  geo none
  app-service [name]
  description [string]
```

```
edit address-list [[name] | all]
```

**options:**

```
  all-properties
  non-default-properties
```

**DISPLAY**

```
list address-list [[name] | all | [property]]
show running-config address-list [[name] | all | [property]]
```

**DELETE**

```
delete address-list [[name] | all]
```

**DESCRIPTION**

You can use the address-list component to define reusable lists of addresses. You can use an address list in any of the following firewalls and firewall rule lists: net self, net route-domain, security firewall global-rules, security firewall rule-list, security firewall management-ip-rules, and ltm virtual. A firewall rule compares all of the addresses in the list to either the source or destination IP in the packet, depending on how you apply the list. If there is a match, the firewall rule takes an action, such as accepting or dropping the packet.

**EXAMPLES**

```
create address-list alist1 addresses add { 10.10.1.1 10.10.1.2
192.168.24.0/24 }
```

Creates a new address list, "alist1," with two IPv4 addresses and one IPv4 subnet.

```
modify address-list alist1 addresses modify { 10.10.1.1 { description
"management IP at wmed site3" } }
```

Modifies the above address list with a description for the first address.

```
modify alist1 geo add { TR:Istanbul }
```

Modifies the above address list with an addition of a country:city/state.

```
modify address-list alist1 addresses add { 2001:DB8:a::/64 }
```

Modifies the same address list by adding an IPv6 subnet.

```
list address-list alist1
```

```

security firewall address-list alist1 {
  addresses {
    10.10.1.1 {
      description "management IP at wmed site3"
    }
    10.10.1.2 { }
    192.168.24.0/24 { }
    2001:db8:a::/64 { }
  }
}

```

Shows the modified address list.

```
create address-list xyz fqdns add { xyz.com }
```

Creates a new address list, "xyz" with a single fully qualified domain 'xyz.com'.

```
modify address-list xyz addresses add { 2001:DB8:a::/64 } fqdns add {
abc.com }
```

Modifies the same address list by adding an IPv6 subnet and another fully qualified domain 'abc.com'.

```
list address-list xyz
security firewall address-list xyz {
  addresses {
    2001:db8:a::/64 { }
  }
  fqdns {
    abc.com { }
    xyz.com { }
  }
}

```

Shows the above address list 'xyz'.

#### OPTIONS

##### addresses

Specifies a list of IP addresses and/or subnets to compare against a packet's source or destination address. The format for an IPv4 address is a.b.c.d[/prefix]. The general format for an IPv6 address is a:b:c:d:e:f:g:h[/prefix]; you can shorten this by eliminating leading zeros from each field (for example, you can shorten "2001:0db7:3f4a:09dd:ca90:ff00:0042:8329" to "2001:db7:3f4a:9dd:ca90:ff00:42:8329"), and/or by removing the longest contiguous field of zeros (for example, you can shorten "2001:0:0:0:c34a:0:23ff:678" to "2001::c34a:0:23ff:678"). TMSH accepts any valid text representation of IPv6 addresses, as defined in RFC 2373 (see ).

The next keyword specifies the action to take with the addresses (add, delete, modify, or replace the current set of addresses).

**add** Creates a new address list, which you specify next with IP addresses and/or prefixes in curly braces ({}).

##### delete

Deletes the address(es) that you specify next, in curly braces ({}).

##### modify

Makes it possible to replace the optional description(s) for the address(es). You can specify a description in a nested set of curly braces after each address.

##### replace-all-with

Replaces the current set of IP addresses with the address(es) that you specify next, in curly braces ({}).

##### fqdns

Specifies a list of fully qualified domain names to compare against packet's destination IP address domain.

The next keyword specifies the action to take with the fqdns (add, delete, or replace the current set of fqdns).

**geo** Specifies a list of geographic locations that the packet will be compared against.

##### app-service

Associates this address list with a particular Application Service. An Application Service is a major component of an iApp, an advanced configuration tool for creating and maintaining similar applications on multiple servers. The asm module (see asm) has components for working with iApps.

##### description

Is your description for this address list.

#### SEE ALSO

## security firewall config-change-log

**NAME**  
config-change-log - Configures firewall configuration change log setting.

**MODULE**  
security firewall

**SYNTAX**  
Modify the config-change-log component within the security firewall module using the syntax shown in the following sections.

**MODIFY**  
modify config-change-log log-changes [automatic | on | off]  
modify config-change-log log-publisher [none | [name]]

**DISPLAY**  
list config-change-log  
show running-config config-change-log

**DESCRIPTION**  
You can use the config-change-log component to configure if changes to the firewall rules should be logged or not. The default is to automatically determine if log is needed based on the mode of the on-demand-compilation. If the mode of the on-demand-compilation is 'enabled', the changes will be logged. If change log is enabled, a publisher need to be configured too.

**EXAMPLES**  
modify config-change-log log-changes on log-publisher local-db-publisher

**COPYRIGHT**

## security firewall container-stat

**NAME**  
container-stat - Show the compilation result of firewall rules.

**MODULE**  
security firewall

**SYNTAX**  
show container-stat

**DESCRIPTION**  
You can use the container-stat component to display the compilation result of firewall rules for each container. For firewall rules, a container is uniquely identified by the combination of context type, context name and policy type. The outputs of the command include: the time it takes to compile the rules and to perform overlapping check for each container, the number of micro-rules, the size of the containers in bytes, the amount of memory used for compilation, and the time the container is activated.

**EXAMPLES**  
show security firewall container-stat

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2015-03-1security firewall container-stat(1)

---

## security firewall current-state

**NAME**  
current-state - Show the current state of firewall rules compilation.

**MODULE**  
security firewall

**SYNTAX**  
show current-state

**DESCRIPTION**  
You can use the current-state component to display the current system-wide state of firewall rules compilation. The outputs of the command includes: the mode of on-demand compilation and on-demand rule deploy (enabled or disabled), the rule compiler status (quiescent, pending-compilation, being-compiled, pending-deployment, being-deployed, failed-compilation, failed-deployment, pccd-failed), compilation start time, compilation end time, deployment start time, deployment end time, aggregate number of micro-rules, active blob name, blob creation time, and if the blob MD5 is verified or not.

**EXAMPLES**  
show security firewall current-state

**SEE ALSO**  
security firewall on-demand-compilation, security firewall on-demand-rule-deploy

## security firewall fqdn-entity

**NAME**  
fqdn-entity - Perform on-demand refresh to query IP mappings for one (or all) configured FQDNs in firewall rules.

**MODULE**  
security firewall

**SYNTAX**  
Use the fqdn-entity component within the security firewall module to perform on-demand refresh to query IP mappings for a specific FQDN (or all FQDNs) configured in firewall rules using the following syntax:

**DISPLAY**  
load fqdn-entity [all | name]

**DESCRIPTION**  
You can use the fqdn-entity component to perform on-demand refresh to query IP mappings for one or all configured FQDNs in firewall rules.

BigIP will periodically refresh IP mappings for each FQDN upon previous mappings expiry time or after refresh-interval as configured in security firewall global-fqdn-policy whichever is greater. fqdn-entity component can be used to refresh the IP mappings irrespective of either the expiry time or the refresh-interval.

**EXAMPLES**  
load fqdn-entity all

Perform on-demand refresh for all the configured FQDNs in firewall rules.

```
load fqdn-entity f5.com
```

```
Perform on-demand refresh for fqdn 'f5.com' configured in one of the
firewall rules.
```

SEE ALSO

```
security firewall address-list, security firewall policy, security
firewall rule-list, security firewall fqdn-info, security firewall
global-fqdn-policy
```

COPYRIGHT

```

## security firewall fqdn-info

NAME

```
fqdn-info - Query run time information for one (or all) configured
FQDNs in firewall rules.
```

MODULE

```
security firewall
```

SYNTAX

```
Use the fqdn-info component within the security firewall module to
query run time information for one (or all) configured FQDNs in
firewall rules using the following syntax:
```

DISPLAY

```
show fqdn-info fqdn [all | name]
```

DESCRIPTION

```
You can use the fqdn-info component to query run time information for
one or all configured FQDNs in firewall rules. Use option fqdn to query
information regarding a specific FQDN or all FQDNs configured in
firewall rules.
```

```
Following information related to each FQDN is queried using fqdn-info
component:
```

- a) Last Refresh time.
- b) Next Refresh time.
- c) Last Successful Refresh.
- d) DNS Records valid until
- e) IP Addresses

OPTIONS

```
fqdn Specifies the name of a FQDN. Use 'all' to query information for
all configured FQDNs.
```

EXAMPLES

```
show fqdn-info fqdn all
```

```
Query information for all the configured FQDNs in firewall rules.
```

```
show fqdn-info fqdn f5.com
```

```
Query information for fqdn 'f5.com' configured in one of the firewall
rules.
```

SEE ALSO

```
security firewall address-list, security firewall policy, security
firewall rule-list
```

COPYRIGHT

```
No part of this program may be reproduced or transmitted in any form or

```

---

## security firewall global-fqdn-policy

**NAME**  
global-fqdn-policy - Configures the global fqdn policy which is used to resolve FQDN names to IP Address mappings for the FQDN names that are specified in the firewall rules.

**MODULE**  
security firewall

**SYNTAX**  
Modify the global-fqdn-policy component within the security firewall module using the syntax shown in the following sections.

**MODIFY**  
modify global-fqdn-policy  
options:  
app-service [name]  
description [string]  
dns-resolver [ [resolver\_name] | none ]  
refresh-interval [integer]

edit global-fqdn-policy  
options:  
all-properties  
non-default-properties  
one-line  
partition  
recursive

**DISPLAY**  
list global-fqdn-policy  
show running-config global-fqdn-policy  
options:  
all-properties  
non-default-properties  
one-line  
partition  
recursive

**DESCRIPTION**  
You can use the global-fqdn-policy component to configure a net dns-resolver that will be used by firewall to resolve FQDN names to IP Address mappings. These mappings in turn will be used to match firewall rules (across all policies on all contexts) based on FQDN constraints.

**EXAMPLES**  
modify global-fqdn-policy dns-resolver xyz  
  
Modifies the global-fqdn-policy to use dns resolver object named 'xyz'. Default refresh-interval is 60 minutes.  
  
modify global-fqdn-policy dns-resolver xyz refresh-interval 120  
  
Modifies the global-fqdn-policy to use dns resolver object named 'xyz' and specify periodic refresh rate of 120 minutes (2 hours) to re-resolve FQDN-to-IP mappings.  
  
list global-fqdn-policy  
  
Displays the current list of global-fqdn-policy contents.

**OPTIONS**  
app-service  
Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

description  
User defined description.

dns-resolver  
Specifies an existing net dns-resolver. This will be used by firewall to obtain FQDN-to-IP Address mappings which will be used to match firewall rules based on FQDN constraints. Note dns-resolver none can be used to remove the object from global-fqdn-policy if and only if there are no AFM rules with (non empty) FQDN constraints.

refresh-interval  
Specifies refresh interval to be used to re-resolve FQDN-to-IP mappings. Unit is in minutes and default is 60 minutes. Minimum allowed is 10 minutes and maximum is 46080 minutes.

**SEE ALSO**  
create, edit, list, modify, security firewall, security firewall policy, net dns-resolver tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## security firewall global-rules

**NAME**  
global-rules - Configures the global network firewall rules. These firewall rules are applied to all packets except those going through the management interface. They are applied first, before any firewall rules for the packet's virtual server, route domain, and/or self IP.

**MODULE**  
security firewall

**SYNTAX**

**MODIFY**  
modify global-rules  
options:  
description [string]  
enforced-policy [ [policy\_name] | none ]  
staged-policy [ [policy\_name] | none ]  
service-policy [ [policy\_name] | none ]

edit global-rules  
options:  
all-properties  
non-default-properties

reset-stats global-rules  
enforced-policy-rules { [rule name] }  
staged-policy-rules { [rule name] }

options:  
port-misuse

**DISPLAY**  
list global-rules  
show running-config global-rules

show global-rules  
active  
enforced-policy-rules  
staged-policy-rules

options:  
port-misuse  
overlapping-status

**DESCRIPTION**  
You can use the global-rules component to configure network firewall policy which is enforced or staged on all IP and ICMP traffic except traffic on the management IP.

**EXAMPLES**  
list global-rules

```
security firewall global-rules {  
    enforced-policy /Common/policy1  
}
```

Displays the current list of global rules.

**OPTIONS**

**description**  
Your description for the global list of firewall rules.

**enforced-policy**  
Specifies an enforced firewall policy. enforced-policy rules are enforced globally.

**enforced-policy-rules**  
Specifies firewall rules enforced on traffic globally via referenced enforced-policy.

**overlapping-status**  
Display detail overlapping information

**port-misuse**  
Used to show or reset global port misuse policy statistics.

**staged-policy**  
Specifies a staged firewall policy. staged-policy rules are not enforced while all the visibility aspects namely statistics, reporting and logging function as if the staged-policy rules were enforced globally.

**staged-policy-rules**  
Specifies firewall rules staged on traffic globally via referenced staged-policy.

**service-policy**  
Specifies a service policy that would apply to traffic globally. The service policy is applied to all flows, provided if there are no other context specific service policy configuration that overrides the global service policy. For example, when a service policy is configured both at a global level, as well as on a firewall rule, and a flow matches the rule, the more specific service policy configuration in the rule will override the service policy setting at the global level. The service policy associated here can be created using `net service-policy` command.

DISPLAY
list management-ip-rules
show running-config management-ip-rules

```

#### DESCRIPTION

You can use the management-ip-rules component to configure network firewall rules that are applied to all management interface traffic. The network software compares IP packets to the criteria specified in these rules. If a packet matches the criteria then the system takes the action specified by the rule. If a packet does not match a rule then the software compares the packet against the next rule. If a packet does not match any rule the packet is accepted.

For configuration sync management-ip-rules are synced to the devicegroup that has a type field of sync-failover. See "cm config-sync".

#### MATCHING AN IP PACKET

You can use this TMSH component to match against any or all of the following properties of an IP packet:

```

source address
source port
the packet's source VLAN
destination address
destination port
the higher-level protocol in the packet's payload

```

If you match against more than one of these items, a packet must pass all of your tests to successfully match. For example, if you match against a source subnet and several destination ports, a packet must originate from the given subnet and must also have one of the specified destination ports.

#### RULE ORDER

Rules are evaluated in the order that you specify. You can use the list management-ip-rules command to see the current rule order. As you add or modify rules in this component, you can use the place-before rule-name or place-after rule-name option to choose the rule's place in the sequence.

Rule order can determine whether or not a packet is dropped. Consider the following rules:

```

rule a, matches source addresses against 172.16.0.0 and ACCEPTS all
packets that match.
rule d, matches source addresses against 172.16.39.0 and DROPS all
packets that match.

```

Also consider a packet from a host at 172.16.39.55. If rule\_a appears before rule\_d in the rule list, the packet's source address matches rule\_a first and the software accepts it. The software never reaches rule\_d for comparison. If rule\_d appears first instead, the packet's source address now matches rule\_d; in this case, the software drops the packet.

#### EXAMPLES

```

modify management-ip-rules rules add { reject-internal-net { source {
addresses replace-all-with { 172.27.0.0/16 } } action reject place-
before first } }

```

Creates a rule entry at the beginning of the list that rejects traffic from the 172.27.0.0 network.

```

modify management-ip-rules rules add { reject-insecure-ports { rule-
list block_bad_mgmt place-before first } }

```

Adds a sub rule list to the management-IP firewall. Use the "security firewall rule-list" component to create a custom rule list.

```

list management-ip-rules
security firewall management-ip-rules {
  rules {
    reject-insecure-ports {
      rule-list block_bad_mgmt
    }
    reject-internal-net {
      action reject
      source {
        addresses {
          172.27.0.0/16 { }
        }
      }
    }
  }
}

```

}

Displays the current list of management-firewall rules.

modify management-ip-rules rules delete { reject-internal-net }

Removes the reject-internal-net rule from the management-IP firewall.

#### OPTIONS

description

Your description for the management-firewall rules.

rules

Adds, deletes, or replaces a firewall rule.

add Creates a new rule, which you specify next with a unique string in curly braces {}. Use the place-before or place-after option inside the curly braces to determine the order of the rule. If this is the first rule, use the replace-all-with option instead of add.

delete

Deletes the rule that you specify next, in curly braces {}.

modify

Modifies the existing rule that you specify next, in curly braces {}. After the rule name, enter the new configuration settings for the rule inside a nested set of curly braces.

replace-all-with

Replaces the current set of global rules with the rule(s) that you specify next, in curly braces {}. Use this option for the first management rule.

none Empties the list of management-firewall rules. This implicitly accepts all packets on the management interface.

Enter the name of a rule to be added or modified, then enter an open curly brace {}, one or more of the following options, and a closed curly brace {}.

action

Specifies the action that the system takes when a packet matches the rule.

accept

Specifies that a matching packet should be accepted. The security software stops comparing a matching packet to any other management-firewall rules.

accept-decisively

This option is functionally the same as accept.

drop

Specifies that a matching packet should be silently dropped. The security software sends nothing back to the packet source, and it does not compare the packet to any other management-firewall rules.

reject

Specifies that a matching packet should be dropped. For TCP-based protocols, the security software sends a TCP reset (with the RST flag raised) back to the source. For other protocols, reject is equivalent to drop.

app-service

Associates the management-rule list with a particular Application Service. An Application Service is a major component of an iApp, an advanced configuration tool for creating and maintaining similar applications on multiple servers. The asm module has components for working with iApps.

description

Your description for the current rule.

destination

Matches against each packet's destination IP and/or destination port. The next options choose the matching criteria.

address-lists

Specifies a list of IP-address lists (see "security firewall address-list") to compare against the packet's destination address.

This list uses the same add, delete, none, and replace-all-with options described above for rules, as well as a default option.

addresses

Specifies a list of IP addresses and/or subnets to compare against the packet's destination address.

The format for an IPv4 address is a.b.c.d[/prefix]. The general format for an IPv6 address is a:b:c:d:e:f:g:h[/prefix]; you can shorten this by eliminating leading zeros from each field (for example, you can shorten "2001:0db7:3f4a:09dd:ca90:ff00:0042:8329" to "2001:db7:3f4a:9dd:ca90:ff00:42:8329"), and/or by removing the longest contiguous field of zeros (for example, you can shorten "2001:0:0:0:c34a:0:23ff:678" to "2001::c34a:0:23ff:678"). TMSH accepts any valid text representation of IPv6 addresses, as defined in RFC 2373

(see ).

To edit this list, use the same add, delete, modify, none, and replace-all-with options described above for rules.

#### port-lists

Specifies a collection of port lists (see "security firewall port-list") to compare against the packet's destination port. If you use this option to specify a port list, a packet only matches if its destination port matches a port on these lists.

This list uses the same add, delete, none, and replace-all-with options described above for rules, as well as a default option.

#### ports

Specifies a list of ports and port ranges to compare against the packet's destination port.

To edit this list, use the same add, delete, modify, none, and replace-all-with options described above for rules.

**icmp** Specifies a list of ICMP types and codes to compare against the packet. You must set the ip-protocol option to "icmp" for this option to function. If you use this option, the current rule only matches ICMP packets that have the ICMP properties you specify here. You can add, delete, or modify (that is, change the description of) any entry in the list, or replace-all-with a new set of entries that you specify between curly braces ({}).

Use the standard integer identifiers to specify an ICMP type. For example: 3 is destination unreachable and 3:1 is destination unreachable with a code of host unreachable. The official list of ICMP types and codes is here:

.

#### ip-protocol

Specifies the IP protocol to compare against the packet. This could be a layer-3 protocol (such as ipv4 or ipv6), or a higher-level protocol like ospf, rdp, or icmp. If you specify this option, a packet only matches if it uses the chosen protocol. Press the key for a full list of valid protocols.

**log** Specifies whether the security software should write a log entry for all packets that match this rule. You must also enable network filter logging in the "security log profile" component for this option to have any effect. Note that the security software always increments the statistics counter when a packet matches a rule, no matter how you set this option.

#### place-after [first | last | rule-name]

Specifies that a new rule should be placed after the first rule, the last rule, or the rule-name you specify. If you are adding individual rules (as opposed to specifying replace-all-with), then you must use place-before or place-after to specify the rule's position in the list.

#### place-before [first | last | rule-name]

Specifies that a new rule should be placed before the first rule, the last rule, or the rule-name you specify. If you are adding individual rules (as opposed to specifying replace-all-with), then you must use place-before or place-after to specify the rule's position in the list.

#### rule-list

Specifies a full rule list instead of a customized rule that you might define with the other options. See "security firewall rule-list". If you use this option, then only the schedule and status options are valid; the tmsh software rejects any other options that you attempt to use with rule-list.

#### schedule

Specifies a schedule for the rule. See "security firewall schedule". If you omit this option, the rule or rule list is enabled all the time.

If the rule refers to a rule-list, the rule-list is enabled according to the schedule. When the rule list is enabled, the security software then honors the schedules defined within the rule-list.

#### source

Matches against each packet's source IP, source port, and/or source VLAN. The next options choose the matching criteria.

#### address-lists

Specifies a list of address lists (see "security firewall address-list") to compare against the packet's source address.

This list uses the same add, delete, none, and replace-all-with options described above for rules, as well as a default option.

#### addresses

Specifies a list of IP addresses and networks to compare against the packet's source address.

The format for an IPv4 address is a.b.c.d. The general format for an IPv6 address is a:b:c:d:e:f:g:h.

To edit this list, use the same add, delete, modify, none, and replace-all-with options described above for rules.

#### port-lists

Specifies a collection of port lists (see "security firewall port-list") to compare against the packet's source port. If you use this option to specify a port list, a packet only matches if its source port matches a port on these lists.

This list uses the same add, delete, none, and replace-all-with options described above for rules, as well as a default option.

#### ports

Specifies a list of ports and port ranges to compare against the packet's source port.

To edit this list, use the same add, delete, modify, none, and replace-all-with options described above for rules.

#### vlan

Specifies a list of VLANs, VLAN groups, and tunnels to compare against the packet.

This list uses the same add, delete, none, and replace-all-with options described above for rules, as well as a default option.

#### status

Specifies whether the rule is enabled, disabled or scheduled. A rule that is enabled is always checked. A rule that is disabled is never checked. A rule that is scheduled is checked according to the corresponding schedule configuration. A rule that is scheduled must have an associated schedule configuration.

## security firewall matching-rule

#### NAME

matching-rule - Shows the best match firewall rule amongst all the admin configured Network Firewall rules in different contexts (global, route-domain, VIP/SelfIP) given source/destination IP address and port, protocol and user configured vlan name. You can only use the show command with this component.

#### MODULE

security firewall

#### SYNTAX

```
show matching-rule
  dest-addr [IP address]
  source-addr [IP address]
  dest-port [TCP/UDP port]
  source-port [TCP/UDP port]
  protocol [protocol]
  vlan [vlan name]
```

#### DESCRIPTION

With user provided VLAN, source/destination IP addresses, TCP/UDP ports and protocol, the command will try to match these parameters against user configured ACL rules in global, route domain, VIP/SelfIP context, and return the best match rules. Both IPv4 and IPv6 addresses and all possible protocols are supported. This command can be used as a diagnostic tool to trouble-shoot BigIP firewall configuration problem. It provides a faster way to identify which ACL rule will have impact to the specified packet stream.

EXAMPLES  
# show security firewall matching-rule dest-addr 1.1.1.1 dest-port 140  
source-addr 2.2.2.2 source-port 141 protocol 10 vlan /Common/internal

Firewall Matching Rule:

```
-----  
Context Type Context Name Policy Name Rule Name Action  
-----  
Global globalrule Accept
```

Total records returned: 1

## security firewall on-demand-compilation

NAME  
on-demand-compilation - Configures the compilation mode of firewall  
rules.

MODULE  
security firewall

SYNTAX  
MODIFY  
modify on-demand-compilation mode [disabled | enabled]

DISPLAY  
list on-demand-compilation mode  
show running-config on-demand-compilation mode

TRIGGER ON-DEMAND COMPILATION  
run on-demand-compilation

DESCRIPTION  
You can use the on-demand-compilation component to change the behavior  
of firewall rule compilation. By default the system will automatically  
compile the changes at each configuration change. You can change the  
behavior to manually trigger the compilation by setting the mode to  
enabled.

EXAMPLES  
modify security firewall on-demand-compilation mode enabled  
  
run security firewall on-demand-compilation

SEE ALSO  
security firewall on-demand-rule-deploy

COPYRIGHT

## security firewall on-demand-rule-deploy

NAME  
on-demand-rule-deploy - Configures the rule deploy mode of firewall  
rules.

```

MODULE
    security firewall

SYNTAX
    MODIFY
    modify on-demand-rule-deploy mode [disabled | enabled]

    DISPLAY
    list on-demand-rule-deploy mode
    show running-config on-demand-rule-deploy mode

    TRIGGER ON-DEMAND RULE DEPLOY
    run on-demand-rule-deploy

DESCRIPTION
    You can use the on-demand-rule-deploy component to change the behavior
    of firewall rule deployment. By default the system will automatically
    deploy the changes once the compilation is successful. You can change
    the behavior to manually trigger the rule deployment by setting the
    mode to enabled.

EXAMPLES
    modify security firewall on-demand-rule-deploy mode enabled

    run security firewall on-demand-rule-deploy

edit policy
options:
  all-properties
  non-default-properties

DISPLAY
list policy
show running-config policy
options:
  all-properties
  non-default-properties
  one-line

DESCRIPTION
  You can use the policy component to configure a shareable and reusable
  set of network firewall rules which can be associated as enforced or
  staged with a number of configuration objects of the following types:
  net self, ltm virtual, security firewall global-rules, net route-
  domain.

EXAMPLES
  modify policy rules add {
reject-internal-net {
  place-before first
  action reject
  source {
    addresses replace-all-with { 172.27.0.0/16 }
  }
} }

  Creates a rule entry at the beginning of the list that rejects traffic
  from the 172.27.0.0 network.

  modify policy rules delete reject-internal-net

  Removes the rule reject-internal-net from the list of rules.

  create security firewall policy p1 rules add { r1 { source { geo add {
US } } action reject place-after first } } Creates a policy with a
single rule that rejects all packets from the US.

  create security firewall policy xyz rules add { r1 { destination {
fqdns add { f5.com } } action accept place-after first } } Creates a

```

policy named 'xyz' with a single rule (named 'r1') that accepts all packets with destination IP address in domain 'f5.com'.

list policy

Displays the current list of policy rules.

create policy "New Policy" copy-from "/Common/Existing Policy"

Creates a new policy New Policy by copying existing policy /Common/Existing Policy.

#### OPTIONS

description  
User defined description.

copy-from  
(CREATE) Specifies the name of an existing policy from which to copy all configuration options.

rules  
Adds, deletes, or replaces a firewall rule.

action  
Specifies the action that the system takes when a rule is matched.

accept  
Specifies that the current packet should be accepted.

accept-decisively  
Specifies that the current packet should be accepted and that packet will not be compared to any other firewall rules in any other context.

drop  
Specifies that the current packet should be silently dropped. Nothing is sent back to the packet source. The packet is not compared to any other firewall rules.

reject  
Specifies that the current packet should be dropped. For TCP based protocols a TCP reset is sent to the source. For other protocols reject is equivalent to drop.

description  
User defined description.

destination  
address-lists  
Specifies a list of address lists (see security firewall address-list) against which the packet will be compared.

addresses  
Specifies a list of addresses and networks against which the packet will be compared.

fqdns  
Specifies a list of fully qualified domain names to compare against packet's destination IP address domain.

geo  
Specifies a list of Geo Locations that the packet will be compared against.

port-lists  
Specifies a list of port lists (see security firewall port-list) against which the packet will be compared.

ports  
Specifies a list of ports and port ranges against which the packet will be compared.

icmp  
Specifies a list of ICMP types and codes against which the packet will be compared. The standard integer identifiers are used to specify an ICMP type Example: 3 is destination unreachable and 3:1 is destination unreachable with a code of host unreachable. The list of ICMP types and codes can be found here  
<http://www.iana.org/assignments/icmp-parameters/icmp-parameters.xml>.

ip-protocol  
Specifies the IP protocol against which the packet will be compared.

irule  
Specifies the name of the iRule that will be triggered when a packet matches this firewall rule. The firewall rule match raises a FLOW\_INIT iRule event.

irule-sample-rate  
Specifies the rate at which an iRule specified by irule option will be triggered when a packet matches this firewall rule. The rate is an integer value in the range 0-65535 and specifies how many packets must match this firewall rule before the iRule is triggered. The default value is 1 and causes the iRule to be triggered for every packet that matches this firewall rule. A value of 0 disables iRule triggering.

log  
Specifies whether the packet will be logged if it matches the rule. Logging must also be enabled in the corresponding logging configuration. (e.g. security log profile global-network when policy assigned to global-rules). Note that the statistics counter is always incremented when a packet matches a rule.

#### place-after

Specifies that a new rule should be placed after another rule, first or last. If individual rules are being added (as opposed to specifying replace-all-with) then place-before or place-after must be specified.

#### place-before

Specifies that a new rule should be placed before another rule, first or last. If individual rules are being added (as opposed to specifying replace-all-with) then place-before or place-after must be specified.

#### rule-list

Specifies a list of rules to evaluate. See security firewall rule-list. If a rule-list is specified then only the schedule and status properties effect the rule.

#### schedule

Specifies a schedule for the rule. See security firewall schedule. If the rule refers to a rule-list the rule-list will be enabled according to the schedule. When the rule list is enabled, the schedules defined within the rule-list will be honored.

#### source

##### address-lists

Specifies a list of address lists (see security firewall address-list) against which the packet will be compared.

##### addresses

Specifies a list of addresses and networks against which the packet will be compared.

##### fqdns

Specifies a list of fully qualified domain names to compare against packet's source IP address domain.

##### geo

Specifies a list of Geo Locations against which the packet will be compared.

##### port-lists

Specifies a list of port lists (see security firewall port-list) against which the packet will be compared.

##### ports

Specifies a list of ports and port ranges against which the packet will be compared.

##### v lans

Specifies a list of vlans, vlan groups and tunnels against which the packet will be compared.

#### status

Specifies whether the rule is enabled, disabled or scheduled. A rule that is enabled is always checked. A rule that is disabled is never checked. A rule that is scheduled is checked according to the corresponding schedule configuration. A rule that is scheduled must have an associated schedule configuration.

#### service-policy

Specifies the service policy configuration to use. (see "net service-policy"). The service policy can be used to set specific policy based configurations like flow timers, which applies to the flows that matches the rule.

#### virtual-server

Specifies the virtual server name that will be used for further traffic processing. Option is valid only for global and/or route domain contexts.

}  
edit port-list [[name] | all]  
options:  
all-properties  
non-default-properties  
DISPLAY  
list port-list [[name] | all | [property]]  
show running-config port-list [[name] | all | [property]]  
DELETE  
delete port-list [[name] | all]

**DESCRIPTION**  
You can use the port-list component to define reusable lists of ports for various firewall rules. The network software compares a packet's source port and/or destination port against ports in this list. You can assign a port list to the firewall rules in net self, net route-domain, security firewall global-rules, security firewall rule-list, sys management-ip, and ltm virtual firewall rules.

**EXAMPLES**  
create port-list p-list1 ports add { 80 }  
Creates a new port list with one entry.

```
list port-list
security firewall port-list _sys_self_allow_tcp_defaults {
  ports {
    domain { }
    f5-iquery { }
    https { }
    snmp { }
    ssh { }
  }
}
security firewall port-list _sys_self_allow_udp_defaults {
  ports {
    520 { }
    cap { }
    domain { }
    f5-iquery { }
    snmp { }
  }
}
security firewall port-list p-list1 {
  ports {
    http { }
  }
}
```

Shows all the port lists, including the one created in the previous example.

**OPTIONS**  
app-service  
Associates this port list with a particular Application Service. An Application Service is a major component of an iApp, an advanced configuration tool for creating and maintaining similar applications on multiple servers. The asm module has components for working with iApps.  
description  
Your description for the port list.  
ports  
Specifies a list of ports to compare against a packet's source or destination port. Use one of the keywords below and then specify the port(s) to add or delete. Specify ranges of ports with a dash between the two ends of the range (for example, 80-88).  
add Creates a new port list, which you specify next with port numbers in curly braces ({}).  
delete  
Deletes the port(s) that you specify next, in curly braces ({}).  
modify  
Is not supported for this component.  
replace-all-with  
Replaces the current set of ports with the port(s) that you specify next, in curly braces ({}).

## security firewall port-misuse-policy

**NAME**

port-misuse-policy - Configures the port misuse policies.

**MODULE**

security firewall

**SYNTAX**

Configure the port misuse policy component within the security firewall module using the syntax shown in the following sections.

**CREATE/MODIFY**

```
create port-misuse-policy [name]
modify port-misuse-policy [name]
options:
  app-service [[string] | none]
  description [string]
  drop-on-l7-mismatch [no | yes]
  log-on-l7-mismatch [no | yes]
  rules [add | delete | modify | replace-all-with] {
    [rule name] ] {
options:
  description [string]
  drop-on-l7-mismatch [no | yes | use-policy-setting]
  ip-protocol [sctp | tcp | udp]
  l7-protocol [protocol name]
  log-on-l7-mismatch [no | yes | use-policy-setting]
  port [port]
  }
}
rules none
```

```
edit port-misuse-policy [[name] | all]
options:
  all-properties
  non-default-properties
```

**DISPLAY**

```
list port-misuse-policy
show running-config port-misuse-policy
options:
  all-properties
  non-default-properties
  one-line
```

**DELETE**

```
delete port-misuse-policy [[name] | all]
```

**DESCRIPTION**

You can use the port-misuse-policy component to configure a shareable and reusable set of network port misuse policies which can be associated with a service policy objects. A port misuse policy has one or more rules that match connections by IP transport layer (L4) protocol and port number. Each rule must have a unique L4 protocol and port combination within the policy. When connection matches a policy rule (i.e. L4 protocol/port pair) the first data packet of the connection is tested to conform to application (L7) protocol specified in the rule. If data conforms to the L7 protocol (or test is inconclusive) the policy stops. The connection is allowed to proceed normally and data is processed as if no policy is in use. If data definitely does not conform to the specified L7 protocol the connection is treated according to configuration of the matched rule or the policy if rule uses policy defaults. In this case the rule or policy can drop the connection or allow it to proceed, and can also log an event about L7 protocol mismatch.

Port misuse policy (via service policy) can be associated with objects of the following types: ltm virtual, net route-domain, global. Several port misuse policies can be associated with objects of each type. In addition to service policy specified in the object itself, service policies could be associated with ACL rules of the security firewall policy, if it is associated with the object. When more than one policy is associated with the object the most specific port misuse rule is

used. For example, if connection matches an ACL rule which has a service policy with port misuse policy also having a rule matching the connection, that port misuse rule is applied. Otherwise the port misuse rule associated via virtual's service policy is applied, if such rule exists and matches the connection. See also net service-policy.

Port misuse policies could be specified for both virtual server and route domain objects associated with the connection. In this case all policies are applied. If a policy has a matching rule that drops the connection, and connection fails to pass L7 protocol test, the connection is terminated and remaining policies are not applied.

#### EXAMPLES

```
create security firewall port-misuse-policy web-ports-policy
drop-on-l7-mismatch no log-on-l7-mismatch yes rules add { p80 { ip-
protocol tcp port 80 l7-protocol http drop-on-l7-mismatch yes } p8080 {
ip-protocol tcp port 8080 l7-protocol http } }

list security firewall port-misuse-policy web-ports-policy
security firewall port-misuse-policy web-ports-policy {
  drop-on-l7-mismatch no
  log-on-l7-mismatch yes
  rules {
    p80 {
      drop-on-l7-mismatch yes
      l7-protocol http
      port http
    }
    p8080 {
      l7-protocol http
      port webcache
    }
  }
}
```

Creates port misuse policy with rules for tcp ports 80 and 8080 that test if first data packet looks like HTTP. The rule p80 tests all connections that have destination port TCP 80 and drops them if the first data packet does not look like HTTP. The rule p8080 tests all connections that have destination port TCP 8080 and logs an event if the first data packet does not look like HTTP (because of policy defaults).

```
modify security firewall port-misuse-policy web-ports-policy { rules
add { p8888 { port 8888 drop-on-l7-mismatch yes }}}
```

Adds a new rule p8888 to port misuse policy web-ports-policy that tests all connections to TCP port 8888 and drops them and logs an event when the first data packet does not look like HTTP.

```
list security firewall port-misuse-policy
```

Displays the current port misuse policy configuration list.

#### OPTIONS

description  
User defined description.

drop-on-l7-mismatch  
Indicates if the connection should be dropped when there is a matching rule in the policy that has drop-on-l7-mismatch set to use-policy-setting and connection that matches that rule fails L7 protocol test. The default is yes.

log-on-l7-mismatch  
Indicates if a port misuse event should be logged when there is a matching rule in the policy that has log-on-l7-mismatch set to use-policy-setting and connection that matches that rule fails L7 protocol test. The default is no.

rules  
Adds, deletes, or replaces a named port misuse policy rule.

description  
User defined description.

drop-on-l7-mismatch  
Indicates if the connection should be dropped when it matches this rule but fails L7 protocol test. Allowed values are yes, no, and use-policy-setting. The default is use-policy-setting.

ip-protocol  
Specifies the transport layer (L4) IP protocol for matching the connection. The valid protocols are sctp, tcp, and udp. A port and L4 protocol combination must be unique for the policy. The default is tcp.

l7-protocol  
Specifies the application layer (L7) protocol for the rule. When the connection matches the rule the first data packet is tested to conform to this protocol. If the test is negative the rule can drop the connection and/or log a port misuse event depending on other options. If the test is positive or inconclusive (not enough data) the connection is handled as if there was no port misuse policy associated with the given object (virtual server or route domain), and policies at other objects are applied. Press the key for a full list of valid protocols. The default protocol is http.

log-on-l7-mismatch  
Indicates if a port misuse event should be logged when the connection matches this rule but fails L7 protocol test. Allowed values are yes, no, and use-policy-setting. The

default is use-policy-setting.

port Specifies the destination port number for matching the connection. The valid values are 1-65535. A port and L4 protocol combination must be unique for the policy.

```

#### DESCRIPTION

You can use the rule-list component to configure network firewall rules to be applied to multiple firewalls. The network software compares IP packets to the criteria specified in these rules. If a packet matches the criteria then the system takes the action specified by the rule. If a packet does not match any rule in the list, the software accepts the packet or passes it to the next rule or rule-list (for example, the system compares the packet to net self-ip rules if the packet is destined for a network associated with a self-ip that has firewall rules defined).

#### MATCHING AN IP PACKET

You can use this TMSH component to match against any or all of the following properties of an IP packet:

```

source address
source fqdn
source geo
source port
the packet's source VLAN
destination address
destination fqdn
destination geo
destination port
the higher-level protocol in the packet's payload

```

If you match against more than one of these items, a packet must pass all of your tests to successfully match. For example, if you match against a source subnet and several destination ports, a packet must originate from the given subnet and must also have one of the specified destination ports.

#### RULE ORDER

The network software evaluates firewall rules in the order that you specify. You can use the list management-ip-rules command to see the current rule order. As you add or modify rules in this component, you can use the place-before rule-name or place-after rule-name option to choose the rule's place in the sequence.

Rule order can determine whether or not a packet is dropped. Consider the following rules:

```

rule_a, matches source addresses against 172.16.0.0 and ACCEPTS all
packets that match.
rule_d, matches source addresses against 172.16.39.0 and DROPS all
packets that match.

```

Also consider a packet from a host at 172.16.39.55. If rule\_a appears before rule\_d in the rule list, the packet's source address matches rule\_a first and the software accepts it. The software never reaches rule\_d for comparison. If rule\_d appears first instead, the packet's source address now matches rule\_d; in this case, the software drops the packet.

#### EXAMPLES

```

create rule-list block_bad_mgmt description "ports to be blocked on our
management interfaces" rules replace-all-with { reject_telnet { ip-
protocol tcp destination { ports add { telnet } } action reject } }

```

Creates a new rule list called block\_bad\_mgmt. It matches and rejects any TCP packet whose destination port is telnet. The description indicates that the rule is intended for the management-IP firewall.

```

modify rule-list block_bad_mgmt rules add { reject_http { ip-protocol
tcp destination { ports add { http } } action reject place-after last }
}

```

Modifies the above rule list by blocking HTTP traffic, too.

```
list rule-list block_bad_mgmt
security firewall rule-list block_bad_mgmt {
  description "ports to be blocked on our management interfaces"
  rules {
    reject_telnet {
      action reject
      destination {
        ports {
          telnet { }
        }
      }
    }
    ip-protocol tcp
  }
  reject_http {
    action reject
    destination {
      ports {
        http { }
      }
    }
  }
  ip-protocol tcp
}
}
```

Shows the above rule list, with both rules.

```
modify rule-list rules add { reject-internal-net { place-before first
action reject source { addresses replace-all-with { 172.27.0.0/16 } } }
}
```

Creates a rule entry at the beginning of the list that rejects traffic from the 172.27.0.0 network.

```
create security firewall rule-list r11 description "Geo Locations to be
blocked" rules add { r1 { source { geo add { US } } place-after first
action drop } }
```

Creates a new rule list "r11", which matches and rejects any packet with a US source. The description explains the purpose of the rule list.

```
modify security firewall rule-list r12 rules add { r2 { source { geo
add { CA } } place-before last action drop } }
```

```
security firewall rule-list r12 {
description "Geo Locations to be blocked"
rules {
  r2 {
    action drop
    source {
      geo {
        CA {
          state none
        }
      }
    }
  }
  r1 {
    action drop
    source {
      geo {
        US {
          state none
        }
      }
    }
  }
}
}
```

Shows the above rule list, with both rules.

```
create security firewall rule-list r11 description "domains to be
blocked" rules add { r1 { destination { fqdns add { xyz.com} } place-
after first action drop } }
```

Creates a new rule list "r11", which matches and rejects any packet with destination IP addresses in domain 'xyz.com'. The description explains the purpose of the rule list.

```
modify security firewall rule-list r11 rules modify { r1 { destination
{ fqdns add { abc.com } } } }
```

Modifies the above rule list by blocking destination IP addresses in domain 'abc.com' too.

```
list rule-list r11
security firewall rule-list r11 {
description "domains to be blocked"
rules {
  r1 {
    action drop
    destination {
      fqdns {
        abc.com { }
        xyz.com { }
      }
    }
  }
}
}
```

}

Shows the above rule list, with the single rule rl.

#### OPTIONS

##### app-service

Associates the rule list with a particular Application Service. An Application Service is a major component of an iApp, an advanced configuration tool for creating and maintaining similar applications on multiple servers. The asm module has components for working with iApps.

##### description

Your description for this list of firewall rules.

##### rules

Adds, deletes, or replaces a firewall rule.

**add** Creates a new rule, which you specify next with a unique string in curly braces ({}). Use the place-before or place-after option inside the curly braces to determine the order of the rule. If this is the first rule, use the replace-all-with option instead of add.

##### delete

Deletes the rule that you specify next, in curly braces ({}).

##### modify

Modifies the existing rule that you specify next, in curly braces ({}). After the rule name, enter the new configuration settings for the rule inside a nested set of curly braces.

**none** Empties the list of rules. An empty rule list implicitly accepts all packets. The security software skips this context and assesses packets against the next layer of firewall rules, if there is one (such as those defined for net self-ip, net route-domain or ltm virtual)

##### replace-all-with

Replaces the current list of rules with the rule(s) that you specify next, in curly braces ({}). Use this option for the first rule in the list.

Enter the name of a rule to be added or modified, then enter an open curly brace {}, one or more of the following options, and a closed curly brace {}.

##### action

Specifies the action that the system takes when a rule is matched.

##### accept

Specifies that a matching packet should be accepted. The security software stops comparing a matching packet to any other rules in the list. The software continues comparing the packet to rules in the next appropriate context (such as net self-ip, net route-domain or ltm virtual).

##### accept-decisively

Specifies that a matching packet should be accepted and should not be compared to any other firewall rules in any other context.

##### drop

Specifies that a matching packet should be silently dropped. The security software sends nothing back to the packet source. The security software does not compare the packet to any other firewall rules in any other context.

##### reject

Specifies that a matching packet should be dropped. For TCP-based protocols, the security software sends a TCP reset (with the RST flag raised) back to the source. For other protocols, reject is equivalent to drop.

##### description

Your description for the current rule.

##### destination

Matches against each packet's destination IP and/or destination port. The next options choose the matching criteria.

##### address-lists

Specifies a list of IP-address lists (see "security firewall address-list") to compare against the packet's destination address.

This list uses the same add, delete, none, and replace-all-with commands described above for rules, as well as a default command.

##### addresses

Specifies a list of IP addresses and/or subnets to compare against the packet's destination address.

The format for an IPv4 address is a.b.c.d[/prefix]. The general format for an IPv6 address is a:b:c:d:e:f:g:h[/prefix]; you can shorten this by eliminating leading zeros from each field (for example, you can shorten "2001:0db7:3f4a:09dd:0a90:ff00:0042:8329" to "2001:db7:3f4a:9dd:a90:ff00:42:8329"), and/or by

removing the longest contiguous field of zeros (for example, you can shorten "2001:0:0:c34a:0:0:678" to "2001::c34a:0:0:678"). TMSH accepts any valid text representation of IPv6 addresses, as defined in RFC 2373 (see ).

To edit this list, use the same add, delete, modify, none, and replace-all-with commands described above for rules.

#### fqdns

Specifies a list of fully qualified domain names to compare against packet's destination IP address domain.

To edit this list, use the same add, delete, none, and replace-all-with commands described above for rules.

geo Specifies a list of Geo Locations to compare a packet's source or destination Geo Location.

The format for a Geo Location is a 2 character string for the country code and a string for the state.

To edit this list, use the same add, delete, modify, none, and replace-all-with options described above for rules.

#### port-lists

Specifies a collection of port lists (see "security firewall port-list") to compare against the packet's destination port. If you use this option to specify a port list, a packet only matches if it's destination port matches a port on these lists.

If you combine address lists and port lists in the same rule, a packet must have a matching port and a matching address to fully match the rule.

This list uses the same add, delete, none, and replace-all-with commands described above for rules, as well as a default command.

#### ports

Specifies a list of ports and port ranges to compare against the packet's destination port.

To edit this list, use the same add, delete, modify, none, and replace-all-with commands described above for rules.

icmp Specifies a list of ICMP types and codes to compare against the packet. You must set the ip-protocol option to "icmp" for this option to function. If you use this option, the current rule only matches ICMP packets that have the ICMP properties you specify here. You can add, delete, or modify (that is, change the description of) any entry in the list, or replace-all-with a new set of entries that you specify between curly braces ({}).

Use the standard integer identifiers to specify an ICMP type. For example: 3 is destination unreachable and 3:1 is destination unreachable with a code of host unreachable. The official list of ICMP types and codes is here:

.

#### ip-protocol

Specifies the IP protocol to compare against the packet. This could be a layer-3 protocol (such as ipv4 or ipv6), or a higher-level protocol like ospf or rdp. If you specify this option, a packet only matches if it uses the chosen protocol. Press the key for a full list of valid protocols.

#### irule

Specifies the name of the iRule that will be triggered when a packet matches this firewall rule. The firewall rule match raises a FLOW\_INIT iRule event.

#### irule-sample-rate

Specifies the rate at which an iRule specified by irule option will be triggered when a packet matches this firewall rule. The rate is an integer value in the range 0-65535 and specifies how many packets must match this firewall rule before the iRule is triggered. The default value is 1 and causes the iRule to be triggered for every packet that matches this firewall rule. A value of 0 disables iRule triggering.

log Specifies whether the security software should write a log entry for all packets that match this rule. You must also enable network filter logging in the "security log profile" component for this option to have any effect. Note that the security software always increments the statistics counter when a packet matches a rule, no matter how you set this option.

#### place-after [first | last | rule-name]

Specifies that a new rule should be placed after the first rule, the last rule, or the rule-name you specify. If you are adding individual rules (as opposed to specifying replace-all-with), then you must use place-before or place-after to specify the rule's position in the list.

#### place-before [first | last | rule-name]

Specifies that a new rule should be placed before the first

rule, the last rule, or the rule-name you specify. If you are adding individual rules (as opposed to specifying replace-all-with), then you must use place-before or place-after to specify the rule's position in the list.

#### rule-list

Specifies a full rule list instead of a customized rule that you might define with the other options. If you use this option, then only the schedule and status options are valid; the tmsh software rejects any other options that you attempt to use with rule-list.

#### schedule

Specifies a schedule for the rule. See "security firewall schedule". If you omit this option, the rule or rule list is enabled all the time.

If the rule refers to a rule-list, the rule-list is enabled according to the schedule. When the rule list is enabled, the security software then honors any schedules defined within the rule-list.

#### source

Matches against each packet's source IP, source port, and/or source VLAN. The next options choose the matching criteria.

#### address-lists

Specifies a list of address lists (see "security firewall address-list") to compare against the packet's source address.

This list uses the same add, delete, none, and replace-all-with commands described above for rules, as well as a default command.

#### addresses

Specifies a list of IP addresses and networks to compare against the packet's source address.

The format for an IPv4 address is a.b.c.d. The format for an IPv6 address is a:b:c:d:e:f:g:h.

To edit this list, use the same add, delete, modify, none, and replace-all-with commands described above for rules.

#### fqdns

Specifies a list of fully qualified domain names to compare against packet's source IP address domain.

To edit this list, use the same add, delete, none, and replace-all-with commands described above for rules.

#### geo

Specifies a list of Geo Locations to compare a packet's source or destination Geo Location.

The format for a Geo Location is a 2 alphabet string for the country code and a string for the state.

To edit this list, use the same add, delete, modify, none, and replace-all-with options described above for rules.

#### port-lists

Specifies a collection of port lists (see "security firewall port-list") to compare against the packet's source port. If you use this option to specify a port list, a packet only matches if its source port matches a port on these lists.

This list uses the same add, delete, none, and replace-all-with commands described above for rules, as well as a default command.

#### ports

Specifies a list of ports and port ranges to compare against the packet's source port.

To edit this list, use the same add, delete, modify, none, and replace-all-with commands described above for rules.

#### vlan

Specifies a list of VLANs, VLAN groups, and tunnels to compare against the packet.

This list uses the same add, delete, none, and replace-all-with commands described above for rules, as well as a default command.

#### status

Specifies whether the rule is enabled, disabled or scheduled. A rule that is enabled is always checked. A rule that is disabled is never checked. A rule that is scheduled is checked according to the corresponding schedule configuration. A rule that is scheduled must have an associated schedule configuration.

#### service-policy

Specifies the service policy configuration to use. (see "net service-policy"). The service policy can be used to set specific policy based configurations like flow timers, which applies to the flows that matches the rule.

virtual-server  
Specifies the virtual server name that will be used for further traffic processing. Option is valid only for global and/or route domain contexts.

## security firewall rule-stat

NAME

rule-stat - Displays statistics of firewall rules on the BIG-IP(r) system. You can only use the show command with this component.

MODULE

security firewall

SYNTAX

```
show rule-stat
options:
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
field-fmt
```

DESCRIPTION

You can use the rule-stat component to display statistics of firewall rules.

EXAMPLES

```
show rule-stat
```

Displays firewall rule's statistics in the system default units.

```
show rule-stat raw
```

Displays raw firewall rule's statistics.

SEE ALSO

show, tmsh

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2013-03-21 security firewall rule-stat(1)

---

## security firewall schedule

NAME

schedule - Create a schedule that you can apply to firewall rules.

MODULE

security firewall

SYNTAX

```
CREATE/MODIFY
create schedule [name]
modify schedule [[name] | all]
```

```
options:
  app-service [name]
  daily-hour-end [hour:minute]
  daily-hour-start [hour:minute]
  date-valid-end [MM/DD/YYYY]
  date-valid-start [MM/DD/YYYY]
  description [text]
  days-of-week [ [monday | tuesday | wednesday | thursday | friday | saturday | sunday] ... ]
```

```
edit schedule [ [name] | [glob] | [regex] ] ... ]
```

#### DISPLAY

```
list schedule [[name] | all | [property]]
```

#### DELETE

```
delete schedule [[name] | all]
show running-config schedule [[name] | all | [property]]
```

#### DESCRIPTION

You use the schedule component to specify when to apply a firewall rule. You can specify a start time and an end time, some days of the week, a date when the schedule first starts, and/or a date when the schedule ends forever.

To apply the schedule to a firewall rule or rule list, edit the firewall or rule-list component. These are the firewalls and rule lists where you can apply schedules:

```
"security firewall global-rules"
"security firewall management-ip-rules"
"net self"
"net route-domain"
"ltm virtual"
"security firewall rule-list"
```

By default, all firewall rules are continuously active. By applying a schedule to a firewall rule, you reduce the time that the rule is running.

If you create a schedule without any scheduling specifications (such as daily-hour-start), the schedule is always active.

Note you may not delete a schedule that is being used by any firewall rule or rule list.

#### EXAMPLES

```
create schedule my_schedule1 date-valid-start now date-valid-end
12/31/2016 daily-hour-start 8:00 daily-hour-end 17:00
```

Creates a new schedule which is active between 8am and 5pm every day until December 31, 2016.

```
list schedule>
security firewall schedule my_schedule1 {
  daily-hour-end 17:00
  daily-hour-start 8:00
  date-valid-end 2016-12-31:00:00:00
  date-valid-start 2012-12-12:08:40:01
}
security firewall schedule workHours {
  daily-hour-end 18:00
  daily-hour-start 8:00
  days-of-week { monday tuesday wednesday thursday friday }
}
```

Lists two user-configured schedules, including the one that you created above.

```
modify schedule my_schedule1 days-of-week { monday tuesday wednesday }
```

Modifies the schedule named "my\_schedule1." This limits the schedule to running only on Mondays, Wednesdays, and Fridays.

#### OPTIONS

**app-service**  
Associates this schedule with a particular Application Service. An Application Service is a major component of an iApp, an advanced configuration tool for creating and maintaining similar applications on multiple servers. The asm module has components for working with iApps.

**description**  
Describes the schedule.

**daily-hour-end**  
Specifies the time of day this schedule stops. This end hour must be after the daily-hour-start value. The default is 24:00 (midnight).

A schedule may not contain hours that go past midnight (24:00): for example, a daily-hour-start of 20:00 and daily-hour-end of 02:00 is not allowed. If you need to cover both the late hours and early hours of the day, please create two schedules.

**daily-hour-start**  
Specifies the time of day this schedule starts. This start hour must be before the daily-hour-end value. The default is 0:00 (midnight at the start of the day).

**date-valid-end**  
Specifies the final date for this schedule. The schedule stops firing as of this date. You may specify just the specific date, or a specific date and time for the schedule to end. The date must be after the date-valid-start value. The default is 19:14

1/18/2038 (the latest date expressible with a 32-bit integer).

**date-valid-start**  
Specifies the start date for this schedule. The schedule does not fire before this date and time. You may specify just the specific date, or a specific date and time for the schedule to start. You must specify a date before the date-valid-end value. The default is midnight 1/1/1970 (Unix epoch).

**days-of-week**  
Specifies which days of the week the schedule fires. You must specify at least one day of the week, and you cannot specify any day of the week more than once. The default is all seven days.

## security firewall user-domain

**NAME**  
user-domain - Configures a user-domain for use by firewall rules.

**MODULE**  
security firewall

**SYNTAX**

**CREATE/MODIFY**  
create user-domain [name]  
modify user-domain [[name] | all]  
options:  
domain string  
ifmap-service [add | delete | modify | replace-all-with] {  
[ip]  
[port]  
[login]  
[password]  
}  
app-service [name]  
description [string]

edit user-domain [[name] | all]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list user-domain [[name] | all | [property]]  
show running-config user-domain [[name] | all | [property]]

**DELETE**  
delete user-domain [[name] | all]

**RUN**  
run user-domain [[name] | all] clear-cache

**DESCRIPTION**

A user-domain object holds attributes to reach services that provide more information about a user. This information includes the domain for which the service is defined, the identity service that can be used to validate this user and the ifmap service that can be used to obtain more information about the user. User domains also have associated cache data which is utilized by user identity feature for performance improvements. You can use the user-domain component to define reusable configuration that is used to learn about more users used in the firewall rules or clear their associated cache data on demand.

**EXAMPLES**

```
create user-domain gladiators identity-server add { felix-legions { ip 1.1.1.1 login maximus password meridius port 10002 } }
```

Creates a new user-domain object that defines a new identity-server for domain gladiators with an identity service felix-legions

```
modify user-domain gladiators ifmap-server add { rome { ip 10.10.10.10 login marcus password aurelius port 10002 } }
```

Modifies the above user domain to add an ifmap server.

```
run user-domain grumpy cat clear-cache
```

Clears the user identity cache associated with a specified user domain name.

```
run user-domain all clear-cache
```

Clears the user identity cache for all available user domains.

#### OPTIONS

domain

Specifies a domain for which the identity and ifmap services are defined.

app-service

Associates this user domain with a particular Application Service. An Application Service is a major component of an iApp, an advanced configuration tool for creating and maintaining similar applications on multiple servers. The asm module (see asm) has components for working with iApps.

description

User-defined description for this user domain.

clear-cache

Invokes clear-cache functionality for the given user-domain name.

#### SEE ALSO

edit, list, modify, net self, net route-domain, security firewall global-rules, security firewall management-ip-rules, security firewall rule-list, ltm virtual, tmsh

#### COPYRIGHT

BIG-IP 2016-03-14 security firewall user-domain(1)

---

## security firewall user-list

#### NAME

user-list - Configures a user-list for use by firewall rules. A firewall rule can match a packet sourced from a particular user against one of the users or user-groups in a user list, and can take some action (such as ACCEPT or DROP) for a matching packet. An incoming packet's source IP address is matched in user identity database to get the user and group properties which are then used to perform the rule match.

#### MODULE

security firewall

#### SYNTAX

CREATE/MODIFY

```
create user-list [name]
```

```
modify user-list [[name] | all]
```

options:

```
app-service [name]
```

```
description [string]
```

```
user-groups [add | delete | modify | replace-all-with] {
```

```
  [ [user group names...] ]
```

```
}
```

```
users [add | delete | modify | replace-all-with] {
```

```
  [ [user names...] ]
```

```
}
```

```
edit user-list [[name] | all]
```

options:

```
all-properties
```

```
non-default-properties
```

DISPLAY

```
list user-list [[name] | all | [property]]
```

DELETE

```
delete user-list [[name] | all]
```

#### DESCRIPTION

You can use the user-list component to define reusable lists of user or user-group names for various firewall rules. The network software compares a packet's source user (mapped by incoming source IP address) and group that user belong to, against users (or user-groups) in this list. You can assign a user list to the firewall rules in net self, net route-domain, security firewall global-rules, security firewall rule-

list, and ltm virtual firewall rules.

#### EXAMPLES

```
create user-list u-list1 users add { olympus\xyz }
```

Creates a new user list named u-list1 with one user named xyz in domain olympus.

```
create user-list u-list2 user-groups add { olympus\eng }
```

Creates a new user list named u-list2 with one group named eng in domain olympus.

```
list user-list
```

Shows all the user lists configured in the system.

#### OPTIONS

**app-service**

Associates this user list with a particular Application Service. An Application Service is a major component of an iApp, an advanced configuration tool for creating and maintaining similar applications on multiple servers. The asm module has components for working with iApps.

**description**

Your description for the user list.

**user-groups**

Specifies a list of user groups to compare against the groups a user belongs to (which is mapped from the source IP address).

**users**

Specifies a list of users to compare against a packet's source user (which is mapped from the source IP address).

#### SEE ALSO

edit, list, modify, net self, net route-domain, security firewall address-list, security firewall rule-list, security firewall global-rules, tmsh

#### COPYRIGHT

BIG-IP 2016-03-14 security firewall user-list(1)

---

## security http file-type

#### NAME

file-type - Lists the available file types that can be used in the context of HTTP Protocol Security.

#### MODULE

security http

#### SYNTAX

Retrieve the list of the file-type values using the syntax shown in the following sections.

##### DISPLAY

```
list file-type
list file-type [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
  all
  app-service
  one-line
```

#### DESCRIPTION

Use this command to display the possible values of the file-type object to be used in the context of HTTP Protocol Security. These possible values include predefined and user-defined file types that you can select to have the security profiles allow or disallow.

#### EXAMPLES

```
list file-type
```

Displays all the file types supported by HTTP Protocol Security.

#### OPTIONS

**app-service**

Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service

can modify or delete the object.

SEE ALSO

glob, list, regex, security http profile, tmsh

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2013-06-12 security http file-type(1)

---

## security http mandatory-header

NAME

mandatory-header - Lists the available mandatory headers that can be used in the context of HTTP Protocol Security.

MODULE

security http

SYNTAX

Retrieve the list of the mandatory-header values using the syntax shown in the following sections.

DISPLAY

```
list mandatory-header
list mandatory-header [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  app-service
  one-line
```

DESCRIPTION

Use this command to display the possible values of the mandatory-header object to be used in the context of HTTP Protocol Security. These possible values include predefined and user-defined HTTP headers that you can select to be required by the security profiles.

EXAMPLES

```
list mandatory-header
```

Displays all the mandatory headers supported by HTTP Protocol Security.

OPTIONS

**app-service**  
Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

SEE ALSO

glob, list, regex, security http profile, tmsh

COPYRIGHT

---

## security http profile

NAME

profile - Configures an HTTP security profile.

MODULE

security http

## SYNTAX

Configure the profile component within the security http module using the syntax shown in the following sections.

### CREATE/MODIFY

```
create profile [name]
modify profile [name]
options:
  app-service [[string] | none]
  [case-sensitive | case-insensitive]
  defaults-from [[name] | none]
  description [[string] | none]
  evasion-techniques {
    options:
    alarm [disabled | enabled]
    block [disabled | enabled]
  }
  file-types {
    options:
    alarm [disabled | enabled]
    [allowed | disallowed]
    block [disabled | enabled]
    values [add | delete | none | replace-all-with] { [string] ... }
  }
  http-rfc {
    options:
    alarm [disabled | enabled]
    bad-host-header [disabled | enabled]
    bad-version [disabled | enabled]
    block [disabled | enabled]
    body-in-get-head [disabled | enabled]
    chunked-with-content-length [disabled | enabled]
    content-length-is-positive [disabled | enabled]
    header-name-without-value [disabled | enabled]
    high-ascii-in-headers [disabled | enabled]
    host-header-is-ip [disabled | enabled]
    maximum-headers [[integer] | disabled]
    null-in-body [disabled | enabled]
    null-in-headers [disabled | enabled]
    post-with-zero-length [disabled | enabled]
    several-content-length [disabled | enabled]
    unparseable-content [disabled | enabled]
  }
  mandatory-headers {
    options:
    alarm [disabled | enabled]
    block [disabled | enabled]
    values [add | delete | none | replace-all-with] { [string] ... }
  }
  maximum-length {
    options:
    alarm [disabled | enabled]
    block [disabled | enabled]

list profile
list profile [ [ [name] | [glob] | [regex] ] ... ]
show running-config profile
show running-config profile [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

### DELETE

```
delete profile [name]
```

## DESCRIPTION

You can use the profile component to create, modify, display, or delete an HTTP security profile for use with HTTP Protocol Security functionality.

## EXAMPLES

```
create http my_http_profile defaults-from http_security
```

Creates a custom HTTP security named my\_http\_profile that inherits its settings from the system default HTTP security profile.

list profile

Displays the properties of all HTTP security profiles.

#### OPTIONS

app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

[case-sensitive | case-insensitive]

Specifies whether the security profile treats file types as case sensitive, or not. The default value is case-sensitive. Note: If you create a profile, you can use either property, thereafter it becomes read only. If the security profile is case insensitive, the system stores file types in lowercase in the security profile configuration.

defaults-from

Specifies the profile that you want to use as the parent profile. Your new profile inherits all settings and values from the parent profile specified. The default value is none.

description

User defined description.

evasion-techniques

Specifies what action the system takes when it detects an evasion technique. Evasion techniques are methods used by attackers to avoid detection of their attack. You can configure the following options for evasion technique checks:

alarm

Specifies, when enabled, that the system logs the request data and displays it in the Protocol Security Statistics screen whenever the system detects an evasion technique. The default value is enabled.

block

Specifies, when enabled, that the system stops requests whenever the system detects an evasion technique. The default value is disabled.

file-types

Specifies which file types the security profile considers legal, and specifies what action the system takes when it detects a request for an illegal file type. You can configure the following options for file types:

alarm

Specifies, when enabled, that the system logs the request data and displays it on the Protocol Security Statistics screen whenever the system detects a request for an illegal file type. The default value is enabled.

[allowed | disallowed]

Indicates whether the values property lists file types that the security profile permits or prohibits. Note: For each security profile you may define either allowed file types or disallowed file types.

block

Specifies, when enabled, that the system stops requests for an illegal file type. The default value is disabled.

values

Adds, deletes, or replaces a set of file types considered either legal or illegal by the security profile. You can either select an available file-type or add a new one.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

http-rfc

Specifies which validations the system should check and what action the system takes when it detects a request that is not formatted properly. You can configure the following options for HTTP protocol checks:

alarm

Specifies, when enabled, that the system logs the request data and displays it in the Protocol Security Statistics screen whenever a request fails one of the enabled HTTP protocol checks. The default value is enabled.

bad-host-header

Specifies, when enabled, that the system inspects requests to see whether they contain a non RFC compliant header value. The default value is enabled.

bad-version

Specifies, when enabled, that the system inspects requests to see whether they request information from a client using an HTTP protocol version 1.0 or higher. The default value is enabled.

block

Specifies, when enabled, that the system stops requests whenever the system detects an evasion technique. The default value is disabled.

body-in-get-head

Specifies, when enabled, that the system examines requests that use the HEAD or GET methods to see whether the requests contain data in their bodies, which is considered illegal. The default value is disabled.

**chunked-with-content-length**  
Specifies, when enabled, that the system examines chunked requests for a content-length header, which is not permitted. The default value is enabled.

**content-length-is-positive**  
Specifies, when enabled, that the system examines requests to see whether their content length value is greater than zero. The default value is enabled.

**header-name-without-value**  
Specifies, when enabled, that the system checks requests for valueless header names, which are considered illegal. The default value is enabled.

**high-ascii-in-headers**  
Specifies, when enabled, that the system inspects request headers for ASCII characters greater than 127, which are not permitted. The default value is disabled.

**host-header-is-ip**  
Specifies, when enabled, that the system verifies that the request's host header value is not an IP address. The default value is disabled.

**maximum-headers**  
Specifies whether the system compares the number of headers in the requests against the maximum number, and if so, how many headers are allowed. The default value is a maximum of 20 headers.

**null-in-body**  
Specifies, when enabled, that the system inspects request bodies to see whether they contain a Null character, which is not allowed. The default value is disabled.

**null-in-headers**  
Specifies, when enabled, that the system inspects request headers to see whether they contain a Null character, which is not allowed. The default value is enabled.

**post-with-zero-length**  
Specifies, when enabled, that the system examines POST method requests for no content-length header, and for a content length of 0. The default value is disabled.

**several-content-length**  
Specifies, when enabled, that the system examines each request to see whether it has more than one content-length header, which is considered illegal. The default value is enabled.

**unparsable-content**  
Specifies, when enabled, that the system examines requests for content that the system cannot parse, which is not permitted. The default value is enabled.

**mandatory-headers**  
Specifies which headers must appear in requests, and specifies what action the system takes when it detects a request without a mandatory header. You can configure the following options for mandatory headers:

**alarm**  
Specifies, when enabled, that the system logs the request data and displays it on the Protocol Security Statistics screen whenever a request does not include a mandatory header. The default value is enabled.

**block**  
Specifies, when enabled, that the system stops requests that do not include a mandatory header. The default value is disabled.

**values**  
Adds, deletes, or replaces a set of headers that must appear in requests to be considered legal by the security profile. You can either select an available mandatory-header or add a new one. Note: The system stores mandatory headers in lowercase in the security profile configuration, regardless of whether it is case sensitive or not.

**maximum-length**  
Specifies the default maximum length settings that the security profile considers legal, and specifies what action the system should take when it detects a request using an illegal length. You can configure the following options for length checks:

**alarm**  
Specifies, when enabled, that the system logs the request data and displays it on the Protocol Security Statistics screen whenever a request fails one of the length checks. The default value is enabled.

**block**  
Specifies, when enabled, that the system stops requests that fail one of the length checks. The default value is disabled.

**post-data**

Indicates whether there is a maximum acceptable length, in bytes, for the POST data portion of a request, and if so, specifies it. The default value is any (no restriction).

#### query-string

Indicates whether there is a maximum acceptable length, in bytes, for the query string portion of a request, and if so, specifies it. The default value is 1024 bytes.

#### request

Indicates whether there is a maximum acceptable length, in bytes, of a request, and if so, specifies it. The default value is any (no restriction).

uri Indicates whether there is a maximum acceptable length, in bytes, for a URL, and if so, specifies it. The default value is 1024 bytes.

#### methods

Specifies which HTTP methods the security profile considers legal, and specifies what action the system takes when it detects a request using an illegal method. You can configure the following options for methods:

#### alarm

Specifies, when enabled, that the system logs the request data and displays it on the Protocol Security Statistics screen whenever a request uses an illegal method. The default value is enabled.

#### block

Specifies, when enabled, that the system stops requests that use an illegal method. The default value is disabled.

#### values

Adds, deletes, or replaces a set of HTTP methods considered legal by the security profile. You can either select an available asm http-method or add a new one. Note: HTTP methods are case sensitive even if the security profile is case insensitive.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### partition

Displays the administrative partition within which the component resides.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### response

Specifies information to display when the security profile blocks a client request. You can configure the following options for blocking page:

body Specifies the HTML code the system sends to the client in response to an illegal blocked request. Only if the response type is custom, you can edit this text.

#### headers

Specifies the set of response headers that the system sends to the client in response to an illegal blocked request. Only if the response type is custom, you can edit this text. Separate each header with a new line (Ctrl-V followed by Ctrl-J).

type Specifies which content, or URL, the system sends to the client in response to an illegal blocked request.

#### custom

Specifies a modified response text. You can edit the response header and HTML code in the properties headers and body.

#### default

Specifies the system-supplied response text written in HTML. You cannot edit that text. This is the default value.

#### redirect

Specifies that the system redirects the user to a specific web page instead of viewing a blocking page. You can edit the redirect web page in the url property.

#### soap-fault

Specifies the system-supplied response written in SOAP fault message structure. You cannot edit that text. Use this type when a SOAP request is blocked due to an XML related violation.

url Specifies the particular URL to which the system redirects the user. Only if the response type is redirect, you can edit this text. The web page should include a full URL path, for example, <http://www.myredirectpage.com>.

## security ip-intelligence blacklist-category

### NAME

blacklist-category - Global list of ip-intelligence blacklist categories. These ip-intelligence blacklist categories are used to configure ip-intelligence policies.

### MODULE

security ip-intelligence

### SYNTAX

Configure the blacklist-category component within the security ip-intelligence module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
create blacklist-category [name]
modify blacklist-category [[name] | all]
options:
  app-service [name]
  description [string]
  bl-match-direction [destination | source | source-and-destination]
```

```
edit blacklist-category
```

```
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

#### DISPLAY

```
list blacklist-category
show running-config blacklist-category
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

### DESCRIPTION

You can use the blacklist-category component to configure a shareable and reusable blacklist category which can be configured with specific enforcement and logging settings under ip-intelligence policies.

### EXAMPLES

```
modify blacklist-category Malware description "A variety of forms of hostile or intrusive software."
```

Modifies the blacklist-category description.

```
list blacklist-category
```

Displays the current list of blacklist categories.

### OPTIONS

**app-service**  
Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

**description**  
User defined description.

**bl-match-direction**  
Indicates whether to match source IPs, destination IPs, or both.

**partition**  
Displays the administrative partition within which the component resides.

### SEE ALSO

create, edit, list, modify, security ip-intelligence feed-list, security ip-intelligence policy, tmsh

## COPYRIGHT

BIG-IP security7ip-intelligence blacklist-category(1)

---

## security ip-intelligence feed-list

### NAME

feed-list - Configures a feed-list for use by firewall. A feed-list is a list of URL feeds from where files are downloaded and the contents (IP-address prefixes) are compared against the source-IP address and/or destination-IP address in an IP packet by DWBL (Dynamic White/Black lists) by IP-Intelligence.

### MODULE

security ip-intelligence

### SYNTAX

Configure the feed-list component within the security ip-intelligence module using the syntax in the following sections.

#### CREATE/MODIFY

```
create feed-list [name]
modify feed-list [[name] | all]
options:
  feeds [add | delete | modify | replace-all-with] {
    name [string] {
      options:
        default-blacklist-category [string]
        default-list-type [whitelist | blacklist]
    }
    poll {
      interval [integer]
      user [string]
      url [string]
      password [string]
    }
  }
}
app-service [name]
description [string]
```

```
edit feed-list [[name] | all]
options:
  all-properties
  non-default-properties
```

```
load feed-list [[name] | all] feeds { name [string] }
```

#### DISPLAY

```
list feed-list [[name] | all | [property]]
show running-config feed-list [[name] | all | [property]]
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

#### DELETE

```
delete feed-list [[name] | all]
```

### DESCRIPTION

You can use the feed-list component to define reusable lists of feeds. You can use a feed list in a security ip-intelligence policy. A policy compares all of the addresses in the list (downloaded from a file at the specified url) to either the source or destination IP in the packet, depending on how you apply the list. If there is a match, the ip-intelligence policy takes an action, such as accepting or dropping the packet.

### EXAMPLES

```
create feed-list alist1 feeds add { poll { url http://f5.com/bl.txt }
```

Creates a new feed list, "alist1," with IPv4/IPv6 addresses in the file downloaded from the specified url.

```
modify feed-list alist1 feeds modify { description "DWBL file from f5.com" }
```

Modifies the above feed list with a description.

```
modify feed-list alist1 feeds modify { poll { url https://f5.com/bl.txt }
```

Modifies the same feed by changing the protocol.

```
list feed-list alist1
```

```

security ip-intelligence feed-list alist1 {
  feeds {
    url2 {
      poll {
        url https://f5.com/bl.txt
        user user1
        password user1_pwd
      }
    }
    description "DWBL file from f5.com"
  }
}

```

Shows the modified feed list.

```
load feed-list alist1 alist2 feeds { feed1 feed2 }
```

Immediately downloads and updates feeds feed1 and feed2 of feed lists alist1 and alist2.

#### OPTIONS

feeds

Adds, deletes, or replaces feeds. You can configure the following options for a feed:

name Specifies a name for a feed. This option is required for the operations create, delete, modify, and replace-all-with.

add Creates a new feed list.

delete

Deletes the feed list that you specify next, in curly braces ({}).

modify

Makes it possible to replace the optional description(s) for the feed list.

replace-all-with

Replaces the current set of feed list with the a new one that you specify next, in curly braces ({}).

default-list-type

Specifies a default type for this specific entry whether it is a blacklist or whitelist

whitelist

Specifies that this entry is a whitelist.

blacklist

Specifies that this entry is a blacklist.

default-blacklist-category

Default blacklist category type for all blacklist entries that do not have a corresponding category string (eg. Botnet, Spyware, Malware)

poll You can configure the following options under this:

interval

Specifies the frequency at which the url needs to be polled.

user Specifies the user which is used when downloading the url.

url Specifies the URL from where the white/black list will be downloaded. Note: Route domains are not supported when specifying the url.

password

Password for the user.

default-list-type

Specifies a default type for this specific entry whether it is a blacklist or whitelist

whitelist

Specifies that this entry is a whitelist.

blacklist

Specifies that this entry is a blacklist.

app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

default-blacklist-category

Default blacklist category type for all blacklist entries that do not have a corresponding category string (eg. Botnet, Spyware, Malware)

description

User defined description for this feed list.

partition

Displays the administrative partition within which the component resides.

## security ip-intelligence global-policy

**NAME**

global-policy - Configures the global ip-intelligence policy. These ip-intelligence policy contents/filters are applied to all packets except those going through the management interface. They are applied first, before any firewall rules for the packet's virtual server, route domain.

**MODULE**

security ip-intelligence

**SYNTAX**

Modify the global-policy component within the security ip-intelligence module using the syntax shown in the following sections.

**MODIFY**

modify global-policy

options:

app-service [name]  
description [string]  
ip-intelligence-policy [ [policy\_name] | none ]

edit global-policy

options:

all-properties  
non-default-properties  
one-line  
partition  
recursive

reset-stats global-policy

options:

ip-intelligence-categories

**DISPLAY**

list global-policy

show running-config global-policy

options:

all-properties  
non-default-properties  
one-line  
partition  
recursive

show global-policy

options:

ip-intelligence-categories

**DESCRIPTION**

You can use the global-policy component to configure a shareable and reusable set of network firewall DWBL (Dynamic White/Black lists) which can be enforced globally at the system level and the enforcement happens before the route-domain or virtual server level.

**EXAMPLES**

modify global-policy policy poll

Modifies the global-policy with policy poll.

list global-policy

Displays the current list of global-policy contents.

**OPTIONS**

app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

description

User defined description.

policy

Specifies an existing policy. policy contents are enforced at a

global level.

partition  
Displays the administrative partition within which the component resides.

ip-intelligence-categories  
Used to show/ reset statistics on IP intelligence white/ black lists categories.

SEE ALSO

## security ip-intelligence info

NAME

info - Query IP Intelligence information about specified IP Address.

MODULE

security ip-intelligence

SYNTAX

Use the info component within the security ip-intelligence module to query IP Intelligence information about the IP address using the following syntax.

DISPLAY

```
show info address [IP address]
options:
  virtual-server [name]
  route-domain [name]
```

DESCRIPTION

You can use the info component to query IP Intelligence information about an IP Address using IP Intelligence policy attached to the selected context. Global context is the default when the command is used without options. To select the virtual server or the route domain context use virtual-server or route-domain option. Only one option can be used. If the IP Address is listed in any of the DWBL (Dynamic White/Black List) feeds used by the selected IP Intelligence policy the query shows the list of categories and policy action (drop or allow) for the address. If the policy is configured to query legacy IP Reputation database, that information is also used in the query.

EXAMPLES

```
show info address 10.123.1.12
```

Query IP Intelligence information for IP address 10.123.1.12 using global IP Intelligence policy.

```
show info address 10.123.1.12 virtual-server /Common/vs
```

Query IP Intelligence information for IP address 10.123.1.12 using IP Intelligence policy configured for virtual server /Common/vs.

OPTIONS

virtual-server

Specifies the name of the virtual server configured with IP Intelligence policy to use in the query. This option cannot be used with the route-domain option.

route-domain

Specifies the name of the route domain configured with IP Intelligence policy to use in the query. This option cannot be used with the virtual-server option.

SEE ALSO

## security ip-intelligence policy

### NAME

policy - Configures an ip-intelligence policy. It's comprised of three logical groups of settings: list of feed lists, enforcement and logging settings per blacklist category, and default enforcement and logging settings for blacklist categories.

### MODULE

security ip-intelligence

### SYNTAX

Configure the policy component within the security ip-intelligence module using the syntax in the following sections.

#### CREATE/MODIFY

```
create policy [name]
modify policy [name]
options:
  app-service [name]
  description [string]
  blacklist-categories [add | default | delete | replace-all-with] {
    [name] {
      action [accept | drop | use-policy-setting]
      app-service none
      description none
      log-blacklist-hit-only [no | yes | use-policy-setting]
      log-blacklist-whitelist-hit [no | yes | use-policy-setting]
      match-direction-override [match-destination | match-source | match-source-and-destination]
    }
  }
  feed-lists [add | default | delete | replace-all-with] { [name] }
  default-action [accept | drop]
  default-log-blacklist-hit-only [ no | yes ]
  default-log-blacklist-whitelist-hit [ no | yes ]
```

#### edit policy

```
options:
  all-properties
  non-default-properties
```

#### DISPLAY

```
list policy [ [ [name] | [glob] | [regex] ] ... ]
show running-config policy
show running-config policy [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
  partition
  recursive
```

### DESCRIPTION

You can use the policy component to configure a shareable and reusable enforcement and logging settings on Dynamic White/Black lists of IPs coming from downloaded feeds. The policy can then be enforced on a number of configuration objects of the following types: ltm virtual, security ip-intelligence global-policy, net route-domain.

### EXAMPLES

```
create policy poll {
  blacklist-categories add {
    Spyware {
      action use-policy-setting
      app-service none
      description none
      log-blacklist-hit-only use-policy-setting
      log-blacklist-whitelist-hit yes
    }
  }
  feed-lists add { alist1 alist2 }
  default-action drop
  default-log-blacklist-hit-only yes
  default-log-blacklist-whitelist-hit no
  description none
  feed-lists none
  partition Common }

```

Creates a policy poll with feeds from alist1 and alist2 feed lists, specific enforcement and logging settings for Spyware blacklist category and policy default settings for other categories.

```
modify policy poll { feed-lists delete { alist2 } }
```

Removes the feed-list alist2 from the policy poll.

```
list policy
```

Displays the current list of ip-intelligence policies contents.

#### OPTIONS

##### app-service

Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

##### description

User defined description.

##### partition

Displays the administrative partition within which the component resides.

##### blacklist-categories

Adds, deletes, or replaces blacklist categories.

##### action

Specifies what enforcement action will be applied if the packet is categorized with this blacklist category. If the packet is categorized with more than one blacklists the most restrictive action will be applied.

##### log-blacklist-hit-only

Specifies if a log message will be generated if the packet is categorized with this blacklist and the packet's IP listed in no whitelists.

##### match-direction-override

Overrides the current IP match direction setting for a category. If this value has not been overridden, it will be set to the value of the parent category's bl-match-direction at the time that the category was added to the policy.

##### log-blacklist-whitelist-hit

Specifies if a log message will be generated if the packet is categorized with this blacklist and the packet's IP is listed in a whitelist.

##### feed-lists

Adds, deletes, or replaces a feed list. Specifies a list of feed lists (see security ip-intelligence feed-list) against which the packet will be compared.

##### default-action

Specifies a default enforcement action which will be performed on the matched packet unless an implicit action specified for one of the blacklist categories the packet's IP is categorized with. If the packet's IP is listed in a white list the action is always accept.

##### default-log-blacklist-hit-only

Specifies a default blacklist hit only logging action which will be performed on the matched packet unless an implicit action specified for one of the blacklist categories the packet's IP is categorized with.

##### default-log-blacklist-whitelist-hit

Specifies a default blacklist and whitelist hit logging action which will be performed on the matched packet unless an implicit action specified for one of the blacklist categories the packet's IP is categorized with.

## security log network-storage-field

#### NAME

network-storage-field - Lists the available storage format fields that can be used in the context of Network Security Logging.

#### MODULE

security log

**SYNTAX**  
Retrieve the list of the network-storage-field values using the syntax shown in the following sections.

**DISPLAY**  
list network-storage-field  
list network-storage-field [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all  
all-properties  
one-line  
app-service

**DESCRIPTION**  
Use this command to display the possible values of the network-storage-field object to be used in the context of Network Security Logging. These possible values are predefined traffic items available for the server to log in context of Network event logging (for example, ACL events, TCP Open/Close, TCP/IP error events).

**EXAMPLES**  
list network-storage-field  
  
Displays all the storage fields supported by Network Security Logging.

**OPTIONS**  
app-service  
Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

**SEE ALSO**  
glob, list, regex, security log profile, tmsh

**COPYRIGHT**

  non-default-properties
  one-line
  partition
  recursive
```

#### DELETE

```
delete profile [name]
```

#### DESCRIPTION

You can use the profile component to create, modify, display, or delete a Security log profile for use with Security Logging functionality.

#### EXAMPLES

```
create profile my_log_profile
```

Creates a custom Security log profile named my\_log\_profile with initial settings.

```
list profile
```

Displays the properties of all Security log profiles.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the profile belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the profile. Only the application service can modify or delete the profile.

##### application

Adds, deletes, or replaces a single Application Security sub-profile. You can configure the following options for Application Security:

facility

Specifies the facility category of the logged traffic in Application Security. Select between local0 and local7.

#### filter

Adds, deletes, or replaces a set of request filters in Application Security. You can configure the following options for a request filter:

**key** Specifies a unique key for the request filter. This option is required for the operations create, delete, modify, and replace-all-with. The options are:

##### request-type

Specifies which kind of requests the system, or server, logs.

##### protocol

Specifies whether request logging is dependent on the protocol.

##### response-code

Specifies whether request logging is dependent on the response status code.

##### http-method

Specifies whether request logging is dependent on the HTTP method.

**search-all, search-in-headers, search-in-post-data, search-in-query-string, search-in-request, search-in-uri**  
Specifies whether the request logging is dependent on a specific string, and if so, the part of the request where the system must find the string. You can select only one of these filters, the default is search-all, which means that the system logs all requests, regardless of string.

#### values

Adds, deletes, or replaces a set of values in the request filter.

#### format

Specifies a storage format in Application Security. You can configure the following options for the storage format:

#### field-delimiter

Specifies a field delimiter in the predefined storage format. You may not use the % character. The default delimiter is the comma character, for CSV.

#### field-format

Specifies a field format (for each key/value pair) in the predefined storage format. Use %k for key and %v for value. The default format is empty that is interpreted as "%v", for CSV.

#### fields

Replaces a set of fields in the predefined storage format. The order in the set is important - the server displays the selected traffic items in the log sequentially according to it.

**type** Specifies a type of the storage format. The options are:

##### predefined

Specifies that the log displays only the predefined items you select in the fields.

##### user-defined

Specifies that the log displays any free text that you type in the user-string which can include the predefined items.

#### user-string

Specifies a user string in the user-defined storage format.

#### guarantee-logging

Indicates whether to guarantee local logging in Application Security.

#### guarantee-response-logging

Indicates whether to guarantee local response logging in Application Security. In order to enable it, you must first enable guarantee-logging, and set response-logging to either illegal or all.

#### local-storage

Enables or disables local storage in Application Security.

#### logic-operation

Specifies the logic operation on the associated filters in Application Security. The options are:

**and** Specifies that requests must pass all filters in order for the system, or server, to log the requests.

**or** Specifies that requests must meet at least one filter in order for the system, or server, to log the requests. This is the default value.

#### maximum-entry-length

Specifies the maximum entry length in Application Security. The options are:

1k This is the possible length for remote servers that support the udp protocol.

2k This is the default length for remote servers that support the tcp, udp and tcp-rfc3195 protocols.

10k, 64k  
These are possible lengths for remote servers that support the tcp and udp protocol.

maximum-header-size  
Specifies the maximum headers size in Application Security.

maximum-query-size  
Specifies the maximum query string size in Application Security.

maximum-request-size  
Specifies the maximum request size in Application Security.

name Specifies a dummy name for enabled Application Security. This option is required for the operations create, delete, modify, and replace-all-with.

protocol  
Specifies the protocol supported by the remote server in Application Security. Select either: tcp (the default value), udp, or tcp-rfc3195.

remote-storage  
Specifies a remote storage type in Application Security. The options are:

none Specifies that the system does not store traffic on any remote logging server.

remote  
Specifies that the system stores all traffic on a remote logging server, like a syslog.

splunk  
Specifies that the system stores all traffic on a reporting server (Splunk) using a preconfigured storage format. Key/value pairs are used in the log messages.

arcsight  
Specifies that the system stores all traffic on a remote logging server using the predefined ArcSight settings for the logs. The log messages are in Common Event Format (CEF).

report-anomalies  
Indicates whether to report detected anomalies in Application Security.

response-logging  
Specifies a response logging type in Application Security. The options are:

none Specifies that the system does not log responses. This is the default value.

illegal  
Specifies that the system logs responses to illegal requests.

all Specifies that the system logs all responses if the associated request-type filter has the all value.

servers  
Adds, deletes, or replaces a set of remote servers in Application Security, by specifying an IP address and service port in the format [IPv4:port] or [IPv6.port].

description  
User defined description.

dos-application  
Adds, deletes, or replaces a single DoS (Application) Protection sub-profile. You can configure the following options for DoS (Application) Protection:

local-publisher  
Specifies the name of the local log publisher used for Application DoS attacks. Note: This publisher should have a single local-database destination.

name Specifies a dummy name for enabled DoS (Application) Protection. This option is required for the operations create, delete, modify, and replace-all-with.

remote-publisher  
Specifies the name of the remote log publisher used for Application DoS attacks. Note: This publisher should have arcsight or splunk destinations.

bot-defense  
Adds, deletes, or replaces a single Bot Defense sub-profile. You can configure the following options for Bot Defense:

name Specifies a dummy name for enabled Bot Defense. This option is required for the operations create, delete, modify, and replace-all-with.

#### local-publisher

Specifies the name of the local log publisher used for Bot Defense log messages. Note: This publisher should have a single local-database destination.

#### remote-publisher

Specifies the name of the remote log publisher used for Bot Defense log messages. Note: This publisher should have only splunk destinations.

#### filter

Following options are available which enable or disable the logging of Bot Defense log messages:

#### log-illegal-requests

This option is used to enable or disable the logging of illegal requests.

#### log-challenged-requests

This option is used to enable or disable the logging of challenged requests.

#### log-legal-requests

This option is used to enable or disable the logging of legal requests.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### ip-intelligence

You can configure the following options under this:

#### aggregate-rate

This option is used to set the aggregate rate limit that applies to any ip intelligence log message.

#### log-publisher

Specifies the name of the log publisher used for IP Intelligence events.

#### log-translation-fields

This option is used to enable or disable the logging of translated (i.e server side) fields in IP Intelligence log messages. Translated fields include (but not limited to) Source Address/Port, Destination Address/Port, IP Protocol, Route Domain and Vlan.

#### log-shun

This option is used to enable or disable the logging of shun IP Intelligence events.

#### log-rtbh

This option is used to enable or disable the logging of rtbh IP Intelligence events.

#### log-scrubber

This option is used to enable or disable the logging of scrubber IP Intelligence events.

#### port-misuse

You can configure the following options under this:

#### log-publisher

Specifies the name of the log publisher used for port misuse events.

#### aggregate-rate

This option is used to set the rate limit that applies to any port misuse log messages.

#### traffic-statistics

You can configure the following options under this:

#### log-active-flows

This option is used to enable and disable the logging of number of active flows on client side. The number of flows are logged globally, per virtual server and per route domain periodically if number of active flows increased or decreased.

#### log-publisher

Specifies the name of the log publisher used for Traffic Statistics logs.

#### log-reaped-flows

This option is used to enable and disable the logging of number of reaped flows on client side. The number of flows are logged globally, per virtual server and per route domain periodically if number of active flows increased or decreased.

#### log-missed-flows

This option is used to enable and disable the logging of number of TCP packets (non SYN/ACK) were dropped because of the flow table lookup failed. The number of packets are logged globally, and per route domain periodically.

#### log-syncookies

This option is used to enable and disable the logging of number of syncookies generated, accepted and rejected in the context globally and per virtual server. These log messages will be generated periodically.

#### log-syncookies-whitelist

This option is used to enable and disable the logging of number of syncookies whitelist hits, accepted and rejected in the context globally and per virtual server. These log messages will be generated periodically.

#### network

Add, delete, modify or replace a single Network Security sub-profile. You can configure the following options under this:

#### filter

Following options are available which enable or disable the logging of corresponding Network events:

#### log-acl-match-accept

This option is used to enable or disable the logging of packets that match ACL rules configured with action = Accept or action = Accept Decisively.

#### log-acl-match-drop

This option is used to enable or disable the logging of packets that match ACL rules configured with action = Drop.

#### log-acl-match-reject

This option is used to enable or disable the logging of packets that match ACL rules configured with action = Reject.

#### log-ip-errors

This option is used to enable or disable the logging of IP error packets.

#### log-tcp-errors

This option is used to enable or disable the logging of TCP error packets.

#### log-tcp-events

This option is used to enable or disable the logging of TCP events on client side. Only 'Established' and 'Closed' states of a TCP session are logged if this option is enabled.

#### log-translation-fields

This option is used to enable or disable the logging of translated (i.e server side) fields in ACL match and TCP events. Translated fields include (but not limited to) Source Address/Port, Destination Address/Port, IP Protocol, Route Domain and Vlan.

#### log-geo-always

This option is used to enable or disable the logging of Geographic IP Location information fields in ACL match and TCP logging. Geographic information includes the country code of Source Address and Destination Address.

#### rate-limit

Following options are available to set throttling rate limits for the corresponding logging network events:

#### acl-match-accept

This option is used to set rate limits for the logging of packets that match ACL rules configured with action = Accept or action = Accept Decisively. This option is effective only if logging of this message type is enabled.

#### acl-match-drop

This option is used to set rate limits for the logging of packets that match ACL rules configured with action = Drop. This option is effective only if logging of this message type is enabled.

#### acl-match-reject

This option is used to set rate limits for the logging of packets that match ACL rules configured with action = Reject. This option is effective only if logging of this message type is enabled.

#### ip-errors

This option is used to set rate limits for the logging of IP error packets. This option is effective only if logging of this message type is enabled.

#### tcp-errors

This option is used to set rate limits for the logging of TCP error packets. This option is effective only if logging of this message type is enabled.

#### tcp-events

This option is used to set rate limits for the logging of TCP events on client side. This option is effective only if logging of this message type is enabled.

#### aggregate-rate

This option is used to set the aggregate rate limit that applies to any network logging message.

#### format

Specifies the Storage format in Network Security sub-profile. These settings are only used to format the log messages destined to a Remote Syslog server. You can configure the following options for the storage format:

#### field-list

Specifies a set of fields to be logged. This option is valid when storage format type is field-list. The order in the set is important - the server displays the selected traffic items in the log sequentially according to it. User can pick fields from the following list: acl\_policy\_name, acl\_policy\_type, acl\_rule\_name, action, bigip\_hostname, context\_name, context\_type, date\_time, dest\_fqdn, dest\_geo, dest\_ip, dest\_port, drop\_reason, management\_ip\_address, protocol, route\_domain, sa\_translation\_pool, sa\_translation\_type, source\_fqdn, source\_user, src\_geo, src\_ip, src\_port, translated\_dest\_ip, translated\_dest\_port, translated\_ip\_protocol, translated\_route\_domain, translated\_src\_ip, translated\_src\_port, translated\_vlan, vlan.

#### field-list-delimiter

Specifies the delimiter string in field-list storage format type. The default delimiter is the comma character, for CSV. This option is valid when storage format type is field-list. Special character \$ should not be used in delimiter string as it is reserved for internal usage. Also, the maximum length allowed for field-list-delimiter is 31 characters (excluding NUL terminator).

type Specifies a type of the storage format. The options are:

#### field-list

Specifies that the log displays only the items you specify in the field-list with field-list-delimiter as the delimiter between the items.

none Default format type. With this option, the messages will be logged in the following format:

```
"management_ip_address", "bigip_hostname", "context_type", "context_name", "src_geo", "src_ip", "dest_geo", "dest_ip",
```

#### user-defined

Specifies that the log displays the message as per the user-defined string format.

#### user-defined

Specifies the format of log message in form of user defined string. This option is valid when storage format type is user-defined. Maximum configurable length is 512 characters. Any of the following items, if wrapped within \${ }, will be substituted with the actual value when generating the log: acl\_policy\_name, acl\_policy\_type, acl\_rule\_name, action, bigip\_hostname, context\_name, context\_type, date\_time, dest\_fqdn, dest\_geo, dest\_ip, dest\_port, drop\_reason, management\_ip\_address, protocol, route\_domain, sa\_translation\_pool, sa\_translation\_type, source\_fqdn, source\_user, src\_geo, src\_ip, src\_port, translated\_dest\_ip, translated\_dest\_port, translated\_ip\_protocol, translated\_route\_domain, translated\_src\_ip, translated\_src\_port, translated\_vlan, vlan.

#### publisher

Specifies the name of the log publisher used for Network events.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### partition

Displays the administrative partition within which the component resides.

nat This section is used to configure log settings related to events applicable to firewall NAT feature. Following options are available under this section:

#### end-inbound-session

Event for end of incoming connection to a translated address. Inbound connections are supported only for dynamic-pat source translation. Following options can be configured for logging this event:

#### backup-allocation-only

Enable logging this event when translation is done using backup address in the source translation object configured in dynamic-pat mode. This is only applicable when lsn-legacy-mode is enabled.

#### disabled

Disables logging this event.

#### enabled

Enables logging this event when translation is done using primary address or backup address in the source translation object.

#### errors

Event for errors encountered while attempting source or destination translation.

#### disabled

Disables logging for this event.

enabled

Enables logging for this event.

log-publisher

Specifies the name of log publisher used to log NAT related events to one (or more) remote or local destinations.

lsn-legacy-mode

Specifies whether translation events (and other NAT events) are logged in existing CGNAT/LSN formats (for backward compatibility with LSN events).

quota-exceeded

Event for when client exceeded allocated resource limit.

disabled

Disables logging for this event.

enabled

Enables logging for this event.

rate-limit

Following options are available to set throttling rate limits for the corresponding logging FW NAT events:

aggregate-rate-limit

This option is used to set the aggregate rate for all the FW NAT log events that can be logged per second.

end-inbound-session

This option is used to rate limit the end inbound session log events per second.

end-outbound-session

This option is used to rate limit the end outbound session log events per second.

errors

This option is used to rate limit the errors to be logged per second.

start-inbound-session

This option is used to rate limit the start inbound session log events per second.

start-outbound-session

This option is used to rate limit the start outbound session log events per second.

quota-exceeded

This option is used to rate limit the quota exceeded log events per second.

start-inbound-session

Event for start of incoming connection to a translated address. Inbound connections are supported only for dynamic-pat source translation. Following options can be configured for logging this event:

backup-allocation-only

Enable logging this event when translation is done using backup address in the source translation object configured in dynamic-pat mode.

disabled

Disables logging this event.

enabled

Enables logging this event when translation is done using primary address or backup address in the source translation object.

end-outbound-session

Event for end of outbound translation session, when outbound flow is deleted.

action

Specifies what action is taken at the time of logging the event. Possible options are: backup-allocation-only, disabled and enabled.

elements

Optional elements that can be logged for the event. This is applicable only if lsn-legacy-mode is enabled.

destination

Optional element, if selected, is used to log destination address and port in the applicable log event.

start-outbound-session

Event for start of outbound translation session, when outbound flow is created.

#### action

Specifies what action is taken at the time of logging the event. Possible options are: backup-allocation-only, disabled and enabled.

#### elements

Optional elements that can be logged for the event. This is applicable only if lsn-legacy-mode is enabled.

#### destination

Optional element, if selected, is used to log destination address and port in the applicable log event.

#### protocol-dns

Add, delete, modify or replace a single Protocol (DNS) Security sub-profile. You can configure the following options under this:

#### filter

Following options are available which enable or disable the logging of corresponding Network events:

#### log-dns-drop

This option is used to enable or disable the logging of dropped DNS packets.

#### log-dns-filtered-drop

This option is used to enable or disable the logging of DNS packets that are dropped due to filtering.

#### log-dns-malformed

This option is used to enable or disable the logging of malformed DNS packets.

#### log-dns-malicious

This option is used to enable or disable the logging of malicious DNS packets.

#### log-dns-reject

This option is used to enable or disable the logging of rejected DNS packets.

#### format

Specifies the Storage format in Protocol (DNS) Security sub-profile. These settings are only used to format the log messages destined to a Remote Syslog server. You can configure the following options for the storage format:

#### field-list

Specifies a set of fields to be logged. This option is valid when storage format type is field-list. The order in the set is important - the server displays the selected traffic items in the log sequentially according to it. User can pick fields from the following list: action, attack\_type, context\_name, date\_time, dest\_ip, dest\_port, dns\_query\_name, dns\_query\_type, src\_ip, src\_port, vlan.

#### field-list-delimiter

Specifies the delimiter string in field-list storage format type. The default delimiter is the comma character, for CSV. This option is valid when storage format type is field-list. Special character \$ should not be used in delimiter string as it is reserved for internal usage. Also, the maximum length allowed for field-list-delimiter is 31 characters (excluding NUL terminator).

type Specifies a type of the storage format. The options are:

#### field-list

Specifies that the log displays only the items you specify in the field-list with field-list-delimiter as the delimiter between the items.

none Default format type. With this option, the messages will be logged in the following format:

```
"date_time", "context_name", "vlan",  
"dns_query_type", "dns_query_name", "attack_type",  
"action", "src_ip", "dest_ip", "src_port",  
"dest_port", "route_domain"
```

#### user-defined

Specifies that the log displays the message as per the user-defined string format.

#### user-defined

Specifies the format of log message in form of user defined string. This option is valid when storage format type is user-defined. Maximum configurable length is 512 characters. Any of the following items, if wrapped within \${ }, will be substituted with the actual value when generating the log: action, attack\_type, context\_name, date\_time, dest\_ip, dest\_port, dns\_query\_name, dns\_query\_type, route\_domain, src\_ip, src\_port, vlan.

name Specifies a dummy name for enabled Protocol (DNS) Security. This option is required for the operations create, delete, modify, and replace-all-with.

#### publisher

Specifies the name of the log publisher used for DNS events.

protocol-dns-dos-publisher

Specifies the name of the log publisher used for DNS DoS events.

dos-network-publisher

Specifies the name of the log publisher used for DoS Network events.

protocol-sip

Add, delete, modify or replace a single Protocol (SIP) Security sub-profile. You can configure the following options under this:

filter

Following options are available which enable or disable the logging of corresponding protocol sip events:

log-sip-drop

This option is used to enable or disable the logging of dropped SIP packets.

log-sip-global-failures

This option is used to enable or disable the logging of SIP packets that resulted in global failures.

log-sip-malformed

This option is used to enable or disable the logging of malformed SIP packets.

log-sip-redirectation-responses

This option is used to enable or disable the logging of SIP packets that resulted in sending redirection response.

log-sip-request-failures

This option is used to enable or disable the logging of SIP request failures.

log-sip-server-errors

This option is used to enable or disable the logging of SIP packets that resulted in server errors.

format

Specifies the Storage format in Protocol (SIP) Security sub-profile. These settings are only used to format the log messages destined to a Remote Syslog server. You can configure the following options for the storage format:

field-list

Specifies a set of fields to be logged. This option is valid when storage format type is field-list. The order in the set is important - the server displays the selected traffic items in the log sequentially according to it. User can pick fields from the following list: action, attack\_type, context\_name, date\_time, dest\_ip, dest\_port, dns\_query\_name, dns\_query\_type, src\_ip, src\_port, vlan.

field-list-delimiter

Specifies the delimiter string in field-list storage format type. The default delimiter is the comma character, for CSV. This option is valid when storage format type is field-list. Special character \$ should not be used in delimiter string as it is reserved for internal usage. Also, the maximum length allowed for field-list-delimiter is 31 characters (excluding NUL terminator).

type Specifies a type of the storage format. The options are:

field-list

Specifies that the log displays only the items you specify in the field-list with field-list-delimiter as the delimiter between the items.

none Default format type. With this option, the messages will be logged in the following format:

```
"date_time", "context_name", "vlan",  
"sip_method_type", "sip_caller", "sip_callee",  
"attack_type", "action", "src_ip", "dest_ip",  
"src_port", "dest_port", "route_domain"
```

user-defined

Specifies that the log displays the message as per the user-defined string format.

user-defined

Specifies the format of log message in form of user defined string. This option is valid when storage format type is user-defined. Maximum configurable length is 512 characters. Any of the following items, if wrapped within \${ }, will be substituted with the actual value when generating the log: action, attack\_type, context\_name, date\_time, dest\_ip, dest\_port, dns\_query\_name, dns\_query\_type, route\_domain, src\_ip, src\_port, vlan.

name Specifies a dummy name for enabled Protocol (SIP) Security. This option is required for the operations create, delete, modify, and replace-all-with.

publisher

Specifies the name of the log publisher used for SIP events.

`protocol-sip-dos-publisher`  
Specifies the name of the log publisher used for SIP DoS events.

`protocol-transfer`  
Adds, deletes, or replaces a single Protocol (Transfer) Security sub-profile. You can configure the following options for Protocol (Transfer) Security:

`name` Specifies a dummy name for enabled Protocol (Transfer) Security. This option is required for the operations create, delete, modify, and replace-all-with.

`publisher`  
Specifies the name of the log publisher used for Protocol Security log messages. Note: This publisher should have either local-database, local-syslog, remote-syslog, arcsight or splunk single destination.

`regex`  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

## security log protocol-dns-storage-field

**NAME**  
`protocol-dns-storage-field` - Lists the available storage format fields that can be used in the context of Protocol DNS Security Logging.

**MODULE**  
security log

**SYNTAX**  
Retrieve the list of the `protocol-dns-storage-field` values using the syntax shown in the following sections.

**DISPLAY**  
`list protocol-dns-storage-field`  
`list protocol-dns-storage-field [ [ [name] | [glob] | [regex] ] ... ]`  
options:  
all  
all-properties  
one-line  
app-service

**DESCRIPTION**  
Use this command to display the possible values of the `protocol-dns-storage-field` object to be used in the context of Protocol DNS Security Logging. These possible values are predefined traffic items available for the server to log in the context of DNS event logging (for example, Malformed, Malicious, or Dropped DNS packets).

**EXAMPLES**  
`list protocol-dns-storage-field`  
  
Displays all the storage fields supported by Protocol DNS Security Logging.

**OPTIONS**  
`app-service`  
Displays the application service to which the object belongs. The default value is none. Note: If the `strict-updates` option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

## security log protocol-sip-storage-field

**NAME**  
protocol-sip-storage-field - Lists the available storage format fields that can be used in the context of Protocol SIP Security Logging.

**MODULE**  
security log

**SYNTAX**  
Retrieve the list of the protocol-sip-storage-field values using the syntax shown in the following sections.

**DISPLAY**  
list protocol-sip-storage-field  
list protocol-sip-storage-field [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all  
all-properties  
one-line  
app-service

**DESCRIPTION**  
Use this command to display the possible values of the protocol-sip-storage-field object to be used in the context of Protocol SIP Security Logging. These possible values are predefined traffic items available for the server to log in the context of SIP event logging (e.g Dropped SIP packets).

**EXAMPLES**  
list protocol-sip-storage-field  
  
Displays all the storage fields supported by Protocol SIP Security Logging.

**OPTIONS**  
app-service  
Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

**SEE ALSO**

## security log remote-format

**NAME**  
remote-format - Lists the log format for different remote destinations (such as ArcSight, Splunk etc.) used by various Firewall events (such as Network, IP Intelligence, DoS etc.).

**MODULE**  
security log

**SYNTAX**

Retrieve the list of the remote-format using the syntax shown in the following sections.

```
DISPLAY
list remote-format
list remote-format [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  all-properties
  app-service
  format
  one-line
```

**DESCRIPTION**  
Use this command to display the actual log format used to send firewall event logs to remote destinations such as ArcSight, Splunk and Syslog. These log formats are used by the log destinations of log publisher configured in different sub-profiles (for example Network, IP Intelligence, DNS, DNS DoS etc.) of a security log profile.

**EXAMPLES**

```
list remote-format

Displays the log format for all firewall events.

list remote-format network-arcsight

Displays the format for Network log events (such as ACL matches, TCP events etc.) sent to an ArcSight destination.

list remote-format network-dos-splunk

Displays the format for Network DoS log events sent to a Splunk destination.

list remote-format ip-intelligence-syslog-default

Displays the format for IP Intelligence log events sent to a remote syslog destination.
```

**OPTIONS**

**app-service**  
Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

**format**  
Displays the remote log format used by the object.

**SEE ALSO**  
glob, list, regex, security log profile, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2009-2013. All rights reserved.

BIG-IP 2013-02-20 security log remote-format(1)

---

## security log storage-field

**NAME**  
storage-field - Lists the available storage format fields that can be used in the context of Application Security Logging.

**MODULE**  
security log

**SYNTAX**  
Retrieve the list of the storage-field values using the syntax shown in the following sections.

```
DISPLAY
list storage-field
list storage-field [ [ [name] | [glob] | [regex] ] ... ]
options:
  all
  app-service
  format
  id
  one-line
```

**DESCRIPTION**  
Use this command to display the possible values of the storage-field object to be used in the context of Application Security Logging. These

possible values are predefined traffic items available for the server to log. The traffic items appear in the final format string as arguments in the printf() function, i.e. "%\$", therefore each storage field has its fixed format (specifier) and id (position).

#### EXAMPLES

```
list storage-field
```

Displays all the storage fields supported by Application Security Logging.

#### OPTIONS

```
app-service
```

Displays the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

```
format
```

Displays a format of the field (s - string, d - decimal). It corresponds to the conversion specifier in the printf() function.

```
id
```

Displays an order ID of the field (starting from 1). It corresponds to the position in the argument list of the desired argument in the printf() function.

#### SEE ALSO

#### DESCRIPTION

A destination-translation NAT object is a set of IP Address(es) and port numbers that the BIG-IP system uses as public-side addresses and ports. When this object is assigned to a Security NAT Policy rule (which is associated to a virtual server), any incoming traffic to this virtual server that matches the rule, will have their private destination addresses (and/or ports) translated to a public address and/or port from this destination-translation object.

#### EXAMPLES

```
create destination-translation d1 type static-pat addresses add {
10.10.10.0/24 } ports add { 7000-8000 }
```

Creates the destination-translation object d1 that contains the translation addresses in the range of 10.10.10.0/24, translation port range 7000-8000 and uses static-pat as the translation algorithm.

```
delete destination-translation d1
```

Deletes the destination-translation named d1.

#### OPTIONS

##### addresses

Specifies the set of translation IP addresses available. This is a collection of either one (or more) IP Address, one (or more) IP prefixes with their prefix lengths and/or IP Address range. All public-side (destination) addresses come from the subnets you enter in this property.

##### app-service

Specifies the name of the application service to which this object belongs. The default value is none.

Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this object. Only the application service can modify or delete this object.

##### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the destination-translation component. This option is required for the commands create, delete, and modify.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

##### ports

Specifies the range of port numbers available for use with translation IP addresses.

type Specifies which kind of translation is performed. Available options are static-nat and static-pat.

##### static-nat

Using this translation type in the destination-translation, only (destination) IP Address translation is performed (and no port translation) for the incoming client traffic that matches the NAT Policy Rule using this translation object. There is a static (pre-defined) 1:1 mapping between the untranslated IP Address(es) and the translated IP Address(es) specified in this object.

##### static-pat

Using this translation type in the destination-translation, (destination) port translation is performed for the incoming client traffic that matches the NAT Policy Rule using this translation object. There is a static (pre-defined) 1:1 mapping between the untranslated port(s) and the translated port(s) specified in this object. In addition, if translation address(es) are specified in the destination-translation, it also performs IP Address translation (in the same fashion as done for static-nat).

## security nat policy

**NAME**  
policy - Configures nat policy.

**MODULE**  
security nat

**SYNTAX**  
Modify the policy component within the security nat module using the syntax shown in the following sections.

```
CREATE/MODIFY
create policy [name]
modify policy [name]
options:
  app-service [[string] | none]
  description [string]
  rules [add | delete | modify | replace-all-with] {
    [ [name] ] {
      options:
        app-service [[string] | none]
        description [string]
        ip-protocol [protocol name]
        log-profile [name | none]
        place-after [first | last | [rule name]]
        place-before [first | last | [rule name]]
        status [disabled | enabled]
        destination {
          address-lists [add | default | delete | replace-all-with] {
            [address list names...]
          }
          address-lists none
          addresses [add | default | delete | replace-all-with] {
            [ [ip address] | [ip address/prefixlen] ]
          }
          addresses none
          port-lists [add | default | delete | replace-all-with] {
            [port list names...]
          }
          port-lists none
          ports [add | default | delete | none | replace-all-with] {
            [ [port] | [port1-port2] ]
          }
          ports none
        }
      source {
        address-lists [add | default | delete | replace-all-with] {
          [address list names...]
        }
        address-lists none
        addresses [add | default | delete | replace-all-with] {
          [ [ip address] | [ip_address/prefixlen] ]
        }
        addresses none
        port-lists [add | default | delete | replace-all-with] {
          [port list names...]
        }
        port-lists none
        ports [add | default | delete | replace-all-with] {
          [ [port] | [port1-port2] ]
        }
        ports none
        vlans [add | default | delete | replace-all-with] {
          [vlan names...]
        }
        vlans none
      }
      translation {
        destination [name | none]
        source [name | none]
      }
    }
  }
  rules none
```

```
edit policy
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list policy
show running-config policy
options:
  all-properties
  non-default-properties
  one-line
```

**DESCRIPTION**  
You can use the policy component to configure a shareable and reusable set of nat rules which can be associated with a number of configuration objects of the following types: ltm virtual, security device-context, net route-domain.

**EXAMPLES**  
create policy p1 rules add {  
r1 {

```

place-before first
ip-protocol tcp
source {
  addresses replace-all-with { 192.168.10.0/24 }
  ports replace-all-with { 10000-19999 }
}
destination {
  addresses replace-all-with { 10.10.10.0/24 }
  ports replace-all-with { 80 443 }
}
translation {
  destination my_dest_nat
  source my_src_nat
}
}
}

```

Creates a rule entry at the beginning of the policy that matches incoming TCP traffic with source address in the range 192.168.10.0/24, source port in the range 10000-19999, destination address in the range 10.10.10.0/24, destination port 80 or 443 and if matches, performs the source translation as per source-translation object named my\_src\_nat and destination translation as per destination-translation object named my\_dest\_nat.

```
modify policy p1 rules delete r1
```

Removes the rule r1 from the policy p1.

```
list policy
```

Displays the current list of policy rules.

#### OPTIONS

```
description
User defined description.
```

```
rules
Adds, deletes, or replaces a NAT rule.
```

```
description
User defined description.
```

```
destination
address-lists
Specifies a list of address lists (see security firewall
address-list) against which the packet will be compared.
```

```
addresses
Specifies a list of addresses and networks against which
the packet will be compared.
```

```
port-lists
Specifies a list of port lists (see security firewall
port-list) against which the packet will be compared.
```

```
ports
Specifies a list of ports and port ranges against which
the packet will be compared.
```

```
ip-protocol
Specifies the IP protocol against which the packet will be
compared.
```

```
log-profile
Specifies the name of the log profile (see security log
profile) that is used to log the translation events triggered
by this NAT rule.
```

```
place-after
Specifies that a new rule should be placed after another
rule, first or last. If individual rules are being added (as
opposed to specifying replace-all-with) then place-before or
place-after must be specified.
```

```
place-before
Specifies that a new rule should be placed before another
rule, first or last. If individual rules are being added (as
opposed to specifying replace-all-with) then place-before or
place-after must be specified.
```

```
source
address-lists
Specifies a list of address lists (see security firewall
address-list) against which the packet will be compared.
```

```
addresses
Specifies a list of addresses and networks against which
the packet will be compared.
```

```
port-lists
Specifies a list of port lists (see security firewall
port-list) against which the packet will be compared.
```

```
ports
Specifies a list of ports and port ranges against which
the packet will be compared.
```

```
vlan
Specifies a list of vlans, vlan groups and tunnels
against which the packet will be compared.
```

```
status
Specifies whether the rule is enabled or disabled. A rule
that is enabled is always checked. A rule that is disabled is
```

never checked.

translation  
Specifies the translation objects.

destination  
Specifies the name of destination translation object (see security nat destination-translation). If specified, it is used to perform the destination address/port translation as per its settings. If not specified, the matching traffic's destination address/port are not translated.

source  
Specifies the name of source translation object (see security nat source-translation). If specified, it is used to perform the source address/port translation as per its settings. If not specified, the matching traffic's source address/port are not translated.

#### DESCRIPTION

A source-translation NAT object is a set of IP Address(es) and port numbers that the BIG-IP system uses as public-side addresses and ports. When this object is assigned to a Security NAT Policy rule (which is associated to a virtual server), any incoming traffic to this virtual server that matches the rule, will have their private source addresses (and/or ports) translated to a public address and/or port from this source-translation object.

#### EXAMPLES

```

create source-translation s1 type dynamic-pat pat-mode napt mapping {
mode endpoint-independent-mapping timeout 600 } addresses add {
10.10.20.0/24 } ports add { 4000-5000 } client-connection-limit 100

```

Creates the source-translation object named s1 that contains the translation addresses in the range of (addresses) 10.10.20.0/24, translation port range 4000-5000, with a client connection limit of 100 connections per client. The translated address and port are persisted for 600 seconds. This object operates in NAPT mode (Network Address and Port Translation mode), which is the default mode if not specified when type is dynamic-pat.

```

delete source-translation s1

```

Deletes the source-translation object named s1.

#### OPTIONS

##### app-service

Specifies the name of the application service to which this object belongs. The default value is none.

Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete this object. Only the application service can modify or delete this object.

##### addresses

Specifies the set of translation IP addresses available in the pool. This is a collection of IP prefixes with their prefix lengths. All public-side addresses come from the subnets you enter in this property.

##### backup-addresses

Specifies translation IP addresses available in the backup pool which is used by DNAT translation mode if DNAT mode translation fails and falls back to NAPT mode. This is a collection of IP prefixes with their prefix lengths.

##### client-connection-limit

The maximum number of simultaneous translated connections a client or subscriber is allowed to have. This attribute is applicable only if type is set to dynamic-pat.

##### description

User defined description.

##### egress-interfaces

The set of interfaces on which the source address translation is allowed or disallowed. If egress-interfaces-enabled is specified, the source address translation is allowed only on the specified set of interfaces. If egress-interfaces-disabled is specified, source address translation is disabled on specified interfaces.

##### egress-interfaces-disabled

Source address translation is not allowed on the interfaces specified in the egress-interfaces set.

##### egress-interfaces-enabled

Source address translation is allowed on the interfaces specified in the egress-interfaces set.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### hairpin-mode

This attribute is applicable only if type is set to dynamic-pat.

Enable or disable hairpinning for incoming connections.

When a client sends a packet to another client in the same private network, hairpin mode sends the packet directly to the source client's private address; the BIG-IP system immediately translates the packet's public-side source address. Rather than going out to the public network and coming back later for translation, the packet takes a hairpin turn at the BIG-IP device.

icmp-echo

Enable or disable ICMP echo on translated addresses.

inbound-mode

This attribute is applicable only if type is set to dynamic-pat.

Modifies the inbound-connection mode for incoming connections to translation endpoints. A translation endpoint is the public-side address and port (X':x') for a private-side address (X:x). You can allow one of the following two algorithms for managing inbound connections:

endpoint-independent-filtering

creates inbound mappings automatically from outbound traffic and allows inbound connections. Consider an outbound mapping from X:x to X':x'. If a connection comes from X:x through X':x', the BIG-IP system automatically creates a reverse mapping from X':x' back to X:x. A public-side station can respond through the X':x' address. This allows the BIG-IP system to provide Endpoint Independent Filtering (EIF) as defined in section 5 of RFC 4787

().

explicit

Allows inbound connections if and only if there exists an inbound mapping to translate public-side source address X':x' to client's private address X:x. Users can create Inbound mappings via iRules or PCP.

none disables inbound connections to translation end-points (X':x'). If there is a mapping of X (a private-side IP address) to X' (a public-side IP), connections can only go out from X through X'. If a public-side recipient tries to answer at the client's public-side X' address, the BIG-IP system does not map X' back to X. The inbound connection never happens.

Port Control Protocol (PCP) is not supported if you use this setting.

pat-mode

Specifies which kind of translation address mapping is performed when type is specified as dynamic-pat. Available options are NATP, Deterministic, and PBA.

NAPT (Network Address Port Translation) assigns translation addresses and ports in round-robin fashion. The algorithm first cycles through translation addresses and then through translation ports.

Deterministic

(DNAT) is a reversible translation method. A given client address and port always translates to a particular public address and port from the source-translation pool. This method has the following restrictions:

it is only available for NAT44 translations, it does not support connections through DS-Lite tunnels, subscriber connections must be received over a VLAN with the property, cmp-hash, set to "source ip," the egress to the Internet must be over a VLAN with the property, cmp-hash, set to "dest ip," any security NAT rule ("security nat policy") that uses this must have a source property set to an IP prefix containing fewer than 231 addresses. For example, the source cannot be 0.0.0.0/0.

PBA (Port Block Allocation) assigns 'blocks' of the translation addresses and ports to individual clients. All client connections are restricted to the allocated port blocks. Only block allocations and deallocations are logged in order to reduce the volume of logs.

subscriber connections must be received over a VLAN with the property, cmp-hash, set to "source ip," the egress to the Internet must be over a VLAN with the property, cmp-hash, set to "dest ip,"

You can access your VLAN configurations through the "net vlan" component. You can find the VLANs used by your virtual server by showing or listing the "ltm virtual" component.

name Specifies a unique name for the source-translation component. This option is required for the commands create, delete, and modify.

mapping

These settings are applicable only if type is set to dynamic-pat.

Configure the mapping settings for translation entries. It is the preservation of a public-side IP address for a client from session to session.

mapping.mode

Configure the mapping mode for translation entries. You can enter address-pooling-paired, endpoint-independent-mapping, or none.

**address-pooling-paired**  
causes the BIG IP software to attempt to keep the IP address persistent but not necessarily the port. If a client's private IP address:port combination is X:x, it's public-side address may be X'a in one session, X'b in the next session, X'c in a third session, and so on.

**endpoint-independent-mapping**  
causes the BIG IP software to attempt to keep the IP address and port persistent. If a client's private IP address:port combination is X:x, and it's public-side address is X'x' in the first session, it remains X'x' in all future sessions.

This is called "Endpoint Independent Mapping" in RFC 4787 ().

This is the only supported setting for PCP, which you configure with the `pcp` property.

**none** prevents the BIG IP software from attempting any IP address or port mapping. An address:port combination of X:x is never guaranteed to have the same public-side address or port in two sessions.

**mapping.timeout**  
After the most-recent session where address:port X:x translated to X'x' on the public side, a timer begins. If the timer expires before X:x has another session, X' or x' may be used as the public side of another address:port. Use this parameter to set the timeout (in seconds) for address and port mapping.

**pcp** A Port Control Protocol (PCP) client can set (or at least learn) its own translation (public-side) IP address and/or port. It can also set the address and/or port of a third-party client. PCP is defined in RFC 6887 (see ).

**pcp.profile**  
Specifies the PCP profile to use for this LSN pool. This PCP profile defines the settings to use for communication with PCP clients. Use the `create ltm profile pcp` command to create a new PCP profile.

PCP requires a profile (defined with this property) and either a `pcp.selfip` or a `pcp.dslite` tunnel where clients can send their PCP requests.

If you remove this profile option, you must specifically remove any `pcp.selfip` or `pcp.dslite` tunnel, too.

**pcp.selfip**  
Specifies the PCP Server self-IP address for this LSN pool. The virtual server's clients send their PCP packets to this address. Use the `create net self` command to create a self-IP address, then use that address for this parameter. Choose a self-IP address in a VLAN that is reachable by the virtual server's clients.

**pcp.dslite**  
Specifies a DS-LITE tunnel for PCP packets. Whenever a client sends a PCP packet through this tunnel, the BIG-IP device uses the PCP profile you choose with the `pcp.profile` property.

A DS-LITE tunnel places each IPv4 packet into the payload of an IPv6 packet. The IPv6 packet carries the IPv4 packet between customer equipment and the BIG-IP system, which then removes the IPv4 packet, uses NAT to translate its IPv4 addresses, and sends it to its destination.

You cannot use this property if the `pat-mode` property is set to `Deterministic`.

**port-block-allocation**  
Configures the port block settings for PBA mode.

**port-block-allocation.block-idle-timeout**  
Configures the time after the last connection using the block is freed that the block assignment expires. The default value is 3600 seconds.

**port-block-allocation.block-lifetime**  
Configures the timeout after which the block is no longer used for new port allocations. The block becomes a zombie block. The default is 0 which corresponds to an infinite timeout.

**port-block-allocation.block-size**  
Configures the number of ports in a block. The default value is 64.

**port-block-allocation.client-block-limit**  
Configures the number of blocks that can be assigned to a single subscriber IP address. The default value is 1.

**port-block-allocation.zombie-timeout**  
Configures the timeout after which connections using the zombie block are killed. After connections are killed zombie block is freed after `port-block-allocation.block-idle-timeout`. This parameter is unused unless the `port-block-allocation.block-lifetime` is set. The default value is 0 which corresponds to infinite timeout.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help`

regex for a description of regular expression syntax.

**ports**  
Specifies the range of port numbers available for use with translation IP addresses.

**route-advertisement**  
Enable or Disable Route Advertisement for the translated source IP addresses.

**type** Specifies which kind of translation is performed. Available options are: static-nat, static-pat, and dynamic-pat.

**dynamic-pat**  
Using this type, BigIP translates a group of private (internal) IP Addresses to a pool of (one or more) public (external) IP Addresses and also translates ports to reuse the pool of public addresses. BigIP supports 3 different modes for dynamic-pat which can be specified using option pat-mode as described above.

**static-nat**  
Using this translation type in the source-translation, only (source) IP Address translation is performed (and no port translation) for the incoming client traffic that matches the NAT Policy Rule using this translation object. There is a static (pre-defined) 1:1 mapping between the untranslated IP Address(es) and the translated IP Address(es) specified in this object (i.e same translation address (X') is used for all connections originating from the client with untranslated address (X)).

**static-pat**  
Using this translation type in the source-translation, (source) port translation is performed for the incoming client traffic that matches the NAT Policy Rule using this translation object. There is a static (pre-defined) 1:1 mapping between the untranslated port(s) and the translated port(s) specified in this object. In addition, if translation address(es) are specified in the source-translation, it also performs IP Address translation (in the same fashion as done for static-nat).

## security scrubber dwbl-scrubber-category-stats

**NAME**

dwbl-scrubber-category-stats - Show the list of IPs that are associated with a scrubbed category.

**MODULE**

security scrubber

**SYNTAX**

show dwbl-scrubber-category-stats

**DESCRIPTION**

You can use the dwbl-scrubber-category-stats component to display the list of IPs that are associated with a scrubbed category.

**EXAMPLES**

show security scrubber dwbl-scrubber-category-stats category-name [name] profile-name scrubber-profile-default

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## security scrubber dwbl-scrubber-stat

**NAME**  
dwbl-scrubber-stat - Show scrubber's Dwbl related stats.

**MODULE**  
security scrubber

**SYNTAX**  
show dwbl-scrubber-stat

**DESCRIPTION**  
You can use the dwbl-scrubber-stat component to display the threshold, observed rate, under attack, time to live, and expire time for each monitor. Each row displays stats related per a monitor. Scrubber module monitors selected virtual servers, categories, and route domains.

**EXAMPLES**  
show security scrubber dwbl-scrubber-stat

**COPYRIGHT**

---

## security scrubber profile

**NAME**  
profile - Configures a scrubber profile for use by firewall. A scrubber-profile-default specifies monitors and method (how and where) to be monitored and scrubbed.

**MODULE**  
security scrubber

**SYNTAX**  
Configure the scrubber-profile-default component within the security scrubber profile module using the syntax in the following sections.

**MODIFY**  
modify profile [name]

**options:**

```
advertisement-ttl [integer]
scrubber-categories action [add | delete | modify | none |
replace-all-with] {
  [name] { advertisement-method [bgp-method | none-method |
silverline-method] | blacklist-category [string] | next-hop [IPv4
address] | next-hop-v6 [IPv6 address] | route-domain-name [string] |
app-service [[string] | none]}
}
scrubber-rt-domain action [add | delete | modify | none |
replace-all-with] {
  [name] { absolute-threshold [integer] | advertisement-method
[bgp-method | none-method | silverline-method] next-hop [IPv4 address]
next-hop-v6 [IPv6 address] | percentage-threshold [integer] | route-
domain [string] |
scrubber-rd-network-prefix action [add | delete | modify |
none | replace-all-with] {
  [name] { dst-ip [IP address] | mask [integer] | next-hop
[IP address] | app-service [[string] | none] }
}
}
scrubber-virtual-server action [add | delete | modify | none |
replace-all-with] {
  [name] { absolute-threshold [integer] | advertisement-method
[bgp-method | none-method | silverline-method] | next-hop [IP address]
| percentage-threshold [integer] | vs-name [string] app-service
[[string] | none]}
}
silverline { url [string] user-id [string] user-passwd [string] }
app-service [[string] | none]
```

```
list profile [[name] | all | [property]]
show running-config profile [[name] | all | [property]]
options:
  all-properties
  non-default-properties
  one-line
  recursive
```

#### OPTIONS

**app-service**  
Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

**description**  
User defined description.

**advertisement-ttl**  
Defines the scrubbing duration for all monitored entities in seconds.

**scrubber-categories**  
Defines how a blacklist-category to be scrubbed.

#### OPTIONS

**advertisement-method**  
Defines a method to use to scrub a blacklist-category.

**blacklist-category**  
Identifies a blacklist-category to be scrubbed.

**next-hop**  
Defines the nexthop to be used for scrubbing/redirecting traffic for IPv4 shuns.

**next-hop-v6**  
Defines the nexthop to be used for scrubbing/redirecting traffic for IPv6 shuns.

**route-domain-name**  
Identifies a route-domain to be used for route advertisement.

#### OPTIONS

**absolute-threshold**  
Defines bandwidth threshold which triggers scrubbing for selected route domain.

**advertisement-method**  
Defines a method to use to scrub a route domain.

**percentage-threshold**  
Defines bandwidth threshold which triggers scrubbing for selected route domain. The percentage is calculate based on route-domain bandwidth value.

**next-hop**  
Defines the nexthop to be used for scrubbing/redirecting IPv4 traffic.

**next-hop-v6**  
Defines the nexthop to be used for scrubbing/redirecting IPv6 traffic.

**route-domain-name**  
Identifies a route-domain to be used for route advertisement.

**scrubber-rd-network-prefix**  
Defines subnets which to be used for scrubbing/redirecting traffic. If is defined than the scrubbing for parent route-domain would be ignored.

#### OPTIONS

**dst-ip**  
Defines subnet to be used for redirection.

**mask**  
Defines subnet mask to be used for redirection.

**next-hop**  
Defines the nexthop to be used for scrubbing/redirecting traffic.

**app-service**  
Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

**scrubber-virtual-server**  
Defines how and when a virtual server to be scrubbed.

#### OPTIONS

**absolute-threshold**  
Defines a bandwidth threshold which triggers scrubbing for a selected virtual server.

**advertisement-method**  
Defines a method to use to scrub a virtual server.

**percentage-threshold**  
Defines bandwidth threshold which triggers scrubbing for selected

route domain. The percentage is calculate based on defined virtual server bandwidth value.

**next-hop**  
Defines the nexthop to be used for scrubbing/redirection traffic.

**vs-name**  
Identifies a virtual server to be used for route advertisement.

**app-service**  
Specifies the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the Application Service that owns the object, you cannot modify or delete the object. Only the Application Service can modify or delete the object.

#### OPTIONS

**url**  
Used to communicate with Silverline system.

**user-id**  
Defines silverline user's user identification.

**user-passwd**  
Defines silverline user's password.

#### COPYRIGHT

## security scrubber unredirect

**NAME**  
unredirect - Stop scrubbing for a monitored entity. A unredirect command enables a user to stop redirection(scrubbing) for a selected monitored entity such as category, virtual server, or route domain.

**MODULE**  
security scrubber

**SYNTAX**  
Configure the redirect component within the security scrubber module using the syntax shown in the following sections.

**RUN**  
run security scrubber unredirect  
options:  
profile [scrubber-profile-default]  
unredirect-category [string]  
unredirect-route-domain [string]  
unredirect-virtual-server [string]

**DESCRIPTION**  
You can use the unredirect component to stop traffic redirection (scrubbing) for a selected monitored entity.

**EXAMPLES**  
run security scrubber unredirect scrubber-profile scrubber-profile-default unredirect-category  
run security scrubber unredirect scrubber-profile scrubber-profile-default unredirect-virtual-server  
run security scrubber unredirect scrubber-profile scrubber-profile-default unredirect-route-domain

---

## security ssh profile

NAME  
profile - Configures ssh profile.

MODULE  
security ssh

SYNTAX  
Modify the profile component within the security ssh module using the syntax shown in the following sections.

CREATE/MODIFY

```
create profile [name]
modify profile [name]
options:
  description [string]
  rules [add | delete | modify | replace-all-with] {
    [ [name] ] {
      options:
    actions [add | delete | modify] {
      [ [name] ] {
        shell-action { control [allow | disallow | terminate] log [no | yes] }
        sub-system-action { control [allow | disallow | terminate] log [no | yes] }
        sftp-up-action { control [allow | disallow | terminate] log [no | yes] }
        sftp-down-action { control [allow | disallow | terminate] log [no | yes] }
        scp-up-action { control [allow | disallow | terminate] log [no | yes] }
        scp-down-action { control [allow | disallow | terminate] log [no | yes] }
        rexec-action { control [allow | disallow | terminate] log [no | yes] }
        local-forward-action { control [allow | disallow | terminate] log [no | yes] }
        remote-forward-action { control [allow | disallow | terminate] log [no | yes] }
        x11-forward-action { control [allow | disallow | terminate] log [no | yes] }
        agent-action { control [allow | disallow | terminate] log [no | yes] }
        other-action { control [allow | disallow | terminate] log [no | yes] }
      }
    }
  }
  description [string]
  identity-users [add | delete | replace-all-with] {
    [identity user list names...]
  }
  identity-groups [add | delete | replace-all-with] {
    [identity group list names...]
  }
}
}
rules none
actions [add | delete | modify] {
  [ [name] ] {
    options:
    shell-action { control [allow | disallow | terminate] log [no | yes] }
    sub-system-action { control [allow | disallow | terminate] log [no | yes] }
    sftp-up-action { control [allow | disallow | terminate] log [no | yes] }
    sftp-down-action { control [allow | disallow | terminate] log [no | yes] }
    scp-up-action { control [allow | disallow | terminate] log [no | yes] }
    scp-down-action { control [allow | disallow | terminate] log [no | yes] }
    rexec-action { control [allow | disallow | terminate] log [no | yes] }
    local-forward-action { control [allow | disallow | terminate] log [no | yes] }
    remote-forward-action { control [allow | disallow | terminate] log [no | yes] }
    x11-forward-action { control [allow | disallow | terminate] log [no | yes] }
    agent-action { control [allow | disallow | terminate] log [no | yes] }
    other-action { control [allow | disallow | terminate] log [no | yes] }
  }
}
auth-info [add | delete | modify] {
  [ [name] ] {
    options:
    proxy-server-auth {
      private-key [string]
      public-key [string]
    }
    proxy-client-auth {
      private-key [string]
      public-key [string]
    }
    real-server-auth {
      public-key [string]
    }
  }
}
}
timeout [integer]
```

```
edit profile
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list profile
show running-config profile
options:
  all-properties
  non-default-properties
  one-line
```

DESCRIPTION  
You can use the profile component to configure a shareable and reusable set of ssh profile rules.

EXAMPLES  
create profile profile1 auth-info add {  
auth1 {  
 proxy-server-auth {  
 private-key "abcd"  
 public-key "1234" }  
}}

```

}
proxy-client-auth {
  private-key "efgh"
  public-key "5678"
}
}
}

```

Creates a ssh profile with auth-info of client facing auth and server facing auth.

```

modify profile profile1 actions add {
action1 {
  sftp-up-action {
    control disallow log yes
  }
  shell-action {
    control terminate log yes
  }
}
}
}

```

Modify existing profile by adding default actions of shell action and sftp action.

```

modify profile profile1 rules add {
rule1 {
  actions add {
    action1 {
      sftp-up-action {
        control disallow log yes
      }
      shell-action {
        control terminate log yes
      }
    }
  }
  identity-groups add {
    "grp1" "grp2"
  }
  identity-users add {
    "usr1" "usr2"
  }
  description "rule1 and action1"
}
}

```

Modify existing profile by adding rule1 to it with command actions and user and group identity info.

list profile

Displays the current list of profile rules.

#### OPTIONS

description  
User defined profile description.

timeout  
User defined timeout value.

rules  
Adds, deletes, or replaces a profile rule.

description  
User defined rule description.

actions  
Specifies the rule actions that the system takes when a profile is applied.

shell-action  
Specifies the rule shell action info.

sub-system-action  
Specifies the rule sub system info.

sftp-up-action  
Specifies the rule sftp up action info.

sftp-down-action  
Specifies the rule sftp up action info.

scp-up-action  
Specifies the rule scp up action info.

scp-down-action  
Specifies the rule scp up action info.

rexec-action  
Specifies the rule rexec action info.

local-forward-action  
Specifies the rule local forward action info.

remote-forward-action  
Specifies the rule local forward action info.

x11-forward-action  
Specifies the rule x11 forward action info.

agent-action  
Specifies the rule agent action info.

other-action  
Specifies the rule other action info.

identity-users  
Specifies the rule users identity.

identity-groups  
Specifies the rule groups identity.

actions  
Specifies the profile default actions that the system takes when a profile is applied.

shell-action  
Specifies the rule shell action info.

sub-system-action  
Specifies the rule sub system info.

sftp-up-action  
Specifies the rule sftp up action info.

sftp-down-action  
Specifies the rule sftp up action info.

scp-up-action  
Specifies the rule scp up action info.

scp-down-action  
Specifies the rule scp up action info.

rexec-action  
Specifies the rule rexec action info.

local-forward-action  
Specifies the rule local forward action info.

remote-forward-action  
Specifies the rule local forward action info.

x11-forward-action  
Specifies the rule x11 forward action info.

agent-action  
Specifies the rule agent action info.

other-action  
Specifies the rule other action info.

auth-info  
Specifies the authentication info of public key and private key for this profile.

proxy-server-auth  
Specifies a set of private/public keys that can be used to authenticate proxy (BigIP) host server to the real clients during the initial key exchange of the SSH session between real clients and BigIP acting as a proxy server. A SSH Profile MUST have at least 1 set of private/public key configured for proxy server authentication.

private-key  
Specifies the private key of the authentication algorithm (RSA, DSS etc) used for the proxy server authentication.

public-key  
Specifies the public key of the authentication algorithm (RSA, DSS etc) used for the proxy server authentication.

proxy-client-auth  
Specifies a set of private/public keys that can be used to support 'publicKey' based client authentication as defined in RFC 4252 (The Secure Shell (SSH) Authentication Protocol). Note that this is optional in a SSH profile and is only required to support 'publicKey' based client authentication (as defined in section 7 of the above mentioned RFC).

private-key  
Specifies the private key of the authentication algorithm (RSA, DSS etc) used for the proxy client authentication.

public-key  
Specifies the public key of the authentication algorithm (RSA, DSS etc) used for the proxy client authentication.

real-server-auth  
Specifies public key that can be used to authenticate real host server to the proxy (BigIP) client during the initial key exchange of the SSH session between BigIP acting as a proxy client and a real ssh (backend) server. If user does not configure any public key for the real server authentication in a SSH profile, all (backend) real servers are always trusted.

public-key  
Specifies the public key of the authentication algorithm (RSA, DSS etc) used for the real server authentication.

## sys

### sys alert lcd

NAME        alert - Manages outstanding alerts.

MODULE     sys

SYNTAX     Manages the outstanding alerts on the system when used with the syntax below.

DISPLAY    show alert lcd

MODIFY     reset-stats alert lcd  
reset-stats alert lcd [ priority { alert | critical | emergency | error | info | warning } ]

DESCRIPTION  
You can use the lcd component to display or clear the lcd alerts for the system. The clear lcd alerts can be issued with the priority option followed by the priority value in which case only alerts with matching priority are cleared.

EXAMPLES  
show alert lcd  
  
Displays lcd alerts.  
  
reset-stats alert lcd  
  
Clears all lcd alerts.

SEE ALSO    reset-stats, show, sys alert lcd, tmsh

## sys aom

NAME        aom - Manages Always On Management subsystem

MODULE     sys

SYNTAX     Manages the Always On Management(AOM) subsystem when used with the syntax below.

DISPLAY

aom list

MODIFY  
aom [ readonly | webui | media-redirectation | vkvm | ipmi ] [ enabled | disabled ]

DESCRIPTION

You can use the aom component to manage the AOM access for the system. All AOM controls are disabled by default. These commands are not supported on all platforms.

readonly reduces the AOM menu to status only, the AOM cannot be used to change the system.

webui controls access to the AOM web services, when enabled this opens port 443 on the AOM for HTTPS. This option is not available on all platforms.

media-redirectation controls if the AOM can access a virtual media server to allow the user to mount a file or iso image from a remote system to the AOM. Only allowed when webui is enabled. Media-redirectation opens up ports 5120/5124(CDMEDIA) 5122/5126(FDMEDIA) and 5123/5127(HDMEDIA) on the AOM. This option is not available on all platforms.

vkvm controls AOM webui Virtual Keyboard, Video and Mouse redirection. Only allowed when webui is enabled. This opens up port 7578/7582. This option is not available on all platforms.

ipmi controls ipmi access over LAN. When enabled ipmi commands into the AOM over the network port 623(IPMI) and 52123(SSHSOL) are allowed.

EXAMPLES

list sys aom all-properties

Displays aom configuration.

modify sys aom ipmi enabled

Allows IPMI access into the Always On Management subsystem.

SEE ALSO

modify, list, tmsh

## sys appiq config

NAME

config - Configures this BIG-IP for AppIQ feature.

MODULE

sys appiq

SYNTAX

Automatically configures AppIQ feature on this box with given ECM host IP.

MODIFY

modify config

options:

host-ip [ip address]

DISPLAY

list config

options:

all-properties

DESCRIPTION

When run for the first time, this command automatically creates necessary configuration objects to establish communication between BIG-IP and ECM cluster. The command can be reused to change the configured host IP of the ECM cluster.

OPTIONS

host-ip

Specifies an IPv4/6 address for the ECM host. By default, this value is "any6" and AppIQ is disabled. Upon setting this value, the feature is enabled.

User can later delete automatically created and configured AppIQ logging profiles under System configuration to disable the feature. Please note that the command needs to be re-run to enable the feature if the configuration is manually removed/changed.

SEE ALSO

## sys application apl-script

**NAME**  
apl-script - Provides scripts that can be included by an application template.

**MODULE**  
sys application

**SYNTAX**  
Configure the apl-script component within the sys application module using the syntax in the following sections.

**EDIT**  
create apl-script [name]  
modify apl-script [name]  
options:  
apl-checksum [[string] | none]  
apl-signature [[string] | none]  
description [[string] | none]  
ignore-verification [true | false]  
edit apl-script [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties

**DISPLAY**  
list apl-script  
list apl-script [ [name] | [glob] | [regex] ] ... ]

**DELETE**  
delete apl-script [name]

**GENERATE**  
Note: generate cryptographic signature or checksum based on apl script text.  
generate sys application apl-script [name]  
options:  
checksum  
signature

**DESCRIPTION**  
An APL script contains APL that can be directly included into application templates. APL scripts provide a convenient way to build libraries of common presentation elements. For detailed description of application presentation language elements, See help page of sys application template

**EXAMPLES**  
The following is a fairly simple example of an APL script and a template that makes use of the APL script. The APL script defines a user type that can then be used multiple times in different templates.

```
sys application apl-script com.f5.apl.example {
    define string port validator "PortNumber"
}

sys application template example_template {
    actions {
    definition {
        presentation {
            include "com.f5.apl.example"
            section my_section {
                string address1
                port portnum1
                string address2
                port portnum2
            }
        }
    }
}
}
```

generate my\_script checksum

Generate a checksum for the script text and add the checksum as a

property.

generate my\_script signature signing-key my\_key

Generate a signature for the script text using the specified private key and add the signature as a property.

Note: For a script which includes a checksum or signature to successfully load, the script text contents must match the stored checksum or signature.

To temporarily stop the verification of signature or checksum and still retain the checksum or signature, the ignore-verification attribute must be set to true. This is done by editing the script and adding the ignore-verification attribute.

To completely clear the signature or checksum, simply set the attribute script-signature or script-checksum to empty string "". By doing so, the script will be processed as if it was never signed or checksummed.

```
modify apl-script my_script {
description none
script {
}
ignore-verification true
script-checksum 74778e7b13016e0b9329a17f8d2da601
total-signing-status checksum
verification-status checksum-verified }
```

#### OPTIONS

You can use these options with the apl-script command:

checksum

Generate a checksum for the script text and add the checksum to the script as a property. Only for use with the generate command.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create and modify.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

script

Contains the APL text that can be imported into application templates.

signature

Generate a signature for the script text using the specified private key and add the signature to the script as a property. Only for use with the generate command.

signing-key

The private key to use for signing the script. Only for use with the signature option.

#### SEE ALSO

## sys application custom-stat

#### NAME

custom-stat - Provides derived statistics for iStats.

#### MODULE

sys application

#### SYNTAX

Configure the custom-stat component within the sys application module using the syntax in the following sections.

```

EDIT
create custom-stat [key]
modify custom-stat [key]
options:
  app-service [[string] | none]
  keyspace [string]
  formula [string]
  measure [string]
edit custom-stat [ [key] | [glob] | [regex] ] ... ]
options:
  all-properties

DISPLAY
list custom-stat
list custom-stat [ [key] | [glob] | [regex] ] ... ]

DELETE
delete custom-stat [key]

DESCRIPTION
  Statistics are derived for objects in the given keyspace based on the
  given formula, producing the given measure.

EXAMPLES
  create sys application custom-stat myKey
  keyspace sys.application.service
  measure conns_per_min
  formula "rate counter conns 60"

  Creates a derived iStat.

OPTIONS
  You can use these options with the custom-stat component:

  app-service
  Specifies the name of the application service to which the object
  belongs. The default value is none. Note: If the strict-updates
  option is enabled on the application service that owns the object,
  you cannot modify or delete the object. Only the application
  service can modify or delete the object.

  formula
  Specifies the first token in the formula indicates the computation
  to be made. Currently only rates are supported.

  rate

  rate computes the rate of change of the source measure over the
  last seconds. This is applicable only to
  numeric measures. The derived measure is of type gauge.

  keyspace
  Specifies that a derived iStat will be computed for all objects in
  the given keyspace for which the formula is computable (the source
  measure of the correct type exists).

  measure
  Specifies the name of the derived measure to be created. The type
  of the derived measure is dependent on the formula.

SEE ALSO
  create, modify, sys application service

## sys application service

```

NAME
  service - Configures traffic management application services.

MODULE
  sys application

SYNTAX
  Modify the service component within the sys application module using
  the syntax shown in the following sections.

CREATE/MODIFY
  create service [name]
  modify service [name]

```

```

options:
  description [string]
  device-group [[string] | default | non-default | none]
  execute-action [name]
  lists [add | delete | modify | replace-all-with] {
    [name] {
      options:
    }
  }
  value { [string]... }
  value none
  encrypted [yes | no]
}
}
lists none
strict-updates [disabled | enabled]
tables [add | delete | modify | replace-all-with] {
  [name] {
    options:
  }
  column-names { [name] ... }
  encrypted-columns { [name] ... }
  rows { { row { [value] ... } row { [value] ... } ... } }
  rows none
}
}
tables none
template [name]
traffic-group [[string] | default | non-default | none]
variables [add | delete | modify | replace-all-with] {
  [name] {
    options:
  }
  value [string]
  encrypted [yes | no]
}
}
variables none

metadata
  [add | delete | modify] {
    [metadata_name ... ] {
  }
  value [ "value content" ]
  persist [ true | false ]
}
}

edit service [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties

DISPLAY
list service
list service [ [ [name] | [glob] | [regex] ] ... ]
show running-config service
show running-config service [ [ [name] | [glob] | [regex] ] ... ]
  options:
    all-properties
    non-default-properties
    one-line
    partition

```

Note: Application Service objects are always created in a subfolder of the current folder. Make sure the correct path is used to display the service. E.G list myapplication.app/myapplication

```

DELETE
delete service [name]

```

#### OPTIONS

You can use these options with the service component:

**description**  
User defined description.

**device-group**  
Specifies the name of the device group to which the application service is assigned. If this property is modified with the default keyword, the value of the parent folder or partition will be used and the inherited-devicegroup property will be set to true.

**execute-action**  
Runs the specified template action associated with the service.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**lists**  
Provides the set of list variables and values that are passed to template scripts.

**metadata**  
Associates user defined data, each of which has name and value pair and persistence. The default value is persistent, which means the data will be saved into the config file.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**strict-updates**  
Specifies whether configuration objects contained in the application service can be directly modified outside the context of the system's application service management interfaces.

**tables**  
Provides the set of table variables and values that are passed to template scripts.

**template**  
The template defines the configuration for the application service. Generic application service has no template associated with it. This can be changed after the service has been created to move the service to a new template. A templated application service can be converted to a generic application service by setting new template to none or empty string. Similarly a generic application service can be made templated by associating it with the existing template.

**template-modified**  
Indicates that the application template used to deploy the service has been modified. The application service should be updated to make use of the latest changes.

**template-prerequisite-errors**  
Indicates any missing prerequisites associated with the template that defines this application.

**traffic-group**  
The name of the traffic group that the application service is assigned to. If this property is modified with the "default" keyword, the value of the parent folder or partition will be used and the inherited-trafficgroup property will be set to true.

**variables**  
The set of atomic variables and values that are passed to template scripts.

list template [name]

DELETE  
delete template [name]

#### GENERATE

Note: generate cryptographic signature or checksum based on template fields - html-help, implemenation, macro and presentation in definition section.

generate template [name]  
options:  
checksum  
signature

#### SAVE/LOAD

save template [name] file [filename]  
load template [filename]

#### DESCRIPTION

Application templates allow a user to define a custom interface for easily creating complex configurations. The user can create multiple templates for various types of configurations. Once built, the user can use a template to create an application, which is a specific set of configuration objects (such as Virtual IP addresses, pools, and so forth), that work together to perform some task.

The template is composed of two primary parts, the presentation and the implementation.

The presentation section describes a form (a set of questions and user interface elements) that the user must fill out in order to create an application.

The implementation section describes how the values collected from the user (the form variables) are used to generate the actual configuration objects which are part of the application.

The presentation section of the template is written in a simple language called Application Presentation Language or APL. The implementation section of the template is written in TCL and provides access to tmsh scripting commands.

#### APPLICATION LIFECYCLE

Before describing in detail how a template is written, it is important to explain how the resulting template will be used. Since templates are used to create and edit applications, it makes sense to review the application lifecycle.

##### Application Creation

The user selects which template to use for his application. The system presents an empty form, based on the template's presentation script that the user fills out and submits. The system collects and stores the form variables in a newly created application object. Configuration objects are generated based on the form variables by the template's implementation script.

##### Application Editing

The user selects an existing application that he would like to change. The system reloads the form associated with the template that was used to create the application and refills all form variables using the previous user input, which is gathered from the application object. The user edits the form and submits it. The template's implementation script is run again to compute a new set of configuration objects for the application. The system alters the current configuration objects associated with the application to match the newly computed set of configuration objects, including creating, modifying, and deleting objects as needed.

##### Application Deletion

The user selects an application to delete. All configuration objects associated with the application are removed.

#### APPLICATION TEMPLATE LANGUAGE

The application template language describes the user interface presented to a user making a new application, or editing an existing application. It describes what questions to ask, how the questions are presented (for example, a free form field or a list of options), and the names of the variables used to store the values the user inputs.

It consists of a set of primitive form elements (string, choice, etc), a set of grouping and organization constructs (section, table, etc), methods for hiding or displaying portions of the form based on the values of other portions (optional), a method to associate human-readable text with various form elements (text) and methods for creating user defined types(define group, define section, etc) for reuse of application presentation language elements.

##### Primitive Elements

Primitive elements represent the actual user interface components. The system displays each primitive element as part of the form, and associates it with a form variable. The following lists the basic primitive types:

###### choice

A list of options from which the user can select (a drop-down menu).

```
choice [default ""] [display ""] {"", "", ...}
```

###### editchoice

Multiple choices are available that the user can select, or a new value can be entered if the choices are not acceptable.

```
choice [default ""] [display ""] {"", "", ...}
```

#### multichoice

Similar to a basic choice element except that multiple items may be selected from the available choices.

```
choice [default ""] [display ""] {"", "", ...}
```

#### password

Similar to a string element except the contents may be obscured to prevent others from seeing the value.

```
password [default ""] [display ""] [required]
```

#### string

A basic text box into which the user can enter an arbitrary string.

```
string [default ""] [display ""] [required] [validator ""]
```

Each primitive element is associated with a variable name, which defines where the value collected by the form is stored. In addition, primitive elements can have additional parameters such as a default value, a validation method that provides for additional requirements (for example, the string must be an IP address).

The following defines the format for the string primitive values, using normal BNF syntax:

- o default - A sensible default value to which the string is initialized when a new application is created.
- o display - Directs the renderer how to display the element. This can be small, medium, large, xlarge, or xxlarge.
- o required - If present, a valid value must be entered before the application can be created.
- o validator - The name of a well known validation method.

#### Section

The section construct is used to group form variables (primitives) into logical sections for display.

Each section is named, and header text can be defined for a section using the text construct.

Every variable must be inside a section. The format for a section is:

```
section { }
```

For example, to represent the data associated with a virtual IP:

```
section vip
{
  string address
  string port default "80" display "small"
}
```

#### Table

The table construct is similar to section, except that it represents a grouping of elements that can be repeated zero or more times. The syntax for table and section are identical.

```
table { }
```

For example, to collect a list of nodes from a user to populate a pool, you can add any number of nodes, each of which has an address and port:

```
section pool
{
  table members
  {
    string address
    string port default "80" display "small"
  }
}
```

The table above is displayed using a JavaScript-editing widget that enables you to add and remove pool members. Each member contains two form variables: address and port.

#### Optional

The optional construct allows the form elements to be hidden or shown based on the state of other form elements. The syntax of the optional construct is:

```
optional ( ) { }
```

The expression in the optional construct is evaluated during the display of the form. The content section is displayed or hidden, based on its value.

To dynamically hide parts of the presentation based on the answer to a earlier question, use the variable name in the expression:

```
section chooseopts {
  choice show_section_1 {"yes", "no"}
}
section section1
{
  optional (chooseopts.show_section_1 == "yes")
}
```

```
{
  string str
}
```

#### User defined types

The define construct allows the creation of user-defined types out of primitive types. The defined type can then be used multiple times independently at different places. This is especially useful in conjunction with the include element because types can be defined in the included application presentation language script and then used where necessary in the template. For more details on application presentation language script, See help sys application apl-script.

For example, user defined choice type can be defined as below and can be reused at multiple sections:

```
define choice yesno {
  "Yes", "No"
}
section ssl_section {
  yesno use_ssl
}
section optimizations {
  yesno use_wa
  yesno offload_ssl
}
```

The define group construct allows the creation of user-defined type to allow the user to group multiple elements of existing types together. The defined type can be reused multiple times independently similar to the above.

For example IPAddress and port can be grouped into a user-defined type and reused in multiple sections:

```
define group addrport {
  string addr required validator "IPAddress"
  string port
}
section http_section {
  addrport server
}
section sip_section {
  addrport client
  addrport server
}
```

#### Localization

The text element lets you define the localized text labels for sections, table, row and other sub-elements. For message element, body text can be localized in addition to the label. Similarly for the choice, editchoice and multichoice element, display text associated with each choice value can be localized. The syntax for the text element is:

```
text [""] {
""
. ""
. "" ""
. "" { "" => "", "" => "", ... }
}
```

Depending on the locale used (setting in the browser), particular text label, body text or choice display text will be shown to the user.

For example, string, message and choice display texts can be localized as below.

```
section http
{
  message intro
  string address
  string port default "80" display "small"
  choice pools default "pool1" { "pool1", "pool2", "pool3" }
  choice profile default "http" tcl {
    set choices "no\n"
    append choices "http\n"
    append choices [tmsh::run_proc f5.app_utils:get_items ltm profile http]
    return $choices
  }
}
```

```
text {
vs "HTTP Application"
vs.intro "Introduction" "This template supports simple web server implementations"
vs.address "What IP address do you want to use for this virtual server?"
vs.port "What port do you want to use for this virtual server?"
vs.pools "Use pool.." {"Internal" => "pool1", "Public cloud" => "pool2", "Private data center" => "pool3" }
vs.profile "Use profile.." { "Do not use profile" => "no", "Use F5's recommended profile" => "http" }
}
```

```
text "de_AU" {
vs "HTTP-Anwendung"
vs.intro "Einführung" "Diese vorlage unterstützt einfache web-server-implementierungen"
vs.address "Welche ip-adresse mochten Sie für diesen virtuellen Server zu verwenden?"
vs.port "Welchen port willst du für diesen virtuellen Server zu verwenden?"
vs.pools "Verwenden pool.." {"intern" => "pool1", "Privat Rechenzentrum" => "pool3", "Öffentliche Cloud" => "pool2" }
vs.profile "Mit profil.." { "Verwenden sie kein profil" => "no", "Verwenden von F5 empfohlen profil" => "http" }
}
```

A user from Austria will see the german text, all other locales will see the default (locale-less) text.

While localizing choice value display text, users are allowed to use different ordering of choice values in each locale. If TCL is used to populate the choices, then best effort is made to match what is returned in the TCL to the given localized choice value. In the above example, the embedded TCL script for profile will return two static choices (no and http) followed by the list of all http profiles. These static choices are localized, but not the other results. When the TCL results contain a mix of localized and non-localized choices, the localized choices will always be listed first in the order specified in the text element.

With the localization, message body and static choices will become optional in the declaration. If the message body is provided in both the declaration and in text element, the body in the text element will override the body in the variable declaration. Same applicable for the display text of choice value provided in declaration. The recommended syntax for choice, editchoice and multichoice element is to give just the choice values in the variable declaration, and give the display text of the choices in the text element.

#### TMSH SCRIPTING SUPPORT

Once the user finishes editing an application, the form variables are saved, and the implementation section of the associated template is run. The implementation section is an ordinary TCL script and can use the standard set of tmsh scripting extensions. In addition, there are a few template-specific additions.

First, access to the form variable is done using the syntax, where

is the name of the section to which the variable belongs, and  
is the name of the form variable:

```
$::
```

Next, a table can be iterated over, and for each list element, the components of the list can be gathered using the tmsh::get\_field\_value command. For example, for the pool member example described in the section regarding the list, you can use the following syntax:

```
foreach member $::pool_members {  
  set the_addr [tmsh::get_field_value $member address]  
  set the_port [tmsh::get_field_value $member port]  
  # Do something with the_addr and the_port  
}
```

This means for variable access can also be used within a script macro. Expansion of a macro is done using the tmsh::expand\_macro command. Usage:

```
tmsh::expand_macro [macro] [name_value_pair_list]
```

The variables defined in the presentation are automatically available from within the macro. If additional variables are needed from within the macro, they can be specified via name\_value\_pair\_list. Variables defined this way will take precedence over duplicate variables defined in the presentation.

#### TMSH BUILT-IN VARIABLES

Specific details on application and application template is provided to implementation section using built-in variables. Following are the variables available for use.

tmsh::app\_name

Stores the user-provided application name string.

tmsh::app\_name\_path

Stores the path name of application in configuration database.

tmsh::app\_template\_name

Stores the user-provided application template name including the path in configuration database.

tmsh::app\_template\_action

Stores the application template action name.

#### EXAMPLES

The following template example shows both the presentation and implementation sections. (It lacks some features, such as use of optional, defaults, validators, etc.)

```
presentation {  
  section basic  
  {  
    choice ssl_enabled { "true", "false" }  
    string addr  
    string more_stuff  
    table servers  
    {  
      string addr  
      string port  
      string ratio  
    }  
  }  
} text  
{  
  basic "Some example questions"  
  basic.ssl_enabled "Should SSL be enabled?"  
  basic.addr "What address should we use for the VIP?"  
  basic.servers.addr "Address"
```

```

    basic.servers.port "Port"
  }
}

implementation {
  if { $::basic_ssl_enabled }
  {
    set profile_name [format "%s_%s" $tmsh::app_name clientssl]
    tmsh::create ltm profile client-ssl $profile_name
    append profile_name " http"

    set destination "$::basic_addr:https"
    set monitor https
  }
  else
  {
    set profile_name http
    set destination "$::basic_addr:http"
    set monitor http
  }
}

set pool_name [format "%s_%s" $tmsh::app_name pool]

set members \{
  foreach server $::basic_servers {
    append members [tmsh::get_field_value $server addr]
    append members ":"
    append members [tmsh::get_field_value $server port]
    append members " { ratio "
    append members [tmsh::get_field_value $server ratio]
    append members "}"
    append members " "
  }
}
append members \}

tmsh::create ltm pool $pool_name \
  members replace-all-with $members \
  monitor $monitor

set vs_name [format "%s_%s" $tmsh::app_name virtual]
tmsh::create ltm virtual $vs_name \
  destination $destination \
  profiles replace-all-with "{ $profile_name }" \
  snat automap \
  pool $pool_name \
  http-class none
}

```

generate my\_app checksum

Generate a checksum for the template definition and add the checksum as a property.

generate my\_app signature signing-key my\_key

Generate a signature for the template definition using the specified private key and add the signature as a property.

Note: For a template which includes a checksum or signature to successfully load, the definition contents must match the stored checksum or signature.

To temporarily stop the verification of signature or checksum and still retain the checksum or signature, the ignore-verification attribute must be set to true. This is done by editing the script and adding the ignore-verification attribute.

To completely clear the signature or checksum, simply set the attribute script-signature or script-checksum to empty string "". By doing so, the script will be processed as if it was never signed or checksummed.

```

sys application template my_tmpl {
actions {
  definition {
    html-help {

    }
  }
  implementation {
    # insert tmsh script
  }
  presentation {
    # insert apl script
  }
  role-acl none
  run-as none
}
description "This is my template"
ignore-verification true
script-checksum 74778e7b13016e0b9329a17f8d2da601
total-signing-status checksum
verification-status checksum-verified }

```

#### OPTIONS

actions

Adds, deletes, or replaces a set of template actions. You can configure the following options for an action:

html-help

The help for the application template action formatted as HTML.

implementation

The script that is run to create the configuration objects

associated with the application.

name The name of the application template action.

presentation

The questions that must be answered to create an application from the template.

role-acl

The list of roles that are allowed to run the action.

run-as

The user account that will be used to run the implementation script. If no account is specified, the script is run as the calling user.

checksum

Generate a checksum for the template definition and add the checksum to the template as a property. Only for use with the generate command.

signature

Generate a signature for the template definition using the specified private key and add the signature to the template as a property. Only for use with the generate command.

signing-key

The private key to use for signing the template. Only for use with the signature option.

description

User defined description.

metadata

Associates user defined data, each of which has name and value pair and persistence. The default value is persistent, which saves the data into the config file.

partition

Displays the administrative partition within which the application template resides.

prerequisite-errors

A message indicating if there are any errors with the prerequisites for the template on the current BIG-IP system. If there are errors no applications can be created from this template. If there are no errors then the template is valid.

requires-modules

Adds, deletes, or replaces the list of modules that are required to be provisioned for this template to work.

requires-bigip-version-max

Specifies the maximum version of BIG-IP software required by this template.

requires-bigip-version-min

Specifies the minimum version of BIG-IP software required by this template.

#### THIRD PARTY TCL LIBRARY USAGE

A selection of third party libraries have been tested to work within the CLI script environment. These include MD5, BASE64, SHA1/SHA256, HTTP, TLS, TCL Perl, LDAP client, and XML parser. The TCL packages can only reside in the /use/share/compat-tcl8.4 directory.

Important: Only these tested packages are supported currently.

The following example shows how the Tcl package command can make use of the XML parser:

```
cli script /Common/use_xml {
proc script::EStart {tag attlist args} {
  array set attr $attlist
  puts "Element \"$tag\" started with [array size attr] attributes"
}

proc script::PCData text {
  incr ::count [string length $text]
}

proc script::run {} {
  namespace eval :: {
    set count 0
  }
  puts "running use_xml...\n"
  set pkg_name xml
  if {[catch {package require $pkg_name 3.2}]} {
    puts "No package found: $pkg_name!\n"
  }
  else {
    puts "Found package: $pkg_name!\n"
    set parser [xml::parser]
    $parser configure -elementstartcommand script::EStart -characterdatacommand script::PCData
    set fp [open "/shared/test.xml" r]
    set text [read $fp]
    $parser parse $text
    puts "The document contains $::count characters"
    close $fp
  }
}
}
```

Here are some additional examples:

```

cli script /Common/use_shal {
proc script::run {} {
  set pkg_name shal
  if {[catch {package require $pkg_name}]} {
    puts "No package found: $pkg_name!\n"
  }
  else {
    puts "Found package: $pkg_name!\n"
    puts "TCL does SHA1 now:"
    puts [shal::shal -hex "TCL does SHA1"]
  }
}

cli script /Common/use_base64 {
proc script::run {} {
  set pkg_name base64
  if {[catch {package require $pkg_name}]} {
    puts "No package found: $pkg_name!\n"
  }
  else {
    puts "Found package: $pkg_name!\n"
    set chemical [encoding convertto utf-8 "C\u2088H\u2081\u2080N\u2084\u2082"]
    set encoded [base64::encode $chemical]
    set caffeine [encoding convertfrom utf-8 [base64::decode $encoded]]
    puts "Caffeine: $caffeine"
  }
}
}

```

## sys autoscale-group

**NAME**  
 autoscale-group - Configure autoscale group ID for BIG-IP VE Autoscale Service on Amazon Web Services(AWS).

**MODULE**  
 sys

**SYNTAX**  
 Configure the autoscale-group component within the sys module using the syntax in the following sections.

**CREATE/MODIFY**  
 modify autoscale-group [name]  
 options:  
 autoscale-group-id [[string] | none]  
 description [string]

edit autoscale-group [name]  
 options:  
 all-properties

**DISPLAY**  
 list autoscale-group  
 list autoscale-group [name]  
 options:  
 all-properties  
 one-line

**DESCRIPTION**  
 Specifies Amazon Web Services (AWS) Auto-Scaling Group ID to which given BIGIP-VE belongs to. These settings will be used for Auto Scaling BIG-IP instances based on user specified policy by Amazon Web Services(AWS).

**OPTIONS**  
 autoscale-group-id  
 Specifies autoscale-group id as reported by Amazon Web Services(AWS).  
 description  
 User defined description.

## sys clock

#### NAME

clock - Displays the current date and time.

#### MODULE

sys

#### SYNTAX

```
DISPLAY
show clock
options:
  field-fmt
modify clock
options:
  time [time]
```

#### DESCRIPTION

You can use the clock component to display the system date and time.

#### EXAMPLES

```
show clock
```

Display the current date and time.

```
modify clock time 2012-12-11:12:30:45
```

Set the system clock to the specified time.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2013-03-22 sys clock(1)

---

## sys cluster

#### NAME

cluster - Configures a cluster in a VIPRION(r) system.

#### MODULE

sys

#### SYNTAX

Configure the cluster component within the sys module using the syntax in the following sections.

```
MODIFY
modify cluster [name]
options:
  address [IP address | none]
  members {
    [1 | 2 | 3 | 4] {
```

```
options:
  address [IP address | none]
  [disabled | enabled]
  priming [disabled | enabled]
}
min-up-members [integer]
min-up-members-enabled [no | yes]
```

edit cluster default

```
options:
  all-properties
  non-default-properties
```

DISPLAY

list cluster

```
options:
  all-properties
  non-default-properties
  one-line
```

show running-config cluster

show running-config cluster [option name]

```
options:
  one-line
```

show cluster

show cluster [option name]

```
options:
  all-properties
  field-fmt
```

#### DESCRIPTION

You can use the cluster component to modify the configuration of the primary blade in a cluster. When you do this, the system automatically propagates the changes to the other blades in the cluster. This is known as cluster synchronization.

#### EXAMPLES

```
modify cluster default address 192.168.217.44/24
```

Sets the floating management IP address for the cluster default to an IP address of 192.168.217.44.

```
list cluster my_cluster
```

Displays the properties of the cluster named my\_cluster.

#### OPTIONS

address

Specifies an IP address for the cluster or cluster member. The default value is none.

disabled

Disables the specified cluster member. The default value is enabled.

enabled

Enables the specified cluster member. This is the default value.

members

Specifies the cluster members to be acted on by the command. A cluster member is a slot into which you insert a blade. The cluster member is identified by the number assigned to the slot.

min-up-members

Specifies the minimum number of cluster members that must be up for the cluster to remain Active. The default value is 0.

min-up-members-enabled

When set to yes, specifies that when the number of cluster members that are active is below the value of the option min-upmembers, the cluster fails over to its peer. The default value is no.

Enable this parameter when you configure a redundant pair.

Important: Make sure that you modify the value of the min-up-members option appropriately when you take blades down in a cluster. Otherwise, you can get into the condition where disabling a cluster member brings the cluster below the value of the option min-up-members, which can cause the cluster to fail over to its peer.

name

Specifies a name for the cluster. This option is required.

priming

Prevents a cluster member from proceeding to the RUNNING cluster quorum state, which is useful when a blade is in a reboot loop. The default value is disabled.

#### SEE ALSO

edit, list, modify, show, tmsh

## sys config-diff

**NAME**  
config-diff - Displays the differences between two specified single configuration files (SCFs).

**MODULE**  
sys

**SYNTAX**  
Display information using the config-diff component within the sys module with the syntax in the following section.

**DISPLAY**  
show config-diff [file name] [file name]

**DESCRIPTION**  
You can use the config-diff component to display the differences between two previously created SCF files.

**EXAMPLES**  
show config-diff my.scf your.scf  
  
Displays information about the differences between two specified files.

**OPTIONS**  
file name  
Specifies the name of an SCF file that you want to compare to another SCF file.

**SEE ALSO**  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys config

**NAME**  
config - Manages the BIG-IP(r) system configuration.

**MODULE**  
sys

**SYNTAX**  
Save the running configuration or load the system configuration files within the sys module using the following syntax.

**MODIFY**  
save config  
options:  
base  
binary  
current-partition  
exclude-gtm  
file  
gtm-only  
no-passphrase  
one-line  
passphrase

partitions  
tar-file  
time-stamp  
user-only  
wait

load config  
options:  
base  
current-partition  
default  
exclude-gtm  
file  
files-folder  
from-terminal  
gtm-only  
merge  
passphrase  
partitions  
tar-file  
user-only  
verify

delete config file [file name]

DISPLAY  
list config file

#### DESCRIPTION

The system applies all configuration changes that you make from within tmsb to the running configuration. To save the running configuration to the system configuration files, use the command sequence save config. Additionally, you can replace the running configuration with the configuration in the system configuration files using the command sequence load config.

If any of these options are not specified, save/load config will save or load the configuration in all partitions on this system:

- o binary
- o default
- o file
- o from-terminal
- o partitions

#### EXAMPLES

save config

Saves the running configuration in all partitions by overwriting the system configuration files.

In Virtual Editions with f5-swap-eth installed, saves the mapping of Ethernet device names and MAC addresses to /etc/ethmap to make the working BIG-IP still work after adding/deleting virtual NIC(s). It also works for save config partitions all.

save config base

Saves the running base configuration in all partitions by overwriting the system base configuration files.

save config binary

Saves all running configuration by overwriting the system binary configuration database file.

save config current-partition

Saves the running configuration in current update partition by overwriting the system configuration files.

save config wait

Save request waits if another save operation is in progress.

save config file my\_file tar-file my\_tar\_file no-passphrase

Saves all running configuration to the specified file, my\_file, and all the user provided disk files referred to by the configuration into my\_tar\_file. From v12.1.0 onwards the no-passphrase option should be explicitly specified for saving the unencrypted SCF and SCF.tar.

save config file my\_file passphrase my\_password

Saves all running configuration to the specified file, my\_file and encrypt it with my\_password.

save config partitions { my\_partition }

Saves the running configuration in my\_partition by overwriting the system configuration files.

save config partitions all

Saves the running configuration in all partitions by overwriting the system configuration files.

save config user-only

Saves only user account configuration by overwriting the system

configuration files.

load config

Replaces the running configuration in all partitions with the configuration in the system configuration files.

load config base

Replaces the running base configuration in all partitions with the configuration in the system base configuration files.

load config current-partition

Replaces the running configuration in current update partition with the configuration in the system configuration files.

load config merge file my\_file

Loads the specified configuration from my\_file, which modifies the running configuration.

load config verify file my\_file

Validates the specified configuration in my\_file to see whether they are valid to replace the running configuration. The running configuration will not be changed.

load config verify merge file my\_file

Validates the specified configuration in my\_file to see whether they are valid to be merged into the running configuration. The running configuration will not be changed.

load config default

Sets system configuration back to factory default settings.

load config file my\_file tar-file my\_tar\_file

Replaces all running configurations with the configuration in the specified file, my\_file and the disk files referred to by the configuration are retrieved from my\_tar\_file.

load config file my\_file files-folder my\_files\_folder

Replace all running configuration with the configuration in the specified file, my\_file and the disk files referred to by the configuration is taken from the directory tree under my\_files\_folder.

load config file my\_file passphrase my\_password

Replaces all running configuration with the configuration in the specified encrypted file, my\_file and decrypt it with my\_password.

While searching for disk files under the specified folder, the order of search is first by file name as in cache-path, and then by object-name. If more than one file is found for a name, then the relative path in the cache-path is used to make the selection.

That is, while looking for

Looks for file(s) named B.  
If none are found, looks for file(s) named "xxx"

When more than one file is found, looks for a copy that matches paths in the order:

B>  
B>

load config partitions { x }

Replace the running configuration in partition x with the configuration in the system configuration files.

load config partitions all

Replace the running configuration in all partitions with the configuration in the system configuration files.

load config from-terminal

Replace the running configuration with what is entered from the terminal.

1. Type the initial command. 2. The system responds with a confirmation prompt, type Y to confirm.

Replace the running configuration? (y/n) y

3. Type in the replacement configuration entries.

```
net self-allow {
  defaults {
    igmp:any
    ospf:any
    pim:any
    tcp:161
    tcp:22
    tcp:4353
    tcp:443
    tcp:53
    udp:1026
    udp:161
  }
}
```

```

    udp:4353
    udp:520
    udp:53
}
net stp-globals {
  config-name 00-01-D7-B5-67-00
}
sys management-ip 172.27.41.70/24 { }
sys management-route default {
  gateway 172.27.41.254
}
sys provision ltm {
  level nominal
}
....
ltm pool pool1 {
  slow-ramp-time 200
}
.....
^D

```

4. Use Ctrl+D to submit the changes or Ctrl+C to cancel the changes.

delete config file myfile

Delete myfile in default directory, /var/local/scf/.

list config file

Display files in default directory, /var/local/scf/.

#### OPTIONS

**base** Indicates the base configuration. This option cannot be specified with the binary, default, gtm-only, and user-only options.

**binary**  
Indicates binary configuration. This option may not be specified with any other options.

**default**  
Indicates factory default configuration. This option cannot be specified with any other options.

**file** Loads or saves a configuration from the specified file. For save, a file with a relative path is saved in the default directory, /var/local/scf. For load, in shell mode, the default directory, /var/local/scf, is used for a file with a relative path. In bash mode, for a file with a relative path, the current directory is searched first. If the file can't be found in the current directory, /var/local/scf is searched.

This option can be used with binary, default, from-terminal and partitions options.

**passphrase**  
Specifies a password to save or load an encrypted configuration file. This option can only be used with option file.

**tar-file**  
Loads or saves disk files referred to by the configuration from the specified tar file. A file with a relative path is looked up, relative to the current directory.

**files-folder**  
Loads disk files referred to by the configuration from the folder tree under the specified folder. Disk files by name are searched for recursively. When there is more than one file with the same name, the relative path of the file from the cache-path is used for selection.

**from-terminal**  
Specifies that the configuration will be input from the terminal in the same format as the system configuration files in . Use Ctrl+D to submit the changes and Ctrl+C to cancel the changes.

This option cannot be specified with default, file and partitions.

**gtm-only**  
Indicates the Global Traffic Manage (GTM) configuration. This option cannot be specified with the base, exclude-gtm, and user-only options.

**exclude-gtm**  
Indicates the BIG-IP configuration, excluding GTMs. This is only valid with the file option. This option cannot be specified with the base, gtm-only, and user-only options.

**merge**  
Loads the configuration from the specified file or from the terminal, which modifies the running configuration. If merging from the terminal, it requires Ctrl+D to complete the operation. This option is only valid with the file or from-terminal options.

**partitions**  
Indicates the partitions in which configuration components reside. This option cannot be specified with the default, file, from-terminal, or merge options.

**user-only**  
Indicates the configuration including user account information only. This option cannot be specified with the base, default, exclude-gtm, or gtm-only options.

**time-stamp**  
Inserts a time-stamp in a file name. This is only valid with the file option.

**verify**  
Validates the specified configuration from file(s) or from the terminal without changing the running configuration.

**wait** Specifies that tmsh should wait for another instance of tmsh to finish saving the configuration before proceeding. If wait is not specified and another instance of tmsh is in the process of saving the configuration, the command exits tmsh immediately (because the other instance of tmsh is already saving the configuration).

**SEE ALSO**

## sys connection

**NAME**  
connection - Sets idle timeout for, displays, and deletes active connections on the BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Use the connection component within the sys module to manage connections using the following syntax.

**MODIFY**  
modify connection  
options:  
idle-timeout [integer]

**DISPLAY**  
show connection  
option:  
all-properties  
age [integer]  
cs-client-addr [IP address]  
cs-client-port [ [integer] | [service] ]  
cs-server-addr [IP address]  
cs-server-port [ [integer] | [service] ]  
connection-id [ integer ]  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
protocol [name]  
save-to-file [ filename ]  
ss-client-addr [IP address]  
ss-client-port [ [integer] | [service] ]  
ss-server-addr [IP address]  
ss-server-port [ [integer] | [service] ]  
type [any | mirror | self | mptcp]

**DELETE**  
delete connection  
option:  
age [integer]  
cs-client-addr [IP address]  
cs-client-port [ [integer] | [service] ]  
cs-server-addr [IP address]  
cs-server-port [ [integer] | [service] ]  
connection-id [ integer ]  
protocol [name]  
ss-client-addr [IP address]  
ss-client-port [ [integer] | [service] ]  
ss-server-addr [IP address]  
ss-server-port [ [integer] | [service] ]  
type [any | mirror | self | mptcp]

**DESCRIPTION**  
You can use the connection component to set the idle timeout for or delete active connections to the BIG-IP system based on a specified filter. Additionally, you can display information about the active connections to the system.

You can specify the option using either a number or a service (80 or http).

Important: If you do not specify a port or service, the system deletes all connections that match just the IP address. If you do not specify an IP address, the system deletes all connections including mirrored connections.

#### EXAMPLES

`show connection all-properties`

Displays information about all active connections to the system.

`modify connection idle-timeout 300`

Changes the amount of idle time before a connection is disconnected to five minutes (300 seconds).

#### OPTIONS

`age` Specifies, in seconds, the age of the active connections that you want to display or delete.

`cs-client-addr`

Specifies the client-side remote IP address of the active connections that you want to display or delete.

`cs-client-port`

Specifies the clientside remote port of the active connections that you want to display or delete.

`cs-server-addr`

Specifies the clientside local IP address of the active connections that you want to display or delete.

`cs-server-port`

Specifies the clientside local port of the active connections that you want to display or delete.

`connection-id`

Specifies the MPTCP connection ID of the active connections that you want to display or delete.

`idle-timeout`

Specifies the interval, in seconds, that a connection can remain idle before the system closes the connection.

`protocol`

Specifies the protocol of the active connections that you want to display or delete.

`save-to-file`

Specifies the file which connection information can be save to. With this option, it can write a file larger than 2GB.

`ss-client-addr`

Specifies the serverside local IP address of the active connections that you want to display or delete.

`ss-client-port`

Specifies the serverside local port of the active connections that you want to display or delete.

`ss-server-addr`

Specifies the serverside remote IP address of the active connections that you want to display or delete.

`ss-server-port`

Specifies the serverside remote port of the active connections that you want to display or delete.

`type` Specifies the type of active connections that you want to display or delete. The possible values are:

`any` Specifies all active connections.

`mirror`

Specifies only mirrored connections.

`self` Specifies the connection with which you are accessing the system.

`mptcp`

Specifies the MPTCP type of connections.

#### SEE ALSO

## sys console

**NAME**  
console - Configures the serial console for the BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Configure the console component within the sys module using the syntax in the following section.

**MODIFY**  
modify console  
options:  
    baud-rate [integer]

**DISPLAY**  
show console

**DESCRIPTION**  
You can use the console component to configure the serial console on the BIG-IP system.

**OPTIONS**  
    baud-rate  
Specifies the baud rate for the serial console. Select from the following options:

- o 9600
- o 19200 (default)
- o 57600
- o 115200

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

## sys cpu

**NAME**  
cpu - Displays statistics about the Traffic Management Microkernel (TMM) service, specifically, CPU cycles.

**MODULE**  
sys

**SYNTAX**  
Display statistics for the cpu component within the sys module using the syntax in the following section.

**DISPLAY**  
show cpu  
options:  
    (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
global

**DESCRIPTION**  
You can use the cpu component to display the CPU cycles for the system. You can also specify the unit value in which the system displays statistics.

**EXAMPLES**  
show cpu  
  
Displays TMM processor statistics in the system default units.  
  
show cpu raw

Displays raw TMM processor statistics.

**SEE ALSO**

show, tmsh

**COPYRIGHT**

## sys crypto cert-validation-response ocspp

**NAME**

ocsp - Manages the OCSPP response of a certificate when it has OCSPP validation enabled.

**MODULE**

sys crypto cert-validation-response

**SYNTAX**

Use the ocspp component within the sys.crypto.cert-validation-response module to manage the cached OCSPP response of a given certificate.

**DELETE**

```
delete ocspp
options:
certificate [name]
```

**DESCRIPTION**

You can use the ocspp component to delete the cached OCSPP response of a given certificate. The response is automatically re-fetched, and the certificate status is updated subsequently.

**OPTIONS**

certificate  
Specifies the name of the certificate whose OCSPP response you want to delete.

**SEE ALSO**

delete, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys crypto cert-validator ocspp

**NAME**

ocsp - Configuration of the OCSPP cert-validator.

**MODULE**

sys crypto

**SYNTAX**

Configure the ocspp component within the sys.crypto.cert-validator.ocsp module using the syntax shown in the following sections. This object is associated with a certificate object to enable an OCSPP request for updating the certificate status.

**CREATE/MODIFY**

```
create ocspp [name]
modify ocspp [name]
```

options:  
cache-error-timeout [integer]  
cache-timeout [indefinite | [integer] ]  
concurrent-connections-limit [integer]  
clock-skew [integer]  
description [string]  
dns-resolver [name]  
proxy-server-pool [name]  
responder-url [none | [string] ]  
route-domain [name]  
sign-hash [sha1 | sha256]  
signer-cert [name]  
signer-key [name]  
signer-key-passphrase [none | [string] ]  
status-age [integer]  
strict-resp-cert-check [disabled | enabled]  
timeout [indefinite | [integer] ]  
trusted-responders [none | [name] ]

DISPLAY  
list ocspl [name]

DELETE  
delete [all | [name]]  
options:  
recursive

DESCRIPTION  
You can use the ocspl component to create, modify, display or delete a custom OCSPL cert-validator.

The OCSPL cert-validator is associated with a certificate object.

EXAMPLES  
create cert-validator my\_ocspl dns-resolver name  
Creates an OCSPL cert-validator named my\_ocspl using the DNS resolver specified by name.

OPTIONS  
cache-error-timeout  
Specifies the lifetime of an error response in the cache, in seconds. The default value is 3600 seconds.  
cache-timeout  
Specifies the lifetime of the OCSPL response in the cache, in seconds. The actual time period for which the response is cached is the minimum of the response validity period and the cache-timeout. The default value is indefinite, indicating that the response validity period takes precedence.  
concurrent-connections-limit  
Specifies the maximum number of connections per second allowed for the OCSPL cert-validator.  
clock-skew  
Specifies the tolerable absolute difference in the clocks of the responder and the BIG-IP, in seconds. The default value is 300.  
description  
User defined description.  
dns-resolver  
Specifies the DNS resolver object used for fetching the OCSPL response.  
partition  
Displays the administrative partition within which this validator resides.  
proxy-server-pool  
Specifies the proxy server pool used for fetching the OCSPL response.  
responder-url  
Specifies the absolute URL that overrides the OCSPL responder URL obtained from the certificate's AIA extension(s). This should be an HTTP-based URL.  
route-domain  
Specifies the route domain for fetching an OCSPL response using HTTP forward proxy.  
sign-hash  
Specifies the hash algorithm used for signing the OCSPL request. The default value is sha256.  
signer-cert  
Specifies the certificate corresponding to the key used for signing the OCSPL request.  
signer-key  
Specifies the key used for signing the OCSPL request.  
signer-key-passphrase  
Specifies the passphrase of the key used for signing the OCSPL request.  
status-age  
Specifies the maximum allowed lag time for the 'thisUpdate' time in the OCSPL response that the BIG-IP accepts. If this maximum is exceeded, the response is dropped. If this value is set to 0, this validation is skipped. The default value is 86400 seconds.

**strict-resp-cert-check**  
If enabled, the responder's certificate is checked for an OCSF signing extension. The default value is disabled.

**timeout**  
Specifies the time interval (in seconds) that the BIG-IP waits for before ending the connection to the OCSF responder. The default value is 8.

**trusted-responders**  
Specifies the certificates used for validating the OCSF response when the responder's certificate has been omitted from the response.

## sys crypto cert

**NAME**  
cert - Manage cryptographic certificates on the BIG-IP(r) system.

**MODULE**  
sys crypto

**SYNTAX**  
Manage cryptographic certs using the syntax in the following section.

**CREATE**

```
create cert [name]
options:
  city [string]
  common-name [string]
  consumer
    [enterprise-manager | iquery | iquery-big3d | ltm | webserver]
  country [string]
  email-address [string]
  key [string]
  lifetime [days]
  organization [string]
  ou [string]
  state [string]
  subject-alternative-name [string]
```

**INSTALL**

```
install cert [name]
options:
  cert-validation-options [none | ocsf]
  cert-validators [none | [cert_validator_name]]
  consumer
    [enterprise-manager | iquery | iquery-big3d | ltm | webserver]
  from-editor
  from-local-file [filename]
  from-url [URL]
  issuer-cert [none | [issuer_cert_name]]
  no-overwrite
```

**MODIFY**

```
modify cert [name]
options:
  cert-validation-options [none | ocsf]
  cert-validators [none | [cert_validator_name]]
  issuer-cert [none | [issuer_cert_name]]
```

**DELETE**

```
delete cert [name]
```

**DESCRIPTION**

You can use the cert component to create, install, and delete cryptographic certificates, and bundles.

**EXAMPLES**

```
create cert example key testkey.key common-name "My Company Inc."
country "US"
```

Generates a self signed certificate named "example.crt". A key with the specified name "testkey.key" in this case must be installed on the system in order for this operation to succeed. The cert extension (".crt") will be appended to the created cert name if it is not already provided in the name.

```
create cert /myfolder/example key testkey.key common-name "My Company Inc." country "US"
```

Similar to above, but creates the cert "example.crt" in the folder "/myfolder" instead of the default "/Common". The specified folder "/myfolder" must already exist in order for this operation to succeed.

```
create cert server2 key server2.key common-name "My Company Inc." country "US" consumer webservers
```

Generates a self-signed certificate named server2.crt. The consumer attribute, "webservers", is used to cause the files to be placed directly in the path which can be found by the BIG-IP system httpd. A pre-existing key named "server2.key" must exist in the web server's key path in order for this operation to succeed. Please note that for non LTM consumer's key and cert names must be the same.

```
install cert example from-editor
```

Opens an interactive editor session into which can be pasted a certificate for import into the BIG-IP system. A certificate file-object will be created with the name example which contains the contents saved from the editor session.

```
install cert example from-local-file /tmp/example.crt
```

Obtains a certificate from the file located at /tmp/example.crt.

```
install cert example from-url http://example.com/example.crt
```

Obtains a certificate from a remote host, based on the URI specified.

```
modify sys crypto cert leaf.crt issuer-cert issuer.crt cert-validators add { my_ocsp1 } cert-validation-options { ocsp }
```

Assigns issuer certificate issuer.crt to the certificate leaf.crt, associates the OCSP certificate validator my\_ocsp to the certificate, and enables the OCSP certificate validator for this certificate.

```
delete cert example.crt
```

Deletes the certificate "example.crt" from the system.

#### OPTIONS

**cert-validation-options**

Specifies the option used for validating the certificate status.

**cert-validators**

Specifies the name of the cert-validators used for validating the certificate status. Each cert-validation type can only have one cert-validator.

**city** Specifies the x509 city field to be used in creation of the certificate.

**common-name**

Specifies the x509 common-name to be used in creation of the certificate.

**consumer**

Specifies the system component by which a certificate will be consumed. The default behavior is to create file-objects for use by ltm components. This is the same as specifying "ltm" for this property. If a component other than "ltm" is specified then files will be installed/created in locations where the specified components can find them. For example, for component "webservers", certificates will be placed in the webservers ssl directories.

**country**

Specifies the x509 country to be used in creation of the certificate. The country must be a 2 letter country code.

**email-address**

Specifies the x509 email-address to be used in creation of the certificate.

**from-editor**

Specifies that the certificate should be obtained from a text editor session. This allows certificates to be imported via cut-n-paste from another location as long as they are in a text representation.

**from-local-file**

Specifies a local file path from which a certificate is to be copied.

**from-url**

Specifies a URI which is to be used to obtain a certificate for import into the system.

The URL syntax is protocol dependent. Supported schemes are "HTTP", "HTTPS", "FTP", "FTPS" & "FILE."

**issuer-cert**

Specifies the name of the issuer certificate for this certificate.

**no-overwrite**

Specifies option of not overwriting a certificate if it is in the scope.

**key** Specifies a key from which a certificate should be generated when using the create command.

**organization**  
Specifies the x509 organization to be used in creation of the certificate.

**ou** Specifies the x509 organizational unit to be used in creation of the certificate.

**state**  
Specifies the x509 state or province of the certificate.

**subject-alternative-name**  
Specifies standard X.509 extensions as shown in RFC 2459. Allowed values e.g. DNS:example.com, IP:192.168.1.1, IP:12:34, email:user@example.com, URI:http://www.example.com

**SEE ALSO**

create, install, modify, delete, tmsh

## sys crypto check-cert

**NAME**

check-cert - Examines certificates and displays or logs any that have expired on the BIG-IP(r) system.

**MODULE**

sys crypto

**SYNTAX**

Run a check on the expiration date of LTM certificates, in the sys crypto module by using the syntax below.

**RUN**

```
run check-cert [certificate-file-name]
options:
  ignore-large-cert-bundles [enabled | disabled]
  log [enabled | disabled]
  stdout [enabled | disabled]
  verbose [enabled | disabled]
```

**DESCRIPTION**

You can use the check-cert command to check the expiration date of certificate(s) and print the results to the screen and/or log them to /var/log/ltm.

**OPTIONS**

**ignore-large-cert-bundles**  
Specifies whether or not to ignore large certificate bundles which contain more than 20 certificates. By default it will not be ignored, i.e., it will still check every certificate bundle if this option is not specified.

**log** Specifies whether results should be logged or not. By default they will be logged.

**stdout**

Specifies whether results should be printed to STDOUT or not. By default they will be printed.

**verbose**

Specifies whether verbose output should be emitted or not, such as information about all certificates being checked rather than just those which return unfavorable results. By default verbose output is disabled.

**EXAMPLES**

```
run check-cert
```

Checks all certificate file-objects known by MCPD, and displays information about any certificates which have expired or which are close to expiration. By default this information is printed to the screen and logged to /var/log/ltm.

```
run check-cert default.crt
```

Runs the check on the specific certificate "default.crt"

```
run check-cert verbose
```

Displays expiration information about all certificates, not just those that have expired or have impending expirations.

run check-cert ignore-large-cert-bundles enabled

Ignore the certificate bundles with large size (the ones containing more than 20 certificates).

run check-cert log disabled

Prints the results to screen but does not log them.

run check-cert stdout disabled

Logs the results to /var/log/ltn, but does not print them to the screen.

**SEE ALSO**

run, tmsh

## sys crypto client

**NAME**

client - Manage remote crypto clients.

**MODULE**

sys crypto

**SYNTAX**

Manage crypto clients using the syntax in the following section.

**CREATE/MODIFY**

create client [name]

modify client [name]

options:

addr [ip address]

connection-reset

[disabled | enabled]

heartbeat [integer]

max-retries [integer | infinite]

port [integer]

profiles [add | delete | replace-all-with] { [profile\_name ...] }

profiles [none]

req-timeout [integer]

retry-interval [integer]

**DISPLAY**

list client

list client [ [ [name] | [globl] | [regex] ] ... ]

show client

show client [ [ [name] | [globl] | [regex] ] ... ]

**DELETE**

delete client [name]

**DESCRIPTION**

You can use the client component to manage remote crypto clients.

**EXAMPLES**

```
create client example addr 10.1.1.1 port 12100 profiles add { serverssl
tcp }
```

Creates a remote crypto client named "example" that will use a remote crypto server with the IP address "10.1.1.1" on port "12100". The remote crypto client will use SSL over a TCP connection to communicate with the remote crypto server.

**OPTIONS**

addr Specifies the IP address of the remote crypto server.

connection-reset

Resets the connection to the remote crypto server.

(enabled | disabled)

Specifies the state of the remote crypto client. The default value is enabled.

heartbeat

Specifies the number of seconds to wait before sending a heartbeat request. A value of 0 disables the sending of heartbeat requests. The default value is 30 seconds.

**max-retries**  
Specifies the maximum number of times to retry connecting to the remote crypto server.

If the maximum retries value is infinite, the crypto client retries connecting until a connection is made.

The default value is infinite.

**port** Specifies the port used by the remote crypto server.

**profiles**  
Specifies a list of profiles that the remote crypto client will use to communicate with remote the remote crypto server.

**req-timeout**  
Specifies the timeout in milliseconds for crypto requests to complete. The default value is 5000 milliseconds.

**retry-interval**  
Specifies the interval in seconds between attempts to connect to the remote crypto server. The default value is 10 seconds.

**SEE ALSO**

create, delete, glob, list, modify, regex, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys crypto crl

**NAME**  
crl - Manage certificate revocation lists on the BIG-IP(r) system.

**MODULE**  
sys crypto

**SYNTAX**  
Manage crls using the syntax in the following section.

**INSTALL**  
install crl [name]  
options:  
ca-file [filename]  
consumer  
[enterprise-manager | iquery | iquery-big3d | ltm | webserver]  
from-editor  
from-local-file [filename]  
from-url [URL]

**DELETE**  
delete crl [name]

**DESCRIPTION**  
You can use the crl component to install, and delete certificate revocation lists. The file-objects created by these operations can be used in other BIG-IP system configuration blocks such as ssl profiles.

**EXAMPLES**  
install crl example from-editor

Opens an interactive editor session into which can be pasted a crl for import into the BIG-IP system. A crl file-object will be created with the name example which contains the contents saved from the editor session.

install crl example from-local-file /tmp/example.crl

Obtains a crl from the file located at /tmp/example.crl and installs it as example.crl. The crl extension (".crl") will be appended to the installed crl name if it is not already provided in the name.

install crl /myfolder/myexample from-local-file /tmp/example.crl

Similar to above, but installs the crl "myexample.crl" in folder "/myfolder" instead of the default "/Common". The specified folder "/myfolder" must already exist in order for this operation to succeed.

install crl example from-url http://example.com/example.crl

Obtains a crl from a remote host, based on the URI specified.

```
delete crl example.crl
```

Deletes the certificate revocation list "example.crl" from the system.

#### OPTIONS

##### consumer

Specifies the system component by which the certificate revocation list will be consumed. The default behavior is to create file-objects for use by ltm components. This is the same as specifying "ltm" for this property. If a component other than "ltm" is specified then files will be installed/created into locations where the specified components can find them. For example, for component "webserver", crls will be placed in the webserver's ssl directories.

##### from-editor

Specifies that the crl should be obtained from a text editor session. This allows crls to be imported via cut-n-paste from another location as long as they are in a text representation.

##### from-local-file

Specifies a local file path from which the crl is to be copied.

##### from-url

Specifies a URI which is to be used to obtain the crl for import into the configuration of the system.

The URL syntax is protocol dependent. Supported schemes are "HTTP", "HTTPS", "FTP", "FTPS" & "FILE."

#### SEE ALSO

## sys crypto csr

#### NAME

csr - Manage cryptographic certificate signing requests on the BIG-IP(r) system.

#### MODULE

sys crypto

#### SYNTAX

Manage cryptographic CSRs using the syntax in the following section.

##### CREATE

```
create csr [name]
```

##### options:

```
challenge-password [string]
admin-email-address [string]
city [string]
common-name [string]
consumer
[enterprise-manager | iquery | iquery-big3d | ltm | webserver]
country [string]
email-address [string]
key [string]
organization [string]
ou [string]
state [string]
subject-alternative-name [string]
```

##### SHOW

```
show csr
```

##### LIST

```
list csr [name]
```

##### DELETE

```
delete csr [name]
```

#### DESCRIPTION

You can use the csr component to create, show, list and delete cryptographic certificate signing requests.

#### EXAMPLES

```
create csr example key testkey.key common-name "My Company Inc."
country "US" challenge-password "abcd"
```

Generates a certificate signing request named "example.csr" with

provided common-name, country and challenge-password attributes. A key with the specified name "testkey.key" in this case must be installed on the system in order for this operation to succeed. The csr extension (".csr") will be appended to the created csr name if it is not already provided in the name.

```
create csr /myfolder/example key testkey.key common-name "My Company Inc." country "US" challenge-password "abcd"
```

Similar to above, but creates the csr "example.csr" in the folder "/myfolder" instead of the default "/Common". The specified folder "/myfolder" must already exist in order for this operation to succeed.

```
create csr server2 key server2.key common-name "My Company Inc." country "US" consumer webservers
```

Generates a certificate signing request named "server2.csr". The consumer attribute, "webservers", is used to cause the files to be placed directly in the path which can be found by the BIG-IP system httpd. A pre-existing key named "server2.key" must exist in the web server's key path in order for this operation to succeed.

```
show csr
```

Shows the number of certificate signing requests installed in the system.

```
list csr example.csr
```

Lists all details of the certificate signing request "example.csr". A csr with the specified name "example.csr" in this case must already be installed on the system in order for this operation to succeed. Because only one certificate signing request name is specified in the list command, it will also display the contents of the certificate signing request file.

```
list csr example1.csr example2.csr
```

Lists all details of the certificate signing requests "example1.csr" and "example2.csr". Because more than one certificate signing request name is specified in the list command, it will not display the contents of the certificate signing request files.

```
list csr
```

Lists details of all certificate signing requests that are configured in the system. This command does not display the contents of the certificate signing request files.

```
delete csr example.csr
```

Deletes the certificate signing request "example.csr" from the system.

#### OPTIONS

##### challenge-password

Specifies the PKCS#9 challenge-password field to be used in creation of the certificate signing request.

##### admin-email-address

Specifies the administrator email-address to be used in creation of the certificate signing request.

city Specifies the x509 city field to be used in creation of the certificate signing request.

##### common-name

Specifies the x509 common-name to be used in creation of the certificate signing request.

##### consumer

Specifies the system component by which a certificate signing request will be consumed. The default behavior is to create file-objects for use by ltm components. This is the same as specifying "ltm" for this property. If a component other than "ltm" is specified then files will be installed/created in locations where the specified components can find them. For example, for component "webservers", certificate signing requests will be placed in the webservers ssl directories.

##### country

Specifies the x509 country to be used in creation of the certificate signing request. The country must be a 2 letter country code.

##### email-address

Specifies the x509 email-address to be used in creation of the certificate signing request.

key Specifies a key from which a certificate signing request should be generated when using the create command.

##### organization

Specifies the x509 organization to be used in creation of the certificate signing request.

ou Specifies the x509 organizational unit to be used in creation of the certificate signing request.

##### state

Specifies the x509 state or province to be used in creation of the certificate signing request.

##### subject-alternative-name

Specifies standard X.509 subject alternative extensions as shown

in RFC 2459 to be used in creation of the certificate signing request. Examples of allowed types are : DNS:example.com, IP:192.168.1.1, IP:12:34, email:user@example.com, URI:http://www.example.com

## sys crypto encrypted-attributes

**NAME**

encrypted-attributes - Displays all objects in the MCP binary database that contain items encrypted with the master key for the BIG-IP(r) system.

**MODULE**

sys crypto

**SYNTAX**

Display a list of objects with attributes encrypted with the master-key in the binary database using the syntax in the following section.

**DISPLAY**

show encrypted-attributes  
options:  
field-fmt

**DESCRIPTION**

You can use the encrypted-attributes command to help diagnose master-key problems in the BIG-IP(r) system. Only users with the Administrator role or the Resource Administrator role can view the list of objects with encrypted attributes.

**EXAMPLES**

show encrypted-attributes

Displays, in a table, information about the system's objects with encrypted-attributes including type, object name, attribute name, and whether or not the encrypted value in the binary database can be decrypted with the current master-key.

show master-key field-fmt

Displays, in field format, information about the system's objects with encrypted-attributes.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

show, tmsh

## sys crypto fips external-hsm

**NAME**  
external-hsm - Configures parameters for external HSM FIPS hardware.

**MODULE**  
sys crypto fips

**DESCRIPTION**  
You can use the external-hsm command to set parameters about the HSM vendor name and the password to login to the external HSM hardware.

**SYNTAX**  
Configures FIPS external-hsm within the sys crypto fips module using the syntax in the following section.

**CREATE**  
create external-hsm  
modify external-hsm vendor [thales | safenet | none]  
modify external-hsm password [password]  
modify external-hsm num-threads [no. of threads]

**DISPLAY**  
list external-hsm  
list external-hsm vendor  
list external-hsm password  
list external-hsm num-threads

**DELETE**  
delete external-hsm

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys crypto fips key

**NAME**  
key - Manage FIPS keys

**MODULE**  
sys crypto fips

**SYNTAX**  
Manage cryptographic keys within the sys crypto fips module using the syntax in the following section.

**SHOW**  
show key [key ID]  
options:  
field-fmt

all-properties  
include-public-keys

DELETE  
delete key [key ID]

DESCRIPTION  
You can use the key component to show and delete cryptographic keys contained in the FIPS hardware.

EXAMPLES

show key

Displays the list of all private keys stored in the FIPS hardware and their meta-data.

show key bef8221fd25a27cda51b3904bc2f5fb8

Displays information specifically about the FIPS key with the key ID "bef8221fd25a27cda51b3904bc2f5fb8".

show key field-fmt

Displays, in field format, information about private keys stored in the FIPS hardware.

show key all-properties

Displays all information about the FIPS contained private keys, including: handle, a numerical value used by the FIPS hardware to identify individual keys; modulus-length, the cryptographic modulus length of the key; and modulus, the modulus associated with the key, displayed as a string of hex octets separated by colons.

show key include-public-keys

Displays the list of all private and public keys stored in the FIPS hardware and their meta-data. Note that public keys are not displayed by default and need not exist for normal operation of FIPS hardware.

delete key bef8221fd25a27cda51b3904bc2f5fb8

Deletes the FIPS key with the key ID "bef8221fd25a27cda51b3904bc2f5fb8" from the system.

OPTIONS

include-public-keys

Specifies that public keys should be selected for output in addition to private.

For information about the options that you can use with the command show, see help show.

SEE ALSO

install key [name]
options:
  consumer
    [enterprise-manager | iquery | iquery-big3d | ltm | webserver]
  from-editor
  from-local-file [filename]
  from-url [URL]
  no-overwrite
```

#### DELETE

```
delete key [name]
```

#### DESCRIPTION

You can use the key component to create, show, list, install, and delete cryptographic keys, and associated cryptographic objects. The file-objects created by these operations can be used in other BigIP configuration blocks such as ssl profiles.

#### EXAMPLES

```
create key mykey
```

Generates a 2048-bit (default-sized) RSA key file object named "mykey.key". The appropriate extension will be added to the generated key/cert if not already a part of the provided name.

```
create key mykey key-type ec-private curve-name prime256v1
```

Generates a prime256v1 curve name EC private key file object named "mykey.key". The appropriate extension will be added to the generated key/cert if not already a part of the provided name.

```
create key /myfolder/mykey
```

Similar to above, but creates the key "mykey.key" in folder "/myfolder" instead of the default "/Common". The specified folder "/myfolder" must already exist in order for this operation to succeed.

```
create key example gen-cert gen-csr common-name "My Company Inc."
country "US"
```

Generates a 2048-bit (default-sized) RSA key file object named "example.key" and a self signed certificate named "example.crt". Also, a certificate signing request will be printed to the console for use in obtaining a signed certificate from a certificate authority if desired.

```
create key my gen-cert gen-csr prompt-for-password common-name "My
Company Inc." country "US"
```

Similar to above, creates key "my.key" but also prompts for a password to be used as a challenge password in the certificate authority signing procedure.

```
create key server2 gen-cert gen-csr common-name "My Company Inc."
country "US" consumer webserver
```

Generates a key and self signed certificate identified by server2. The consumer attribute, "webserver", is used to cause these files to be placed directly in the paths which can be found by the BigIP's httpd.

```
show key
```

Shows the number of keys installed in the system.

```
list key example.key
```

Lists all details of the key named "example.key". A key with the specified name "example.key" in this case must already be installed on the system in order for this operation to succeed.

```
list key
```

Lists all details of all keys installed in the system.

```
install key example from-editor
```

Opens an interactive editor session into which can be pasted a key for import into the BigIP system. A key file-object will be created with the name example which contains the contents saved from the editor session.

```
install key example from-local-file /tmp/example.key
```

Obtains a key from the file located at /tmp/example.key.

install key example from-url http://example.com/my.key

Obtains a key from a remote host, based on the URI specified.

delete key example.key

Deletes the key "example.key" from the system.

#### OPTIONS

challenge-password

Specifies the challenge password to create the certificate request key.

admin-email-address

Specifies the administrator email-address to be used in creation of the certificate request associated with the given key.

city Specifies the x509 city field to be used in creation of the certificate associated with the given key.

common-name

Specifies the x509 common-name to be used in creation of the certificate associated with the given key.

consumer

Specifies the system component by which a key and/or associated cryptographic file will be consumed. The default behavior is to create file-objects for use by ltm components. This is the same as specifying "ltm" for this property. If a component other than "ltm" is specified then files will be installed/created into locations where the specified components can find them. For example, for component "webserver", keys and certs will be placed in the webserver's ssl directories.

country

Specifies the x509 country to be used in creation of the certificate associated with the given key. The country must be a 2 letter country code.

curve-name

Specifies the curve name to be used in creation of elliptic curve (EC) key. This option applies only when generating EC keys. Default value is prime256v1.

email-address

Specifies the x509 email-address to be used in creation of the certificate associated with the given key.

from-editor

Specifies that the key should be obtained from a text editor session. This allows keys to be imported via cut-n-paste from another location as long as they are in a text representation.

from-local-file

Specifies a local file path from which a key is to be copied.

from-url

Specifies a URI which is to be used to obtain a key for import into the configuration of the system.

The URL syntax is protocol dependent. Supported schemes are "HTTP", "HTTPS", "FTP", "FTPS" & "FILE."

no-overwrite

Specifies option of not overwriting a key if it is in the scope.

gen-certificate

Specifies that in addition to generating a key, a self-signed certificate will also be created. If this option is specified then x509 attributes should also be specified. Minimally, you must also specify a common-name.

gen-csr

Specifies that a certificate signing request should be generated along with the key. The CSR will be displayed to the terminal for the purposes of use in getting a certificate signed by an outside authority. X509 attributes must also be specified.

key-size

Specifies the size, in bits, of the key to be generated. This option does not apply when generating EC keys.

key-type

Specifies the type of cryptographic key to be generated. Default is rsa-private.

lifetime

Specifies the certificate life time to be used in creation of the certificate associated with the given key.

organization

Specifies the x509 organization to be used in creation of the certificate associated with the given key.

ou Specifies the x509 organizational unit to be used in creation of the certificate associated with the given key.

prompt-for-password

Specifies that a password should be prompted for and then used as a challenge password in generation of the CSR (Certificate Signing Request).

security-type

Specifies the level of security used in storing the key in question. For example a security-type of FIPS means that the key should be stored on a FIPS card if one is available.

**state**

Specifies the x509 state or province of the certificate associated with the given key.

**passphrase**

Specifies an optional passphrase with which the key has been protected. It may be used by consumers of the key in the data-plane or control-plane to decrypt it.

**subject-alternative-name**

Specifies standard X.509 extensions as shown in RFC 2459. Allowed values e.g. DNS:example.com, IP:192.168.1.1, IP:12:34, email:user@example.com, URI:http://www.example.com

## sys crypto master-key

**NAME**

master-key - Displays the configuration of the master key for the BIG-IP(r) system.

**MODULE**

sys crypto

**SYNTAX**

Display the configuration of the master-key component within the sys crypto module using the syntax in the following section.

**DISPLAY**

show master-key

options:  
field-fmt

**MODIFY**

modify master-key

options:  
prompt-for-password

**RUN**

run master-key diagnostic

**DESCRIPTION**

You can use the master-key command to manipulate the system master key. Users with the Administrator role or the Certificate Manager role can set the key to a value of their choosing by using the 'prompt-for-password' option during a modify operation. All other roles, including Resource Administrators, are prohibited from setting the master key.

Use the 'diagnostic' option of the run command to test the key integrity.

**EXAMPLES**

show master-key

Displays, in a table, information about the system's master key.

show master-key field-fmt

Displays, in field format, information about the system's master key.

run master-key diagnostic

Loads the device key. Uses the device key to decrypt the master key file to test the integrity of the keys. On success, there is no output. There will be a response only if there is an error.

modify master-key prompt-for-password

Create a master-key based on a word or phrase of your choosing. You can use this to manually synchronize several devices without having to copy keys between them.

## OPTIONS

For information about the options that you can use with the command show, see help show.

## sys crypto pkcs12

### NAME

pkcs12 - Install pkcs12 keys and certificates on the BIG-IP(r) system.

### MODULE

sys crypto

### SYNTAX

Install keys and certificates from pkcs12 files using the syntax in the following section.

#### INSTALL

```
install pkcs12 [name]
options:
  consumer
  [enterprise-manager | iquery | iquery-big3d | ltm | webserver]
  from-local-file [filename]
  from-url [URL]
  key-passphrase
  key-security-type
  [fips | password | normal]
  passphrase [passphrase]
  no-overwrite
```

### DESCRIPTION

You can use the pkcs12 component to install cryptographic keys and certificates from pkcs12 formatted files. The file-objects created by these operations can be used in other BigIP configuration blocks such as ssl profiles.

### EXAMPLES

```
install pkcs12 example from-local-file /tmp/example.p12
```

Obtains a pkcs12 from the file located at /tmp/example.p12, and installs the key and certificate from that file as file-objects named "example.key" and "example.crt" respectively.

```
install pkcs12 /myfolder/example from-local-file /tmp/example.p12
```

Similar to above, but installs the key "example.key" and cert "example.crt" in folder "/myfolder" instead of the default "/Common". The specified folder "/myfolder" must already exist in order for this operation to succeed.

```
install pkcs12 example prompt-for-password from-local-file
/tmp/example.p12
```

Same as above but also prompts for a password which is to be used to decrypt the pkcs12 file.

```
install pkcs12 my from-url http://example.com/my.p12
```

Obtains a pkcs12 file from a remote host, based on the URL specified.

```
install pkcs12 server consumer webserver from-local-file
/tmp/example.p12
```

Obtains a pkcs12 file from /tmp/example.p12 and installs the key and certificate from that file as file-objects that can be used by the "webserver". The consumer attribute, "webserver", is used to cause these files to be placed directly in the paths which can be found by the BigIP's httpd.

### OPTIONS

#### consumer

Specifies the system component by which a key and associated certificate from a PKCS12 file will be consumed. The default behavior is to create file-objects for use by ltm components. This is the same as specifying "ltm" for this property. If a component other than "ltm" is specified then files will be installed/created into locations where the specified components can find them. For

example, for component "webservers", keys and certs will be placed in the webservers ssl directories.

**from-local-file**  
Specifies a local file path from which the contents of the PKCS12 are to be read.

**from-url**  
Specifies a URI which is to be used to obtain a PKCS12 for import into the configuration of the system.

The URL syntax is protocol dependent. Supported schemes are "HTTP", "HTTPS", "FTP", "FTPS" & "FILE."

**key-passphrase**  
Specifies the passphrase to be used to encrypt the key.

**key-security-type**  
Specifies the security type of the key. Default is set to "normal".

**passphrase**  
Specifies the passphrase to be used to decrypt the PKCS12 file.

**no-overwrite**  
Specifies option of not overwriting key/certificate if they are in the scope.

**SEE ALSO**

install, tmsh

**COPYRIGHT**

## sys crypto server

**NAME**

server - Manage remote crypto servers.

**MODULE**

sys crypto

**SYNTAX**

Manage crypto servers using the syntax in the following section.

**CREATE/MODIFY**

```
create server [name]
modify server [name]
options:
  addr [ip address]
  clients [add | delete | replace-all-with] { [ip_addr/prefixlen ...] }
  clients [none]
  [disabled | enabled]
  port [integer]
  profiles [add | delete | replace-all-with] { [profile_name ...] }
  profiles [none]
```

**DISPLAY**

```
list server
list server [ [name] | [globl] | [regex] ] ... ]
show server
show server [ [name] | [globl] | [regex] ] ... ]
```

**DELETE**

```
delete server [name]
```

**DESCRIPTION**

You can use the server component to manage remote crypto servers.

**EXAMPLES**

```
create server example addr 10.1.1.1 port 12100 profiles add { clientssl
tcp }
```

Creates a remote crypto server named "example" that will listen for remote crypto clients on IP address "10.1.1.1" and port "12100". The remote crypto server will use SSL over a TCP connection to communicate with remote crypto clients.

**OPTIONS**

**addr** Specifies the IP address of the remote crypto server.

**clients**

Specifies a list of allowed client IP addresses and subnets. An

empty list allows all clients.

(enabled | disabled)  
Specifies the state of the remote crypto server. The default value is enabled.

port Specifies the port used by the remote crypto server.

profiles  
Specifies a list of profiles that the remote crypto server will use to communicate with remote crypto clients.

**SEE ALSO**

create, delete, glob, list, modify, regex, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys daemon-ha

**NAME**  
daemon-ha - Configures high availability for a BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Configure the daemon-ha component within the sys module using the syntax in the following sections.

**MODIFY**  
modify daemon-ha [name]  
options:  
heartbeat [enabled | disabled]  
heartbeat-action [go-offline | go-offline-downlinks-restart | go-offline-restart | reboot | restart | restart-all]  
running [enabled | disabled]

edit daemon-ha [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list daemon-ha  
list daemon-ha [ [name] | [glob] | [regex] ] ... ]  
show running-config daemon-ha  
show running-config daemon-ha [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
not-running-action  
one-line  
running-timeout

**DESCRIPTION**  
You can use the daemon-ha component to configure the daemons on the system that handle high availability for the BIG-IP system.

**EXAMPLES**  
modify daemon-ha bigd running disabled  
Disables the bigd daemon.  
list daemon-ha bigd running-timeout  
Displays the running timeout of the bigd daemon.

**OPTIONS**  
glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

heartbeat  
Specifies whether heartbeat monitoring is enabled for the specified daemon. If monitoring is enabled and the daemon does not maintain its heartbeat the action specified by the value of the heartbeat-action option is taken.

The default value is enabled for all daemons, except the named daemon, which is disabled by default.

heartbeat-action

Specifies the action the system takes if the specified daemon does not maintain its heartbeat.

The default value is dependent on the specified daemon, the most common default value is restart.

**name** Specifies a unique name for the component. This option is required for the command modify.

**not-running-action**  
Specifies the action that the system takes if the daemon is not running. This option is read-only.

The default value is dependent on the specified daemon, the most common default value is go-offline-downlinks.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**running**  
Specifies whether the running-timeout and non-running-action options are enabled. The default value is dependent on the specified daemon, the most common default value is enabled.

**Note:** This feature is implemented only for the daemons: tmm, mcpd, bcm56xxd, bigd, gtmd, clusterd, tmrouted, bd, datasyncd and tmrouted.

**running-timeout**  
Specifies the amount of time (in seconds) that must elapse before the specified daemon is considered to be not running. This option is read-only.

The default value is dependent on the specified daemon.

**SEE ALSO**

edit, glob, list, modify, regex, show, tmsh

## sys daemon-log-settings clusterd

**NAME**

clusterd - Changes the log-level of or displays information about the daemon clusterd.

**MODULE**

sys daemon-log-settings

**SYNTAX**

Configure the clusterd component within the sys daemon-log-settings module using the syntax in the following sections.

**MODIFY**

modify clusterd

options:

log-level [critical | debug | error | informational | notice | warning]

edit clusterd

options:

all-properties  
non-default-properties

**DISPLAY**

list clusterd

options:

all-properties  
non-default-properties  
one-line

**DESCRIPTION**

You can use the clusterd component to change the level of the messages about the clusterd daemon that appear in the system logs. Additionally, you can display information about the daemon.

**EXAMPLES**

list clusterd

Displays information about the clusterd daemon.

```
modify clusterd log-level critical
```

Changes the level of the messages about the clusterd daemon that display in the system log to critical.

#### OPTIONS

log-level

Specifies the level of log messages for the specified daemon that you want to display in the system log.

#### SEE ALSO

edit, list, modify, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys daemon-log-settings csyncd

#### NAME

csyncd - Changes the log-level of or displays information about the daemon csyncd.

#### MODULE

sys daemon-log-settings

#### SYNTAX

Configure the csyncd component within the sys daemon-log-settings module using the syntax in the following sections.

#### MODIFY

```
modify csyncd
```

options:

```
log-level [critical | debug | error | informational | notice | warning]
```

```
edit csyncd
```

options:

```
all-properties  
non-default-properties
```

#### DISPLAY

```
list csyncd
```

options:

```
all-properties  
non-default-properties  
one-line
```

#### DESCRIPTION

You can use the csyncd component to change the level of the messages about the csyncd daemon that appear in the system logs. Additionally, you can display information about the daemon.

#### EXAMPLES

```
list csyncd
```

Displays information about the csyncd daemon.

```
modify csyncd log-level critical
```

Changes the level of the messages about the csyncd daemon that display in the system log to critical.

#### OPTIONS

log-level

Specifies the level of log messages for the specified daemon that you want to display in the system log.

#### SEE ALSO

edit, list, modify, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys daemon-log-settings icr-eventd

**NAME**  
icr-eventd - Changes the log level of the daemon icr-eventd.

**MODULE**  
sys daemon-log-settings

**SYNTAX**  
Configure the icr-eventd component within the sys daemon-log-settings module using the syntax in the following sections.

**MODIFY**  
modify icr-eventd  
options:  
log-level [ critical | debug | error | informational | notice | warning ]

edit icr-eventd  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list icr-eventd  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
You can use the icr-eventd component to change the ltm log level of the icr-eventd daemon.

**EXAMPLES**  
list icr-eventd  
  
Displays log level of the icr-eventd daemon.  
  
modify icr-eventd log-level warning  
  
Changes the log level of the icr-eventd daemon to warning.

**OPTIONS**  
log-level  
Specifies the level of log messages for the icr-eventd daemon in the ltm logs.

**SEE ALSO**  
edit, list, modify, tmsh

## sys daemon-log-settings icrd

**NAME**  
icrd - Changes or displays the audit level of the daemon icrd.

**MODULE**  
sys daemon-log-settings

**SYNTAX**  
Configure the icrd component within the sys daemon-log-settings module using the syntax in the following sections.

**MODIFY**  
modify icrd  
options:

```
audit [ none | modifications | all ]

edit icrd
options:
  all-properties
  non-default-properties

DISPLAY
list icrd
options:
  all-properties
  non-default-properties
  one-line

DESCRIPTION
  You can use the icrd component to change the audit level of the icrd
  daemon.

EXAMPLES
  list icrd

  Displays audit log level of the icrd daemon.

  modify icrd audit all

  Changes the audit level of the icrd daemon to all. This means that all
  commands executed by the icrd daemon get audited

OPTIONS
  audit
  Specifies the audit level of log messages for the icrd daemon in
  the audit logs.

SEE ALSO

## sys daemon-log-settings lind

```
NAME
  lind - Changes the log-level of or displays information about the
  daemon lind.

MODULE
  sys daemon-log-settings

SYNTAX
  Configure the lind component within the sys daemon-log-settings module
  using the syntax in the following sections.

MODIFY
  modify lind
  options:
    log-level [critical | debug | error | informational | notice |
    warning]

  edit lind
  options:
    all-properties
    non-default-properties

DISPLAY
list lind
options:
  all-properties
  non-default-properties
  one-line

DESCRIPTION
  You can use the lind component to change the level of the messages
  about the lind daemon that appear in the system logs. Additionally, you
  can display information about the daemon.

EXAMPLES
  list lind

  Displays information about the lind daemon.

  modify lind log-level critical

  Changes the level of the messages about the lind daemon that display in
```

the system log to critical.

#### OPTIONS

log-level

Specifies the level of log messages for the specified daemon that you want to display in the system log.

#### SEE ALSO

## sys daemon-log-settings mcpd

#### NAME

mcpd - Changes the log-level of or displays information about the daemon mcpd.

#### MODULE

sys daemon-log-settings

#### SYNTAX

Configure the mcpd component within the sys daemon-log-settings module using the syntax in the following sections.

#### MODIFY

modify mcpd

options:

audit [all | disabled | enabled | verbose]  
log-level [alert | critical | debug | emergency | error |  
informational | notice | panic | warning]

edit mcpd

options:

all-properties  
non-default-properties

#### DISPLAY

list mcpd

options:

all-properties  
non-default-properties  
one-line

#### DESCRIPTION

You can use the mcpd component to change the level of the messages about the mcpd daemon that appear in the system logs. Additionally, you can display information about the daemon.

#### EXAMPLES

list mcpd

Displays information about the mcpd daemon.

modify mcpd log-level critical

Changes the level of the messages about the mcpd daemon that display in the system log to critical.

#### OPTIONS

audit

Enables or disables auditing for the mcpd daemon, and specifies verbose or all as the auditing level. The default is disabled.

log-level

Specifies the level of log messages for the specified daemon that you want to display in the system log.

#### SEE ALSO

edit, list, modify, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

edit tmm

##### options:

all-properties  
non-default-properties

#### DISPLAY

list tmm

##### options:

all-properties  
non-default-properties  
one-line

### DESCRIPTION

You can use the tmm component to change the level of the messages about the tmm that appear in the system logs. Additionally, you can display information about the tmm.

### EXAMPLES

```
list tmm
```

Displays information about the tmm.

```
modify tmm http-compression-log-level critical
```

Changes the level of the messages about HTTP compression that display in the system log to warning.

### OPTIONS

arp-log-level

Specifies the lowest level of ARP messages from the tmm daemon to include in the system log. The default value is warning.

http-compression-log-level

Specifies the lowest level of HTTP compression messages from the tmm daemon to include in the system log. The default value is error.

http-log-level

Specifies the lowest level of HTTP messages from the daemon to include in the system log. The default value is error.

ip-log-level

Specifies the lowest level of IP address messages from the tmm daemon to include in the system log. The default value is warning.

irule-log-level

Specifies the lowest level of iRule messages from the tmm daemon to include in the system log. The default value is warning.

layer4-log-level

Specifies the lowest level of Layer 4 messages from the tmm daemon to include in the system log. The default value is notice.

net-log-level

Specifies the lowest level of network messages from the tmm daemon to include in the system log. The default value is warning.

**os-log-level**  
Specifies the lowest level of operating system messages from the tmm daemon to include in the system log. The default value is notice.

**pva-log-level**  
Specifies the lowest level of PVA messages from the tmm daemon to include in the system log. The default value is informational.

**ssl-log-level**  
Specifies the lowest level of SSL messages from the tmm daemon to include in the system log. The default value is warning.

**SEE ALSO**

edit, list, modify, tmsh

## sys datastor

**NAME**  
datastor - Configures the data storage used for optimization.

**MODULE**  
sys

**SYNTAX**  
Configure the datastor component within the sys module using the syntax in the following sections.

**MODIFY**  
modify datastor  
options:  
dedup-cache-weight [integer]  
description [string]  
disk [disabled | enabled]  
high-water-mark [integer]  
low-water-mark [integer]  
web-cache-weight [integer]

**DISPLAY**  
list datastor  
show running-config datastor  
options:  
all-properties  
cache-size  
non-default-properties  
one-line  
store-size

**DESCRIPTION**  
You can use the datastor component to configure disk I/O operations and optimized page cache for frequently accessed sectors. Note that symmetric data deduplication is one consumer of this storage space.

**EXAMPLES**  
list datastor all-properties  
  
Displays the data storage settings.  
  
modify datastor disk disabled  
  
Disables data storage on the disk.

**OPTIONS**  
cache-size  
Displays the size of the data storage in megabytes (MB).

dedup-cache-weight  
Specifies the relative weight of the dedup cache for the Acceleration Manager module. The default value is 10.

description  
User defined description.

disk Enables or disables the use of the disk (in addition to memory) for data storage.

If you enable or disable data storage on the disk, you must then restart the datastor service from the command line using the command sequence bigstart restart datastor.

**high-water-mark**  
Specifies the percentage of full cache above which pruning starts.  
The valid range is 60 - 100 percent. The default value is 92.

**low-water-mark**  
Specifies the percentage of full cache below which pruning stops.  
The valid range is 10 - 90 percent. The default value is 80.

**store-size**  
Displays the amount of space for each disk path specified.

**web-cache-weight**  
Specifies the relative weight of the web cache for the  
Acceleration Manager module. The default value is 10.

**SEE ALSO**

wom deduplication, list, modify, show, tmsh

**COPYRIGHT**

## sys db

**NAME**  
db - Displays or modifies bigdb database entries.

**MODULE**  
sys

**SYNTAX**  
Configure the db component within the sys module using the syntax in the following sections.

**MODIFY**  
modify db [name] value [database variable value]  
modify db [name] reset-to-default

**DISPLAY**  
list db  
list db [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
default-value  
non-default-properties  
one-line  
value  
value-range

show running-config db  
show running-config db [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties

**DESCRIPTION**  
You can use the db component to modify and retrieve the data that is stored in the bigdb configuration database.

**Important:** After you change a bigdb database variable using the db component, you must run the command sequence save config. If you do not, the next time that you run the command sequence load [config base | config], the value of the bigdb database variable may be reset to the value in the stored configuration.

Note that tmsh only displays bigdb database entries when you explicitly request them.

**EXAMPLES**  
modify db Connection.SynCookies.Threshold value 16384

Sets the database entry, SYN Check(tm) Activation Threshold, to the given value.

modify db Connection.SynCookies.Threshold reset-to-default

Sets the database entry, SYN Check(tm) Activation Threshold, back to the default value.

list log.mcpd.level

Displays the properties of the database entry log.mcpd.level:

**OPTIONS**  
default-value

Displays the system-supplied default value of the database entry.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies the unique name of the database variable. This option is required for the command modify.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**reset-to-default**  
Resets the database variable back to its default value.

**value**  
Specifies the value to which you want to set the specified database entry.

**value-range**  
Displays the type of data that you can use with the value option. The options are:

integer  
IP address  
list of valid values  
management IP address  
string  
unsigned integer

**SEE ALSO**

glob, list, modify, regex, show, tmsh

**COPYRIGHT**

## sys default-config

**NAME**

default-config - Loads the default configuration of the BIG-IP(r) system stored in the configuration files to the running configuration of the system.

**MODULE**

sys

**SYNTAX**

Configure the default-config component within the sys module using the following syntax.

**MODIFY**

load default-config

**DESCRIPTION**

You can use the default-config component to load the default system configuration to the running configuration. This results in the user-defined configuration being removed from the running configuration.

**EXAMPLES**

load default-config

Loads the default configuration stored on the system to the running configuration of the system.

**SEE ALSO**

load, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2010-03-11 sys default-config(1)

---

## sys diags ihealth-request

**NAME**  
ihealth-request - Displays the BIG-IP(r) iHealth qkview upload request status, errors and progress.

**MODULE**  
sys diags

**SYNTAX**  
Display the ihealth-request component within the sys diags module using the syntax in the following section.

**DISPLAY**  
list sys diags ihealth-request  
    all-properties  
    one-line  
  
show sys diags ihealth-request  
    raw

**DESCRIPTION**  
You can use the ihealth-request component to display the status of the iHealth upload feature.

**EXAMPLES**  
list ihealth-request  
  
Displays iHealth upload request status.

**OPTIONS**  
ihealth-start-time  
This is the start time of the ihealth request in seconds since 1970-01-01 00:00:00 UTC.  
  
ihealth-finish-time  
This is the finish time of the ihealth request in seconds since 1970-01-01 00:00:00 UTC.  
  
error  
This is the error status of the ihealth request: (one of none, creds, qkview-error, qkview-timeout, ihealth-unreach, ihealth-process, ihealth-sr-format, ihealth-timeout, ihealth-resolv, ihealth-invalid-opts, ihealth-missing-user-password, ihealth-login-failed, ihealth-missing-qkview-file, qkview-invalid-opts, ihealth-miscellaneous-error).  
  
status  
This is the status of the ihealth upload process (one of none, running, analyzing or uploading).  
  
progress  
This is the progress in percent of the upload process.  
  
type This is the type of the diagnostics request (one of none, ihealth, qkview or tcpdump).  
  
qk-progress  
This is the percent complete of a qkview in the process of being generated.  
  
qkview-filename  
This is the filename of the last qkview file generated, if there is one.  
  
qkview-date  
This is the date of the last qkview file generated, if there is one.  
  
qkview-size  
This is the file size of the last qkview file generated, if there is one.  
  
qkview-user  
This is the user name of the account that created the last qkview file generated, if there is one.  
  
tcpdump-filename  
This is the filename of the last tcpdump file generated, if there is one.  
  
tcpdump-date  
This is the date of the last tcpdump file generated, if there is one.  
  
tcpdump-size  
This is the file size of the last tcpdump file generated, if there is one.  
  
For information about the options that you can use with the command list, see help list.

SEE ALSO

list, tmsh, qkview

BIG-IP 2017-01-20 sys diags ihealth-request(1)

---

## sys diags ihealth-result

**NAME**

ihealth-result - Displays the BIG-IP(r) iHealth qkview upload results.

**MODULE**

sys diags

**SYNTAX**

Display the ihealth-result component within the sys diags module using the syntax in the following section.

**DISPLAY**

```
list ihealth-result
options:
  all-properties
  one-line
```

**DESCRIPTION**

You can use the ihealth-result component to display the result history of the iHealth upload feature.

**EXAMPLES**

```
list ihealth-result
```

Displays iHealth upload result history for the system.

**OPTIONS**

**time-checked**

This is the date and time that the qkview was uploaded to iHealth.

**check-user**

This is the iHealth user name (email address) used to access the iHealth service.

**result**

This is the result returned from iHealth.

**sr** This is the Support Request number uploaded to the iHealth service with the qkview file.

**description**

This is the description uploaded to the iHealth service with the qkview file.

**size** This is the size of the qkview file uploaded to the iHealth service.

**id** This is the iHealth ID number returned from the iHealth service for the qkview file.

**warnings**

This is the the total number of warnings returned by the iHealth service.

**criticals**

This is the the total number of critical warnings returned by the iHealth service.

For information about the options that you can use with the command list, see help list.

**SEE ALSO**

list, tmsh, qkview

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys diags ihealth

**NAME**  
ihealth - Displays the BIG-IP(r) iHealth qkview upload settings.

**MODULE**  
sys diags

**SYNTAX**  
Display and modify the ihealth component within the sys diags module using the syntax in the following section.

**MODIFY**  
modify ihealth  
options:  
user  
password  
expiration  
options

**DISPLAY**  
list ihealth  
options:  
all-properties  
one-line

**DESCRIPTION**  
You can use the ihealth component to display or modify the configuration of the iHealth upload feature.

**EXAMPLES**  
list ihealth  
  
Displays iHealth upload configuration information for the system.  
  
modify ihealth expiration 180  
  
Modify the expiration of iHealth upload history to 180 days.  
  
modify options "-t 180"  
  
Add a time limit of 180 seconds for qkview module execution.

**OPTIONS**  
user This is the iHealth user name (email address) used to access the iHealth service.  
  
password  
This is the iHealth password used to access the iHealth service.  
  
expiration  
This is the number of days to retain iHealth upload history. The default is 30, and the maximum is 365.  
  
options  
This is a command line string to specify qkview options.  
  
For information about the options that you can use with the command list, see help list.

**SEE ALSO**  
list, tmsh, qkview

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2015-07-30 sys diags ihealth(1)

---

**NAME**  
application-volume - Configures an application volume instance.

**MODULE**  
sys disk

**SYNTAX**  
Configure the application-volume component in the sys disk module using the syntax shown in the following sections.

**DISPLAY**  
show application-volume [name]  
list application-volume [name]

**DELETE**  
delete application-volume [name]

**DESCRIPTION**  
The application-volume component provides better granularity for managing disks. Physical disks can now be shared by several application-volumes. An application-volume is physically confined to one logical disk. The visibility of the application-volume can be confined to a particular software volume set or it can be global. No application-volume properties are allowed to be modified through tmsh or iControl(r) interfaces.

**EXAMPLES**  
delete application-volume mysqldb\_MD1.3  
Deletes an application-volume named mysqldb\_MD1.3.  
show application-volume mysqldb\_MD1.3  
Displays the configuration details of the application-volume mysqldb\_MD1.3 in a table.

**OPTION**  
logical-disk [name]  
Specifies the name of the logical disk in which the application-volume will be created.  
owner [unassigned/datastor/mysql/vcmp]  
Specifies the owner for which this application-volume is assigned. unassigned - is the default option and means the volume is not in use and nobody owns it.  
preservability [discardable/precious]  
Specifies the if application-volume can be discarded by software (for example, during module provisioning). discardable - is the default option.  
resizeable [false/true]  
Specifies the if application-volume can potentially be resized. false - is the default option.  
size [integer]  
Specifies the size of the application-volume.  
volume-set-visibility-restraint [name]  
Specifies the name of the volume set to which the application-volume is constrained, if any.

**SEE ALSO**  
delete, show, list, tmsh, sys provision, sys disk logical-disk

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

**BIG-IP** 2016-03-14 sys disk application-volume(1)

---

## sys disk directory

**NAME**  
directory - Manages resizing of system directories.

**MODULE**  
sys disk

**SYNTAX**  
Configure the directory component in the sys disk module using the syntax shown in the following sections.

**MODIFY**  
modify directory [directory\_name]

**options:**  
new-size [new\_size]

**SHOW**  
show directory

**DESCRIPTION**

The directory component assists in resizing system directories. It allows system administrators to increase the size of 4 system directories (/config, /shared, /var, /var/log). This allows more flexible management of the system resources and path for growing the directory sizes on case per case basis.

**EXAMPLES**

modify directory /shared new-size 35000

Increases the size of /shared system directory to 35 MiB.

show directory

Displays a table with currently scheduled directories for resizing. If there are no such directories the output is empty.

**SEE ALSO**

modify, show, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2009-2013. All rights reserved.

**BIG-IP** 2013-11-20 sys disk directory(1)

---

## sys disk logical-disk

**NAME**  
logical-disk - Manages logical disks.

**MODULE**  
sys disk

**SYNTAX**  
Configure the logical-disk component in the sys disk module using the syntax shown in the following sections.

**MODIFY**  
modify logical-disk [name]  
options:  
vg-reserved [integer]  
mode [none/mixed/datastor]

**DISPLAY**  
list logical-disk [name]

**DESCRIPTION**

The logical-disk component provides better granularity for managing disks. A physical disk can now be shared by one or more logical disks. A logical disk is physically confined to one physical disk.

**EXAMPLES**

modify logical-disk foo mode mixed vg-reserved 200

Modifies the logical disk foo mode property to mixed and the vg-reserved property size to 200 MiB.

list logical-disk foo

Displays the configuration details of the logical disk named foo.

**OPTION**

mode [none/mixed/datastor/control]  
Specifies the current mode of the logical disk. The options are:

control - Indicates that the logical disk is part of a RAID array.  
datastor - Indicates that the entire disk is committed to the datastor module.

mixed - Indicates that the disk contains multiple volumes for software and/or multiple volumes for application data.

none - Indicates that the disk is not in use. This is the default option.

size [integer]  
Specifies the size (MiB) of the logical disk.

vg-free [integer]  
Specifies the usable free space (MiB) available in the logical disk.

**vg-in-use** [integer]  
Specifies the total logical disk space (MiB) in use.

**vg-reserved** [integer]  
Specifies the reserved logical disk space (MiB). This space is NOT available for provisioning.

**SEE ALSO**

modify, list, tmsh, sys provision, sys disk logical-disk

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2009-2013, 2016. All rights reserved.

## sys dns

**NAME**  
dns - Configures the Domain Name System (DNS) for the BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Modify the dns component within the sys module using the syntax shown in the following sections.

**MODIFY**  
modify dns  
options:  
description [string]  
include [string]  
name-servers [add | delete | replace-all-with] {  
  [IP address] ...  
}  
name-servers none  
number-of-dots [integer]  
search [add | delete | replace-all-with] {  
  [domain] ...  
}  
search none

edit dns  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list dns  
list dns [option]  
show running-config dns  
show running-config dns [option]  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
You can use the dns component to manage configurations by server grouping, in this case, DNS servers.

**EXAMPLES**  
modify dns name-servers add { 192.168.10.20 192.168.10.22 }  
Adds DNS name servers with the IP addresses, 192.168.10.20 and 192.168.10.22, to the BIG-IP system.

modify dns search add { siterequest.com store.siterequest.com  
  london.siterequest.com }  
Adds the host names, siterequest.com, store.siterequest.com, and london.siterequest.com, to the DNS search configuration for the BIG-IP system.

Note: When DNS searches for the host, siterequest, which is not a fully qualified domain name, it uses the IP address of the first match, in this case, siterequest.com.

show running-config dns  
Displays the running configuration of the dns component.

**OPTIONS**

description  
User defined description.

include

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using the include option. If you use this option incorrectly, you put the functionality of the system at risk.

**name-servers**  
Configures a group of DNS name servers for the BIG-IP system.

**number-of-dots**  
Configures the number of dots needed in a name before an initial absolute query will be made.

**search**  
Configures a list of domain names in a specific order. DNS uses that order when searching for host names that are not fully qualified. You can use this option to delete domain names in the list.

SEE ALSO  
edit, list, modify, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys ecm config

**NAME**  
config - Configures Elastic Compute Manager cluster.

**MODULE**  
sys ecm

**SYNTAX**  
Modify the configuration for ECM module using the syntax shown in the following sections.

**MODIFY**  
modify config  
options:  
seed-ip [string]  
dns-resolver [string]

edit config  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list config  
options:  
auth [string]  
seed-ip [string]  
dns-resolver [string]  
status [string]

**OPTIONS**  
You can use these options with the config component:

**auth** Displays the authorization credentials to access ECM cluster. Authorization credentials are obtained by registering the BIG-IP with the ECM cluster. Refer to register command within the ECM module.

**seed-ip**  
Specifies the host name or IP address of the seed node of the ECM cluster.

**dns-resolver**  
Specifies the BIG-IP DNS resolver to use for host name resolution.

**status**  
Displays the status

SEE ALSO

---

## sys ecm register

**NAME**  
register - Registers this BIG-IP with ECM cluster.

**MODULE**  
sys ecm

**SYNTAX**  
Initiate the registration of this BIG-IP with the ECM cluster.  
Registration enables the BIG-IP to access services running in the ECM cluster.

**RUN**  
run register

**SEE ALSO**  
edit, list, modify, tmsh

**COPYRIGHT**

## sys failover

**NAME**  
failover - Configures failover for a BIG-IP(r) unit in a redundant system configuration.

**MODULE**  
sys

**SYNTAX**  
Change the failover state within the sys module using the syntax in the following section.

**MODIFY**  
run failover  
options:  
device [string]  
no-persist  
offline  
online  
persist  
standby  
traffic-group [[string] | default | non-default | none]

**DISPLAY**  
show failover  
options:  
cable

**DESCRIPTION**  
Failover is the process where a standby unit in a redundant system configuration takes over when a software or hardware failure is detected on the active unit.

**EXAMPLES**

**run failover standby**

Causes the active unit or cluster to go into the standby state forcing the other unit or cluster in the redundant system configuration to become active.

**run failover offline**

Causes the active unit or cluster to go into the Forced Offline state.

**run failover online**

Changes the status of a unit or cluster from Forced Offline to either Active or Standby, depending upon the status of the other unit or cluster in a redundant system configuration.

**show failover**

Displays the failover state of the BIG-IP system (active, standby, offline) and how long it has been in that state.

**run failover standby device my\_bigip**

Specifies that the my\_bigip device should become the active device for all traffic groups.

**run failover standby traffic-group traffic\_grp01**

Specifies that the traffic group named traffic\_grp01 should fail over to the Standby state. The traffic group will then become Active on another device.

**run sys failover offline no-persist**

Changes the status of a unit to Forced Offline and indicates that the change will not be persisted after a system restart.

**run sys failover offline persist**

Changes the status of a unit to Forced Offline and indicates that the change will be persisted after a system restart.

#### OPTIONS

Use these options to control failover of the system:

**device**

Specifies the device that should next become the active device for the specified traffic group or all traffic groups (if a traffic group is not specified). This option may only be specified with the standby option.

**no-persist**

Does not persist the change in status of a unit. The option is valid only with the offline state.

**offline**

Changes the status of a unit or cluster to Forced Offline. If persist or no-persist options are not specified, the default action is to persist the offline status of the unit between system restarts.

**online**

Changes the status of a unit or cluster from Forced Offline to either Active or Standby, depending upon the status of the other unit or cluster in a redundant system configuration.

**persist**

Persists the change in status of a unit. The option is valid only with the offline state.

**standby**

Specifies that the active unit or cluster fails over to a Standby state, causing the standby unit or cluster to become Active.

**traffic-group**

Specifies the traffic-group that should fail over to the Standby state, the traffic-group will become Active on another device. This option may only be specified with the standby option.

Use this option to display the failover cable status of the system:

**cable**

Displays the status that the failover daemon detects on the serial cable from its failover peer. It also shows what the failover peer detects on the serial cable. An active BIG-IP system will see a zero from its failover peer. A standby BIG-IP system will see a one from its failover peer.

## sys feature-module

**NAME**  
feature-module - Enables or disables a feature module on the BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Configure the feature-module component within the sys module using the syntax in the following sections.

**MODIFY**  
modify feature-module  
modify feature-module [ [all] | [cgnat] ]  
options:  
enabled | disabled

edit feature-module  
[ [ [cgnat] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list feature-module  
list feature-module  
[ [ [cgnat] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
You can use the feature-module component to modify the availability of any licensed feature modules on your system.

**EXAMPLES**  
modify feature-module cgnat enabled  
Enables the BIG-IP Carrier Grade NAT module.  
  
modify feature-module cgnat disabled  
Disables the BIG-IP Carrier Grade NAT module.  
  
list feature-module  
Displays the current feature module of the system.

**OPTIONS**  
all Specifies that you are enabling or disabling all of the available modules.

cgnat  
Specifies that you are enabling or disabling the BIG-IP Carrier Grade NAT module.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**  
edit, glob, list, modify, regex, show, tmsh, provision

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2012-2013. All rights reserved.

BIG-IP 2013-04-12 sys feature-module(1)

**NAME**  
 apache-ssl-cert - Manages an Apache SSL certificate file.

**MODULE**  
 sys file

**SYNTAX**  
 Configure the apache-ssl-cert component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**  
 create apache-ssl-cert [name]  
 modify apache-ssl-cert [name]  
 options:  
 source-path [URL]

**DISPLAY**  
 list apache-ssl-cert  
 list apache-ssl-cert [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**  
 delete apache-ssl-cert [name]

**DESCRIPTION**  
 You can use the apache-ssl-cert component to create, delete, list or modify an SSL certificate.

**EXAMPLES**  
 create apache-ssl-cert new-cert source-path  
 http://cert-server/cert\_store/certs/cert1.crt  
 Downloads the certificate from the given URL into file-store, creates an SSL certificate file named new-cert, and saves the given URL in the source-path attribute.  
 create apache-ssl-cert new-cert source-path file:/shared/save/cert1.crt  
 Specifies the location of the file on the local disk (use this when the file has already been created on the local disk).

**SUPPORTED URL FORMAT**  
 Supported URL schemes are HTTP, HTTPS, FTP, FTPS, and FILE.

**OPTIONS**

**bundle-certificates**  
 Lists data about all the certificates in the bundle, if the certificate file is a bundle; otherwise, this field will be none.

**certificate-key-curve-name**  
 Specifies the Elliptical Curve name of the cryptographic key associated with this certificate. This field will be set to none if an Elliptical Curve key is not present.

**certificate-key-size**  
 Specifies the number of bits in the key associated with this certificate.

**checksum**  
 Specifies a cryptographic hash or checksum of the file contents for use in verification of file integrity.

**create-time**  
 Specifies the time at which the file-object was created.

**created-by**  
 Specifies the user who originally created the file-object.

**expiration-date**  
 Specifies the date at which this certificate expires. Stored as a POSIX time.

**expiration-string**  
 Specifies a string representation of the expiration date of the certificate.

**fingerprint**  
 Specifies the cryptographic fingerprint of the certificate.

**is-bundle**  
 Specifies whether the certificate file is a bundle (that is, whether it contains more than one certificate).

**issuer**  
 Specifies X509 information of the certificate's issuer. If the cert is a bundle, this displays the issuer information for the primary (first) cert in the bundle.

**key-type**  
 Specifies the type of cryptographic key associated with this certificate.

**last-update-time**  
 Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**partition**  
 Specifies the administrative partition where the certificate resides.

**revision**

Identifies the latest revision of the file. The revision starts with 1 and gets incremented on each update.

**serial-number**  
Specifies the certificate's serial number.

**size** Specifies the size (in bytes) of the file associated with this file object.

**source-path [URL]**  
This attribute takes a URL, for example:

**source-path** http://cert-server/cert\_store/certs/vs\_132.crt

**source-path** https://cert-server/cert\_store/certs/vs\_132.crt

**source-path**  
**ftp://username:password@server/cert\_store/certs/vs\_132.crt**

**subject**  
Specifies X509 information of the certificate's subject. If the cert is a bundle, this displays the subject information for the primary (first) cert in the bundle.

**subject-alternative-name**  
Specifies a standard X.509 extension as shown in RFC 2459.

**updated-by**  
Specifies the user who last updated the file-object.

**version**  
Specifies the X509 version of the certificate.

## sys file browser-capabilities-db

**NAME**  
browser-capabilities-db - Manages a browser capabilities DB file.

**MODULE**  
sys file

**SYNTAX**  
Configure the browser-capabilities-db component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create browser-capabilities-db [name]  
modify browser-capabilities-db [name]  
options:  
source-path [URL]

**DISPLAY**  
list browser-capabilities-db  
list browser-capabilities-db [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**  
delete browser-capabilities-db [name]

**DESCRIPTION**  
You can use the browser-capabilities-db component to create, delete, list or modify an browser capabilities DB file.

**EXAMPLES**  
create browser-capabilities-db dcdB source-path  
file:/shared/images/dcdB

Loads the browser capabilities file from the given path on the local disk into file-store and creates an file named dcdB.

**OPTIONS**  
checksum  
A cryptographic hash or checksum of the file contents for use in verification of file integrity.  
create-time  
Specifies the time at which the file-object was created.

**created-by**  
Specifies the user who originally created the file-object.

**last-update-time**  
Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**revision**  
Specifies the latest revision of the file. The revision starts with 1 and gets incremented on each update.

**size** Specifies the size (in bytes) of the file associated with this file object.

**source-path [path]**  
This attribute takes an absolute path on the local disk, for example:

```
source-path file:/shared/images/filename
```

**updated-by**  
Specifies the user who last updated the file-object.

**SEE ALSO**

create, delete, glob, list, modify, regex, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys file data-group

**NAME**  
data-group - Manages an external data group file.

**MODULE**  
sys file

**SYNTAX**  
Manage the data-group component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create data-group [name]  
modify data-group [name]  
options:  
  app-service [[string] | none]  
  data-group-description [string]  
  data-group-name [name]  
  separator [string]  
  source-path [URL]  
  type [integer | ip | string ]  
  
edit data-group [ [ [name] | [glob] | [regex] ] ... ]  
  
**DISPLAY**  
list data-group  
list data-group [ [ [name] | [glob] | [regex] ] ... ]  
  
**DELETE**  
delete data-group [name]

**DESCRIPTION**  
You can use the data-group component to create, edit, delete, list or modify an external data group file.

**EXAMPLES**  
create data-group new-dg source-path  
http://file-server/data-groups/acl.class type string  
  
Downloads the data-group file from the given URL into file-store,  
creates an external-data-group file named new-dg, and saves the given  
URL in the source-path attribute.  
  
create data-group new-dg source-path  
http://file-server/data-groups/acl.class type string data-group-name dg  
data-group-description "created for rule xyz"  
  
Downloads the data-group file from the given URL into file-store,  
creates an external-data-group file named new-dg, saves the given URL

in the source-path attribute, and creates an external data group within the ltm data-group module named dg with the given description.

create data-group new-dg source-path file:/shared/save/Test.cls type ip

Specifies the location of the file on the local disk (use this when the file has already been created on the local disk).

#### SUPPORTED URL FORMAT

Supported URL schemes are HTTP, HTTPS, FTP, FTPS, and FILE.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### checksum

Specifies a cryptographic hash or checksum of the file contents for use in verification of file integrity.

##### created-by

Specifies the user who originally created the file-object.

##### create-time

Specifies the time at which the file-object was created.

##### data-group-description

Specifies the description of the external data group that will be created within the ltm data-group module and reference the given data group file. This is optional in the create command.

##### data-group-name

Specifies the name of the external data group that will be created within the ltm data-group module and reference the given data group file. This is optional in the create command.

##### last-update-time

Specifies the last time at which the file-object was updated/modified.

mode Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

##### revision

The latest revision of the file. The revision starts with 1 and gets incremented on each update.

##### separator

Specifies a separator to use when defining the data group. The default value is :=.

size Specifies the size (in bytes) of the file associated with this file object.

##### source-path [URL]

This attribute takes a URL, for example:

source-path http://file-server/data-groups/AUL\_1.cls

source-path https://file-server/data-groups/CNN.x

source-path

ftp://username:password@server/data-groups/latest.class

source-path file:/shared/save/Test.dat

type Specifies the kind of data in the group. This option is required by the create command.

Possible values for type are:

- o integer
- o ip
- o string

##### updated-by

Specifies the user who last updated the file-object.

#### SEE ALSO

create, delete, edit, glob, list, ltm data-group external, modify, regex, tmsh

## sys file device-capabilities-db

**NAME**  
device-capabilities-db - Manages a device capabilities DB file.

**MODULE**  
sys file

**SYNTAX**  
Configure the device-capabilities-db component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create device-capabilities-db [name]  
modify device-capabilities-db [name]  
options:  
source-path [URL]

**DISPLAY**  
list device-capabilities-db  
list device-capabilities-db [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**  
delete device-capabilities-db [name]

**DESCRIPTION**  
You can use the device-capabilities-db component to create, delete, list or modify an device capabilities DB file.

**EXAMPLES**  
create device-capabilities-db dcdb source-path file:/shared/images/dcdb  
  
Loads the device capabilities file from the given path on the local disk into file-store and creates an file named dcdb.

**OPTIONS**

**checksum**  
A cryptographic hash or checksum of the file contents for use in verification of file integrity.

**create-time**  
Specifies the time at which the file-object was created.

**created-by**  
Specifies the user who originally created the file-object.

**last-update-time**  
Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**revision**  
Specifies the latest revision of the file. The revision starts with 1 and gets incremented on each update.

**size** Specifies the size (in bytes) of the file associated with this file object.

**source-path [path]**  
This attribute takes an absolute path on the local disk, for example:  
source-path file:/shared/images/filename

**updated-by**  
Specifies the user who last updated the file-object.

**SEE ALSO**  
create, delete, glob, list, modify, regex, tmsh

## sys file external-monitor

**NAME**  
external-monitor - Manages an external monitor file.

**MODULE**  
sys file

**SYNTAX**  
Manage the external-monitor component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create external-monitor [name]  
modify external-monitor [name]  
options:  
app-service [[string] | none]  
source-path [URL]  
  
edit external-monitor [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
list external-monitor  
list external-monitor [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**  
delete external-monitor [name]

**DESCRIPTION**  
You can use the external-monitor component to create, edit, delete, list or modify an external-monitor file.

**EXAMPLES**  
create external-monitor new-mon source-path  
http://file-server/external-monitors/mon\_app1  
  
Downloads the monitor file from the given URL into file-store, creates an external-monitor file named new-mon, and saves the given URL in the source-path attribute.  
  
create external-monitor new-mon source-path file:/shared/save/Test.mon  
  
Specifies the location of the file on the local disk (use this when the file has already been created on the local disk).

**SUPPORTED URL FORMAT**  
Supported URL schemes are HTTP, HTTPS, FTP, FTPS, and FILE.

**OPTIONS**

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**checksum**  
Specifies a cryptographic hash or checksum of the file contents for use in verification of file integrity.

**created-by**  
Specifies the user who originally created the file-object.

**create-time**  
Specifies the time at which the file-object was created.

**last-update-time**  
Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**revision**  
The latest revision of the file. The revision starts with 1 and gets incremented on each update.

**size** Specifies the size (in bytes) of the file associated with this file object.

**source-path [URL]**  
This attribute takes a URL, for example:  
  
source-path  
http://file-server/external-monitors/monitor\_service  
  
source-path  
https://file-server/external-monitors/custom\_mon.1  
  
source-path  
ftp://username:password@server/external-monitors/tested.mon

**updated-by**  
Specifies the user who last updated the file-object.

**SEE ALSO**  
create, delete, edit, glob, list, ltm monitor external, modify, regex, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys file ifile

**NAME**  
ifile - Manages an iFile file.

**MODULE**  
sys file

**SYNTAX**  
Manage the ifile component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create ifile [name]  
modify ifile [name]  
options:  
app-service [[string] | none]  
source-path [URL]  
  
edit ifile [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
list ifile  
list ifile [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**  
delete ifile [name]

**DESCRIPTION**  
You can use the ifile component to create, edit, delete, list or modify an iFile file.

**EXAMPLES**  
create ifile new-ifile source-path http://tmp/text.txt  
  
Downloads the iFile file from the given URL into file-store and creates an ifile file named new-ifile. Saves the given URL in the source-path attribute.  
  
Supported URL schemes are "HTTP", "HTTPS", "FTP", "FTPS" & "FILE"

**OPTIONS**  
**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.  
  
**checksum**  
A cryptographic hash or checksum of the file contents for use in verification of file integrity.  
  
**created-by**  
Specifies the user who originally created the file-object.  
  
**create-time**  
Specifies the time at which the file-object was created.  
  
**last-update-time**  
Specifies the last time at which the file-object was updated/modified.  
  
**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.  
  
**revision**  
The latest revision of the file. The revision starts with 1 and gets incremented on each update.  
  
**size** Specifies the size (in bytes) of the file associated with this file object.  
  
**source-path [URL]**  
This attribute takes a URL, for example:  
source-path http://file-server/ifiles/AUL\_1.cls  
source-path https://file-server/ifiles/CNN.x  
  
**source-path**  
ftp://username:password@server/ifiles/latest.class  
  
**updated-by**  
Specifies the user who last updated the file-object.

**SEE ALSO**

create, delete, edit, glob, list, ltm ifile, modify, regex, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys file lwtunneltbl

**NAME**

lwtunneltbl - Manages an lwtunneltbl file.

**MODULE**

sys file

**SYNTAX**

Manage the lwtunneltbl component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**

create lwtunneltbl [name]

modify lwtunneltbl [name]

**options:**

app-service [[string] | none]

source-path [URL]

edit lwtunneltbl [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**

list lwtunneltbl

list lwtunneltbl [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**

delete lwtunneltbl [name]

**DESCRIPTION**

You can use the lwtunneltbl component to create, edit, delete, list or modify an lwtunneltbl file.

**EXAMPLES**

```
create lwtunneltbl new-ifile source-path http://tmp/text.txt
```

Downloads the lwtunneltbl file from the given URL into file-store and creates an lwtunneltbl file named new-ifile. Saves the given URL in the source-path attribute.

Supported URL schemes are "HTTP", "HTTPS", "FTP", "FTPS" & "FILE"

**OPTIONS****app-service**

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**checksum**

A cryptographic hash or checksum of the file contents for use in verification of file integrity.

**created-by**

Specifies the user who originally created the file-object.

**create-time**

Specifies the time at which the file-object was created.

**last-update-time**

Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**revision**

The latest revision of the file. The revision starts with 1 and gets incremented on each update.

**size** Specifies the size (in bytes) of the file associated with this file object.

**source-path [URL]**

This attribute takes a URL, for example:

```
source-path http://file-server/ifiles/AUL_1.cls
```

```
source-path https://file-server/ifiles/CNN.x
source-path
ftp://username:password@server/ifiles/latest.class
updated-by
Specifies the user who last updated the file-object.
```

**SEE ALSO**

create, delete, edit, glob, list, ltm ifile, modify, regex, tmsh

## sys file rewrite-rule

**NAME**

rewrite-rule - Manages a HTML content rewrite rule.

**MODULE**

sys file

**SYNTAX**

Configure the rewrite-rule component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**

create rewrite-rule [name]

modify rewrite-rule [name]

options:

local-path [URL]

edit rewrite-rule [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**

list rewrite-rule

list rewrite-rule [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**

delete rewrite-rule [name]

**DESCRIPTION**

You can use the rewrite-rule component to create, edit, delete, list or modify a HTML content rewrite rule.

**EXAMPLES**

```
create rewrite-rule new-rule local-path /shared/tmp/my_rewrite_rule
```

Creates a new HTML content rewrite rule using file located by local-path and saves path in the local-path attribute.

**OPTIONS**

**checksum**

Specifies a cryptographic hash or checksum of the file contents for use in verification of file integrity.

**created-by**

Specifies the user who originally created the file-object.

**create-time**

Specifies the time at which the file-object was created.

**last-update-time**

Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**revision**

Specifies the latest revision of the file. The revision starts with 1 and gets incremented on each update.

**size** Specifies the size (in bytes) of the file associated with this file object.

**local-path [path]**

This attribute takes a path, for example:

```
local-path /shared/tmp/my_rewrite_rule
```

**updated-by**

Specifies the user who last updated the file-object.

## sys file ssl-cert

NAME

ssl-cert - Manages a SSL certificate file.

MODULE

sys file

SYNTAX

Configure the ssl-cert component within the sys file module using the syntax shown in the following sections.

CREATE/MODIFY

create ssl-cert [name]

options:

app-service [[string] | none]

source-path [URL]

modify ssl-cert [name]

options:

app-service [[string] | none]

cert-validation-options [none | ocsf]

cert-validators [none | [cert\_validator\_name]]

issuer-cert [none | [issuer\_cert\_name]]

source-path [URL]

edit ssl-cert [ [name] | [glob] | [regex] ] ... ]

DISPLAY

list ssl-cert

list ssl-cert [ [name] | [glob] | [regex] ] ... ]

DELETE

delete ssl-cert [name]

DESCRIPTION

You can use the ssl-cert component to create, edit, delete, list or modify an SSL certificate.

EXAMPLES

```
create ssl-cert new-cert source-path
http:/cert-server/cert_store/certs/cert1.crt
```

Downloads the certificate from the given URL into file-store, creates an SSL certificate file named new-cert, and saves the given URL in the source-path attribute.

```
create ssl-cert new-cert source-path file:/shared/save/cert1.crt
```

Specifies the location of the file on the local disk (use this when the file has already been created on the local disk).

SUPPORTED URL FORMAT

Supported URL schemes are HTTP, HTTPS, FTP, FTPS, and FILE.

OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

bundle-certificates

Specifies a list of data about all the certificates in the bundle, if the certificate file is a bundle; otherwise, this field will be none.

cert-validation-options

Specifies the option used for validating the certificate status.

cert-validators

Specifies the name of the cert-validators used for validating the certificate status. At most one cert-validator can be configured for each cert-validation type.

**certificate-key-size**

Specifies the number of bits in the key associated with this certificate.

**checksum**

Specifies a cryptographic hash or checksum of the file contents for use in verification of file integrity.

**create-time**

Specifies the time at which the file-object was created.

**created-by**

Specifies the user who originally created the file-object.

**expiration-date**

Specifies the date at which this certificate expires. Stored as a POSIX time.

**expiration-string**

Specifies a string representation of the expiration date of the certificate.

**fingerprint**

Specifies the cryptographic fingerprint of the certificate.

**is-bundle**

Specifies whether the certificate file is a bundle (that is, whether it contains more than one certificate).

**issuer**

Specifies X509 information of the certificate's issuer. If the cert is a bundle, this displays the issuer information for the primary (first) cert in the bundle.

**issuer-cert**

Specifies the name of the issuer certificate for this certificate.

**key-type**

Specifies the type of cryptographic key associated with this certificate.

**last-update-time**

Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**revision**

Specifies the latest revision of the file. The revision starts with 1 and gets incremented on each update.

**serial-number**

Specifies the certificate's serial number.

**size** Specifies the size (in bytes) of the file associated with this file object.

**source-path [URL]**

This attribute takes a URL, for example:

**source-path** http://cert-server/cert\_store/certs/vs\_132.crt

**source-path** https://cert-server/cert\_store/certs/vs\_132.crt

**source-path**  
ftp://username:password@server/cert\_store/certs/vs\_132.crt

**subject**

Specifies X509 information of the certificate's subject. If the cert is a bundle, this displays the subject information for the primary (first) cert in the bundle.

**subject-alternative-name**

Specifies a standard X.509 extension as shown in RFC 2459.

**updated-by**

Specifies the user who last updated the file-object.

**version**

Specifies the X509 version of the certificate.

**SEE ALSO**

create, delete, edit, glob, list, ltm profile client-ssl, ltm profile server-ssl, modify, regex, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008-2013. All rights reserved.

## sys file ssl-crl

**NAME**  
ssl-crl - Manages a SSL CRL file.

**MODULE**  
sys file

**SYNTAX**  
Configure the ssl-crl component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**

create ssl-crl [name]

modify ssl-crl [name]

**options:**

app-service [[string] | none]

source-path [URL]

edit ssl-crl [ [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**

list ssl-crl

list ssl-crl [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**

delete ssl-crl [name]

**DESCRIPTION**

You can use the ssl-crl component to create, edit, delete, list or modify an SSL CRL file.

**EXAMPLES**

```
create ssl-crl new-crl source-path
http://cert-server/cert_store/CRLs/latest.crl
```

Downloads the CRL file from the given URL into file-store, creates an SSL CRL file named new-crl, and saves the given URL in the source-path attribute.

```
create ssl-crl new-crl source-path file:/shared/save/copy_10.crl
```

Specifies the location of the file on the local disk (use this when the file has already been created on the local disk).

**SUPPORTED URL FORMAT**

Supported URL schemes are HTTP, HTTPS, FTP, FTPS, and FILE.

**OPTIONS**

**app-service**

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**checksum**

Specifies a cryptographic hash or checksum of the file contents for use in verification of file integrity.

**created-by**

Specifies the user who originally created the file-object.

**create-time**

Specifies the time at which the file-object was created.

**last-update-time**

Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**revision**

Specifies the latest revision of the file. The revision starts with 1 and gets incremented on each update.

**size** Specifies the size (in bytes) of the file associated with this file object.

**source-path [URL]**

This attribute takes a URL, for example:

```
source-path http://cert-server/cert_store/CRLs/backup_10.crl
```

```
source-path https://cert-server/cert_store/CRLs/jan_2010.crl
```

**source-path**

```
ftp://username:password@server/cert_store/CRLs/latest.crl
```

**updated-by**

Specifies the user who last updated the file-object.

**SEE ALSO**

create, delete, edit, glob, list, ltm profile client-ssl, ltm profile server-ssl, modify, regex, tmsb

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008-2013. All rights reserved.

## sys file ssl-key

**NAME**  
ssl-key - Manages a SSL certificate key file.

**MODULE**  
sys file

**SYNTAX**  
Configure the ssl-key component within the sys file module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create ssl-key [name]  
modify ssl-key [name]  
options:  
app-service [[string] | none]  
source-path [URL]  
passphrase [passphrase]  
edit ssl-key [ [name] | [glob] | [regex] ] ... ]

**DISPLAY**  
list ssl-key  
list ssl-key [ [name] | [glob] | [regex] ] ... ]

**DELETE**  
delete ssl-key [name]

**DESCRIPTION**  
You can use the ssl-key component to create, edit, delete, list or modify an SSL certificate key file.

**EXAMPLES**  
create ssl-key new-key source-path  
http:/cert-server/cert\_store/certs/cert1.key  
Downloads the certificate-key file from the given URL into file-store and creates an SSL certificate key file named new-key. Saves the given URL in the source-path attribute.  
create ssl-key new-key source-path file:/shared/save/cert1.key  
Specifies the location of the file on the local disk. Use this when the file has already been created on the local disk.

**SUPPORTED URL FORMAT**  
Supported URL schemes are HTTP, HTTPS, FTP, FTPS, and FILE.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.  
checksum  
A cryptographic hash or checksum of the file contents for use in verification of file integrity.  
create-time  
Specifies the time at which the file-object was created.  
created-by  
Specifies the user who originally created the file-object.  
key-size  
Specifies the size of the cryptographic key associated with this file object, in bits.  
key-type  
Specifies the cryptographic type of the key in question. That is, which algorithm this key is compatible with.  
The options are:  
rsa-private  
The key is an RSA private key.  
dsa-private

The key is a DSA based private key.

**last-update-time**  
Specifies the last time at which the file-object was updated/modified.

**mode** Specifies the UNIX file permissions mode for the file associated with this file-object as a numerical value.

**passphrase [passphrase]**  
Specifies an optional passphrase with which the key has been protected. It may be used by consumers of the key in the data-plane or control-plane to decrypt it.

**revision**  
Specifies the latest revision of the file. The revision starts with 1 and gets incremented on each update.

**security-type**  
Specifies the type of security used to handle or store the key.

The options are:

**normal**  
The key resides in a standard form on the file-system. This is the default value.

**fips** The key is protected by a FIPS device on the system and is only applicable to devices with FIPS support.

**password**  
Specifies that the key is protected by a passphrase and stored in encrypted form.

**nethsm**  
The key is protected by a FIPS device outside the system.

**size** Specifies the size (in bytes) of the file associated with this file object.

**source-path [URL]**  
This attribute takes a URL, for example:

**source-path** http://cert-server/cert\_store/certs/vs\_132.key

**source-path** https://cert-server/cert\_store/certs/vs\_132.key

**source-path**  
ftp://username:password@server/cert\_store/certs/vs\_132.key

**updated-by**  
Specifies the user who last updated the file-object.

## sys fix-connection

**NAME**  
fix-connection - Displays FIX connection statistics.

**MODULE**  
sys

**SYNTAX**  
**DISPLAY**  
show fix-connection  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
all-properties  
save-to-file

**DESCRIPTION**  
You can use the fix-connection component to display statistics about FIX connections.

**EXAMPLES**  
show fix-connection

Displays FIX connection statistics in the system default units.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2014-05-19 sys fix-connection(1)

---

## sys folder

#### NAME

folder - Configure folders (directory structure) on the BIG-IP(r) system.

#### MODULE

sys

#### SYNTAX

Configure the folder component within the sys module using the syntax in the following sections.

##### CREATE/MODIFY

```
create folder [name]
modify folder [name]
```

##### options:

```
app-service [[string] | none]
description [string]
device-group [[string] | default | non-default | none]
no-ref-check [false | true]
traffic-group [[string] | default | non-default | none]
```

##### DISPLAY

```
list folder
list folder [ [name] | [glob] | [regex] | [recursive] ]
```

##### DELETE

```
delete folder [name]
```

#### DESCRIPTION

The folder system enables users to create logical containers for the purpose of granular control of synchronization to other devices in a device group.

The folder system is hierarchical, with folders and sub-folders, in a parent-to-child relationship. The highest level folder in the system is called root. For every administrative partition on the BIG-IP system, there is a top-level folder. Top-level folders always have root as the parent. Users can create sub-folders to any folder in the system.

#### EXAMPLES

```
create sys folder sub-folder1 device-group dgl traffic-group none
```

Creates a new sub-folder to the current working folder called sub-folder1, associates the folder with a device-group called dgl, and sets the traffic-group to no association.

```
modify sys folder /Common/sub-folder1/subfolder2 description "store
pools for the B2 server configuration"
```

Changes the description property of the folder indicated by its full name.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### description

User defined description.

##### device-group

Adds this folder and all configuration items in this folder to a device group for device failover or config-sync purposes. The options are:

##### default

Indicates that this folder should use the device group setting of its parent folder. If the parent folder's

associated device group is changed, this folder's device group will change as well.

#### non-default

Disassociates this folder from its parent folder's device group setting. This folder's device group field can then be set independently of the parent folder's field.

#### hidden

Folders may be hidden by setting this property to true. The `-hidden` command-line option will allow you to view hidden folders, but is not required to use or modify a folder. The `-hidden` command-line option only affects output from the `list` command and the results of tab completing a configuration item. If set to false, the folder will always be visible as long as the user has the appropriate permissions.

#### inherited-devicegroup

Specifies, when set to true, that this folder uses the device group setting of its parent folder. If the parent folder's associated device group is changed then this folder's device group will change as well. This field is read-only.

#### inherited-traffic-group

Specifies, when set to true, that this folder uses the traffic group setting of its parent folder. If the parent folder's associated traffic group is changed then this folder's traffic group will change as well. This field is read-only.

#### no-ref-check

Specifies whether strict device group reference validation is performed on configuration items in the folder. The options are:

#### false

Requires configuration items in the folder to sync to a super-set of the devices that are associated with any configuration that refers to configuration items in the folder. This is the default value.

`true` Disables this check. It is then assumed that any dependent configuration items contained in the folder will be created locally on the other devices.

#### traffic-group

Adds this folder and its configuration items to an existing traffic group. The values default and non-default work as they do for the device-group option.

#### SEE ALSO

`create`, `delete`, `glob`, `list`, `modify`, `regex`, `tmsh`

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, include photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2011-2013, 2015-2016. All rights reserved.

BIG-IP 2016-03-14 sys folder(1)

## sys fpga firmware-config

#### NAME

`firmware-config` - Configures the FPGA firmware to be used by the system.

#### MODULE

`sys fpga`

#### SYNTAX

Configure the `firmware-config` component within the `sys fpga` module using the syntax shown in the following sections.

#### MODIFY

`modify firmware-config`

#### options:

`type [ 14-performance-fpga | 17-intelligent-fpga | standard-balanced-fpga | traffic-acceleration-fpga ]`

#### DISPLAY

`list firmware-config`

#### options:

`all-properties`  
`non-default-properties`  
`one-line`

#### DESCRIPTION

You can use the `firmware-config` component to configure the FPGA firmware type to use.

#### EXAMPLES

```
list firmware-config
```

Displays properties of the current FPGA firmware configuration.

```
modify firmware-config type
```

Modify the type of the current FPGA firmware configuration. The default is standard-balanced-fpga.

#### OPTIONS

```
type The type for FPGA firmware current used on the system.
```

l4-performance-fpga: High throughput fpga firmware.

l7-intelligent-fpga: eFAD and L7 intelligent fpga firmware.

standard-balanced-fpga: The balanced standard fpga firmware.

traffic-acceleration-fpga: traffic acceleration fpga firmware.

#### SEE ALSO

```
list, modify, tmsh, fpga
```

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008, 2012-2014. All rights reserved.

BIG-IP 2016-10-10 sys fpga firmware-config(1)

---

## sys fpga info

#### NAME

info - Displays current FPGA (Field-Programmable Gate Array) firmware information on the system.

#### MODULE

```
sys fpga
```

#### SYNTAX

Displays current info component within the sys fpga module using the syntax in the following section.

#### DISPLAY

```
show info
options:
all-properties
field-fmt
```

#### DESCRIPTION

You can use the info component to display the current FPGA firmware information on the system.

#### EXAMPLES

```
show info
```

Displays current FPGA (Field-Programmable Gate Array) firmware information on the system

#### SEE ALSO

```
show, tmsh, fpga
```

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008-2014. All rights reserved.

BIG-IP 2014-03-26 sys fpga info(1)

---

## sys geoip

**NAME**  
geoip - Loads the GeoIP data files.

**MODULE**  
sys

**SYNTAX**  
Use the geoip component within the gtm module to load the GeoIP data files using the syntax in the following sections.

**LOADING**  
load geoip

**DESCRIPTION**  
The BIG-IP system ships with three default database files that are stored in the /usr/share/GeoIP/v2 directory. The three files are: F5GeoIP.dat, F5GeoIPISP.dat, and F5GeoIPv6.dat.

You can download and install updated GeoIP database files using the procedure available from the F5 download site. The installation places the updated database files in the share/GeoIP/v2 directory.

When you run the load geoip command sequence, the system loads the GeoIP files from disk into the running configuration. If you have downloaded and installed updated database files, those files are loaded from the /shared/GeoIP/v2 directory. Otherwise, the default database files are loaded from the /usr/share/GeoIP/v2 directory. Note that if both directories contain the same files, the files in shared/GeoIP/v2 are loaded.

**EXAMPLES**  
load geoip

Loads the GeoIP files from disk into the running configuration.

**SEE ALSO**  
load, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys global-settings

**NAME**  
global-settings - Configures the global system settings for a BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Configure the global-settings component within the sys module using the syntax in the following sections.

**MODIFY**  
modify global-settings  
options:

- aws-access-key [string]
- aws-secret-key [string]
- aws-api-max-concurrency [integer]
- file-blacklist-path-prefix [string]
- file-blacklist-read-only-path-prefix [string]
- file-whitelist-path-prefix [string]
- console-inactivity-timeout [integer]
- custom-addr [IP address]
- description [string]
- failsafe-action [go-offline | reboot | restart-all | go-offline-restart-tm | failover-restart-tm]
- file-local-path-prefix [local path prefix]
- gui-security-banner [disabled | enabled]
- gui-security-banner-text [string]
- gui-setup [disabled | enabled]
- host-addr-mode [custom | management | state-mirror]
- hostname [string]
- hosts-allow-include [string]
- lcd-display [disabled | enabled]
- net-reboot [disabled | enabled]
- password-prompt [string]
- mgmt-dhcp [disabled | enabled]
- quiet-boot [disabled | enabled]
- remote-host [add | delete | replace-all-with] {

```

    [name]... {
options:
  addr [IP address]
  hostname [string]
  }
  remote-host none
  username-prompt [string]
edit global-settings
options:
  all-properties
  non-default-properties

DISPLAY
list global-settings
list global-settings [option]
show running-config global-settings
show running-config global-settings [option]
options:
  all-properties
  non-default-properties
  one-line
DESCRIPTION
  You can use the global-settings component to set up the BIG-IP system.
EXAMPLES
  modify system remote-host add { bigip151 {addr 172.27.226.151 hostname
  bigip151.saxon.net} }

  Sets up a remote host named bigip151 with an IP address of
  172.27.226.151 and a hostname of bigip151.saxon.net.

  list global-settings all-properties

  Displays all of the properties of the global system settings.
OPTIONS
  aws-access-key
  Amazon Web Services (AWS) supplied access key needed to make
  secure requests to AWS. The default value is none.

  aws-secret-key
  Amazon Web Services (AWS) supplied secret key needed to make
  secure requests to AWS. The default value is none.

  aws-api-max-concurrency
  Maximum concurrent connections allowed while making Amazon Web
  Service (AWS) api calls. The default value is 1.

  file-blacklist-path-prefix
  Specifies the path prefixes that are disallowed for certain
  commands. The blacklist takes precedence over the whitelist. It is
  used by the tmsh save/load sys config file command to disallow
  saving or loading configuration. Example: The path prefix
  /shared/tmp/ is included both in the whitelist and blacklist.
  Since, it is present in the blacklist, the configuration cannot be
  saved or loaded from the /shared/tmp/ location. The paths are
  specified in braces separated by spaces in quotes. ex:
  "{/shared/3dns/} {/shared/bin/}".

  file-blacklist-read-only-path-prefix
  Specifies the read-only path prefixes that are disallowed for
  certain commands. It is used by the tmsh save/load sys config file
  command to disallow saving or loading configuration. It is a read-
  only attribute with value "{/etc/shadow}".

  file-whitelist-path-prefix
  Specifies the path prefixes that are valid for certain commands.
  It is used by the tmsh save/load sys config file command for
  saving or loading configuration. The paths are specified in braces
  separated by spaces in quotes. ex: "{/var/local/scf/} {/tmp/}
  {/shared/} {/config/}".

  console-inactivity-timeout
  Specifies the number of seconds of inactivity before the system
  logs off a user that is logged on. The default value is 0 (zero),
  which means that no timeout is set. The valid range is 0 -
  2147483647.

  custom-addr
  Specifies an IP address for the system. The default value is ::.
  The host-addr-mode option must be set to custom in order for this
  setting to take effect.

  description
  Specifies a user defined description. The default value is no
  description.

  failsafe-action
  Specifies the action that the system takes when the switch board
  fails. The default value is go-offline-restart-tm.

  failover-restart-tm
  Specifies that when the switch board fails the system
  restarts the traffic management system and fails over to the
  other unit in a redundant pair.

  go-offline
  Specifies that when the switch board fails the system goes
  offline.

  go-offline-restart-tm

```

Specifies that when the switch board fails the system goes offline and restarts the traffic management system.

#### reboot

Specifies that after the active cluster fails over to its peer, it reboots while the peer processes the traffic.

#### restart-all

Specifies that when the switch board fails the system restarts all system services.

#### file-local-path-prefix

Specifies a list of folder prefixes that can be applied for file objects. This is a space separated list of folder prefixes, contained in curly braces. Example: "{file:///shared/}" or "{file:///fileobjectfolder/} {/shared/}". By default the folders are "/shared/" and "/tmp/", represented as "{/shared/} {/tmp/}".

#### gui-security-banner

Specifies whether the system presents on the login screen the text you specify in the gui-security-banner-text option. If you disable this option, the system presents an empty frame in the right portion of the login screen. The default value is enabled.

#### gui-security-banner-text

Specifies the text to present on the login screen when the gui-security-banner option is enabled. The default value is Welcome to the BIG-IP Configuration Utility.

Note: To enter a carriage return in the text type Ctrl-V followed by Ctrl-J. Additionally, you must escape special characters, such as a question mark(?), with a back slash.

#### gui-setup

Enables or disables the Setup utility in the browser-based Configuration utility. The default value is enabled.

Note: When you configure a system using tmsh, disable this option. Disabling this option allows the system administrators to use the browser-based Configuration utility without having to run the Setup utility.

#### host-addr-mode

Specifies the type of host address you want to assign to the system. The default value is management. The options are:

#### custom

Use this value to specify a custom IP address for the system using the custom-addr option.

#### management

Indicates that the host address is the management port of the system.

#### state-mirror

Use this value when the host address of the system is shared by the other system in a redundant pair. In case of system failure, the traffic to the other system is routed to this system.

#### hostname

Specifies a local name for the system. The default value is bigip1.

#### hosts-allow-include

Warning: Do not use this parameter without assistance from the F5 Technical Support team. The system does not validate the commands issued when you use the hosts-allow-include option. If you use this option incorrectly, you put the functionality of the system at risk.

#### lcd-display

Enables or disables the LCD display on the front of the system. The default value is enabled.

#### net-reboot

Enables or disables the network reboot feature. The default value is disabled.

If you enable this feature and then reboot the system, the system boots from an ISO image on the network, rather than from an internal media drive. Use this option only when you want to install software on the system, for example, for an upgrade or a re-installation.

Note: An enabled value reverts to disabled after you reboot the system a second time.

#### password-prompt

Specifies the text to present above the password field on the system's login screen.

#### mgmt-dhcp

Specifies whether the system uses DHCP client for acquiring the management interface IP address. If this option is enabled, manually specified IP addresses for the management interface may be overwritten if the network also contains a DHCP server. If this option is disabled, no DHCP server will be applied to the management interface, however any previously acquired address will still be used. The default value is enabled for VE and disabled for all other platforms. When this option is enabled, manual changes like create/delete on management-ip will not be allowed.

#### quiet-boot

Enables or disables the quiet boot feature. The default value is enabled. When enabled, the system suppresses informational text on the console during the boot cycle.

**remote-host**

Configures a remote host in the /etc/hosts file. The default value is none. You must enter both an IP address and a fully qualified domain name (FQDN) or alias for each host that you want to add to the file.

**username-prompt**

Specifies the text to present above the user name field on the system's login screen.

**SEE ALSO**

## sys ha-group

**NAME**

ha-group - Configures the high availability (HA) scoring mechanism for a unit in a traffic group of BIG-IP(r) systems.

**MODULE**

sys

**SYNTAX**

Configure the ha-group component within the sys module using the following syntax.

**CREATE/MODIFY**

```
create ha-group [name]
modify ha-group [name]
options:
  active-bonus [integer]
  app-service [[string] | none]
  clusters none
  clusters [add | delete | modify | replace-all-with] {
    [name] {
      app-service [[string] | none]
      attribute percent-up-members
      threshold [integer]
      minimum-threshold [integer]
      sufficient threshold [integer | all]
      weight [integer]
    }
  }
  description [string]
  [disabled | enabled]
  pools none
  pools [add | delete | modify | replace-all-with] {
    [name] {
      app-service [[string] | none]
      attribute percent-up-members
      threshold [integer]
      minimum-threshold [integer]
      sufficient threshold [integer]
      weight [integer]
    }
  }
  trunks none
  trunks [add | delete | modify | replace-all-with] {
    [name] {
      app-service [[string] | none]
      attribute percent-up-members
      threshold [integer]
      minimum-threshold [integer]
      sufficient threshold [integer]
      weight [integer]
    }
  }
}
```

**DISPLAY**

```
list ha-group
list ha-group [name]
options:
  all
  all-properties
  current-module
```

one-line

DELETE  
delete ha-group [name]

#### DESCRIPTION

You can use the ha-group component to configure a high availability (HA) group that determines the HA scoring mechanism for a unit in a traffic group. This mechanism compares the relative health of the two or more units in the traffic group and the system with the highest score becomes the active unit. Note Use the attribute ha-group of the traffic group to make the association.

#### EXAMPLES

```
create ha-group group1 pools add { ftp_pool { attribute percent-up-  
members weight 70 } }
```

Creates a HA group, named group1, that includes the pool named ftp\_pool, and uses the attribute percent-up-members and a weight of 70 to determine the HA score for a unit in a traffic group.

```
list ha-group group1
```

Displays the configuration of the HA group, group1.

#### OPTIONS

##### active-bonus

Specifies a number to add to the unit's HA score when the unit is active. This option ensures that the state of a unit is dependent upon the history of its state. The default value is 10 (ten). The range is 0 - 100.

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### attribute

Specifies an attribute of the component that you want to use for the HA scoring mechanism. Percent-up-members is the only available attribute for HA scoring for the clusters, pools, and trunks options.

##### clusters

Specifies the clusters that you want to configure for the HA group. You can only configure a cluster on a chassis.

##### description

User defined description.

[disabled | enabled]

Enables or disables the HA group in the HA table. The default value is enabled.

**name** Specifies the name of the component that you want to configure. This option is required when you create, modify, or delete a HA group. This option is also required when you configure clusters, pools, or trunks for the HA group.

##### pools

Specifies the pools that you want to configure for the HA group.

##### threshold

Deprecated. Use minimum-threshold instead.

##### minimum-threshold

Specifies the minimum number of up interfaces in a trunk, up pool members in a pool, or up cluster members in a cluster below which the specified component does not contribute to the HA score for the unit. The default value is 0 (zero), which indicates this option is disabled. The value may not exceed the number of members of the trunk, pool, or cluster.

##### sufficient-threshold

Specifies the sufficient number of up interfaces in a trunk, up pool members in a pool, or up cluster members in a cluster above which the specified component is considered at 100% for its contribution to the HA score for the unit. The default value is all (or 0). The value may not exceed the number of members of the trunk, pool, or cluster.

##### trunks

Specifies the trunks that you want to configure for the HA group.

##### weight

The value of this option is multiplied by the percent of up cluster, pool, or trunk members, and is added to the HA score. The default value is 10. The range is 10 - 100.

## sys ha-status

**NAME**  
ha-status - Displays information about the high availability (HA) status of a unit in a redundant pair.

**MODULE**  
sys

**SYNTAX**  
Display information about the ha-status component within the sys module using the following syntax.

**DISPLAY**  
show ha-status  
options:  
all-properties  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
failure  
field-fmt

**DESCRIPTION**  
You can use the ha-status component to display information about the high availability status of a unit in a redundant pair.

**EXAMPLES**  
show ha-status  
  
Display information about the HA status of the unit.

**OPTIONS**  
failure  
Display only the objects that present a failure condition.  
  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys hardware

**NAME**  
hardware - Displays the BIG-IP(r) system hardware.

**MODULE**  
sys

**SYNTAX**  
Display statistics for the hardware component within the sys module using the syntax in the following section.

**DISPLAY**  
show hardware

**DESCRIPTION**

You can use the hardware component to display information about the hardware.

**EXAMPLES**

```
show hardware
```

Displays hardware information for the system.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

show, tmsh

## sys host-info

**NAME**

host-info - Displays statistics about the host.

**MODULE**

sys

**SYNTAX**

Configure the host-info component within the sys module using the syntax in the following sections.

**DISPLAY**

```
show host-info
```

**options:**

```
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
```

```
global
```

**DESCRIPTION**

You can use the host-info component to display statistics about the host, including CPU count, active CPU count, processor mode, memory usage, and more.

**EXAMPLES**

```
show host-info
```

Displays host statistics in the system default units.

```
show host-info raw
```

Displays raw host statistics.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

show, tmsh

**COPYRIGHT**

## sys httpd

**NAME**        httpd - Configures the HTTP daemon for the BIG-IP(r) system.

**MODULE**  
      sys

**SYNTAX**  
      Configure the httpd component within the sys module using the following syntax.

**CREATE/MODIFY**  
modify httpd  
  options:  
    allow [add | delete | none | replace-all-with] {  
      hostname or IP address ...  
    }  
    auth-name [string]  
    auth-pam-dashboard-timeout [off | on]  
    auth-pam-idle-timeout [integer]  
    auth-pam-validate-ip [off | on]  
    description [string]  
    fastcgi-timeout [integer]  
    hostname-lookup [double | off | on]  
    include [string]  
    log-level [alert | crit | debug | emerg | error | info | notice | warn]  
    redirect-http-to-https [disabled | enabled]  
    request-header-max-timeout [integer]  
    request-header-min-rate [integer]  
    request-header-timeout [integer]  
    request-body-max-timeout [integer]  
    request-body-min-rate [integer]  
    request-body-timeout [integer]  
    ssl-ca-cert-file [string]  
    ssl-certchainfile [string]  
    ssl-certfile [string]  
    ssl-certkeyfile [string]  
    ssl-ciphersuite [string]  
    ssl-include [string]  
    ssl-protocol [string]  
    ssl-port [integer]  
    ssl-verify-client [no | require | optional | optional-no-ca]  
    ssl-verify-depth [integer]  
    ssl-ocsp-enable [on | off]  
    ssl-ocsp-default-responder [string]  
    ssl-ocsp-override-responder [on | off]  
    ssl-ocsp-responder-timeout [integer]  
    ssl-ocsp-response-max-age [integer]  
    ssl-ocsp-response-time-skew [integer]

edit httpd  
  options:  
    all-properties  
    non-default-properties

**DISPLAY**  
list httpd  
list httpd [option name]  
show running-config httpd  
show running-config httpd [option name]  
  options:  
    all-properties  
    non-default-properties  
    one-line

**DESCRIPTION**  
      You can use the httpd component to configure the HTTP daemon for the system.

      Important: F5 Networks recommends that users of the Configuration utility exit the utility before changes are made to the system using the httpd component. This is because making changes to the system using this component causes a restart of the httpd daemon. Additionally, restarting the httpd daemon creates the necessity for a restart of the Configuration utility.

**EXAMPLES**  
modify httpd { ssl-certfile [string] ssl-certkeyfile [string] }  
  
Changes the SSL certificate and the SSL key. Note that when you change the SSL key, you must also change the SSL certificate.  
  
modify httpd auth-pam-idle-timeout 43200  
  
Sets the PAM idle timeout to half a day (in seconds).  
  
modify httpd allow replace-all-with {172.27.0.0/255.255.0.0}  
  
Replaces the existing list of hosts that can connect to the httpd daemon with the hosts in the range, 172.27.0.0/255.255.0.0.

**OPTIONS**  
  allow  
  Configures IP addresses and hostnames for the HTTP clients from which the httpd daemon accepts requests. The default value is All.  
  
  Warning: Using the value none resets the httpd daemon to allow all HTTP clients access to the system; therefore, F5 Networks recommends that you do not use the value none.  
  
  auth-name  
  Specifies the name for the authentication realm. The default value is BIG-IP.

**auth-pam-dashboard-timeout**  
Specifies whether idle timeout while viewing the dashboard is enforced or not. The default value is off.

**auth-pam-idle-timeout**  
Specifies the number of seconds of inactivity that can elapse before the GUI session is automatically logged out. The default value is 1200 seconds.

**auth-pam-validate-ip**  
Specifies whether the check for consistent inbound IP for the entire web session is enforced or not. The default value is on.

**description**  
User defined description.

**fast-cgitimeout**  
Specifies, in seconds, the timeout for FastCGI. The default value is 300 seconds.

**hostname-lookup**  
The default value is off.

**include**  
The default value is none.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the include option incorrectly, you put the functionality of the system at risk.

**log-level**  
Specifies the minimum httpd message level to include in the system log. The default value is warn.

**redirect-http-to-https**  
Specifies whether the system should redirect HTTP requests targeted at the configuration utility to HTTPS. The default value is disabled.

**request-header-max-timeout**  
Specifies, in seconds, the maximum time allowed to receive all of the request headers, if the request-header-min-rate option is used, in which case the timeout is extended as more data arrives. Ignored if request-header-min-rate is not used. A value of 0 means no limit. The default value is 40.

**request-header-min-rate**  
Specifies, in bytes per second, the minimum average rate at which the request headers must be received. A value of 0 means no limit. The default value is 500.

**request-header-timeout**  
Specifies, in seconds, the time allowed to receive all of the request headers. A value of 0 means no limit. If you use the request-header-min-rate option, this represents the initial value for the timeout, which will be extended as more data arrives. The default value is 20.

Warning: This includes the time needed to complete the initial SSL handshake. If the user's browser is configured to query certificate revocation lists and the CRL server is not reachable, the initial SSL handshake may take a significant time until the browser gives up waiting for the CRL.

**request-body-max-timeout**  
Specifies, in seconds, the maximum time allowed to receive all of the request body, if the request-body-min-rate option is used, in which case the timeout is extended as more data arrives. Ignored if request-body-min-rate is not used. A value of 0 means no limit. The default value is 0.

**request-body-min-rate**  
Specifies, in bytes per second, the minimum average rate at which the request body must be received. A value of 0 means no limit. The default value is 500.

**request-body-timeout**  
Specifies, in seconds, the time allowed for reading all of the request body. This includes the time needed to do any SSL renegotiation. A value of 0 means no limit. If you use the request-body-min-rate option, this represents the initial value for the timeout, which will be extended as more data arrives. The default value is 60.

**ssl-ca-cert-file**  
Specifies the name of the file that contains the SSL Certificate Authority (CA) certificate file. The default value is none.

**ssl-certchainfile**  
Specifies the name of the file that contains the SSL certificate chain. The default value is none.

**ssl-certfile**  
Specifies the name of the file that contains the SSL certificate. The default value is /etc/httpd/conf/ssl.crt/server.crt.

Note that the path to the file must start with either /etc/httpd/conf/ssl.crt/ or /config/httpd/conf/ssl.crt/, unless the path is a relative path. If the path is a relative path, then it must start with conf/ssl.crt/.

**ssl-certkeyfile**

hypervisor-info - Used inside of a vCMP guest to display proposed configuration information passed in from the vCMP hypervisor.

**MODULE**

sys

**SYNTAX**

Access the hypervisor-info component within the sys module using the syntax in the following sections.

**DISPLAY**

```
show hypervisor-info
options:
  field-fmt
```

**DESCRIPTION**

You can use the hypervisor-info component to display vCMP guest configuration information proposed by the vCMP hypervisor. Note that this component will only display information when used from inside a vCMP guest. On any other BIG-IP system, the show command will produce no output.

These values will override the default values for any of the corresponding configuration items inside the guest:

Proposed Address - The management IP, as configured via tmsh sys management-ip on appliances and via tmsh sys cluster on clusters.

Proposed Gateway - The default gateway, as configured via tmsh sys management-route.

Proposed Hostname - The hostname, as configured via tmsh sys global-settings.

Proposed Netmask - The management netmask. See "Proposed Address" above.

**EXAMPLES**

```
show hypervisor-info
```

Displays hypervisor configuration information in default units.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

show, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2016-03-14 sys hypervisor-info(1)

---

## sys icall event

**NAME**

event - Generate an Event on the BIG-IP(r) system.

**MODULE**

sys icall

**SYNTAX**

Generate the event component within the sys icall module using the syntax shown in the following sections.

**GENERATE**

```
generate event
options:
  name [string]
  context {
    {
      name [string]
      value [string]
    }
  }
}
```

**DESCRIPTION**

You may use the generate event command to construct a free-form Event in the system which will be sent to interested Event Handlers.

**EXAMPLES**

```
generate event name EMPLOYEE context { { first_name Sam } { last_name Shepard } }
```

Construct an event named "EMPLOYEE" that contains two pieces of information as name/value pairs. An Event Handler must be subscribed to the event by the name "EMPLOYEE" or by both event name and all the contexts in a context group.

#### OPTIONS

**context**  
Specifies a set of name/value pairs that convey the information of the Event.

name The Events name; does not have to be unique, but may not be empty.

#### SEE ALSO

create, delete, edit, list, modify, show, sys ical event-handler, sys ical script, tmsh

#### COPYRIGHT

## sys ical handler periodic

#### NAME

periodic - Make or configure a periodic handler for the BIG-IP(r) system.

#### MODULE

sys ical handler

#### SYNTAX

Modify the periodic component within the sys ical handler module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create periodic [name]
modify periodic [name]
```

##### options:

```
arguments {
  {
    name [string]
    value [string]
  }
  ...
}
```

```
description [string]
first-occurrence [date/time]
interval [integer]
last-occurrence [date/time]
script [script name]
status [active | inactive]
```

```
mv periodic [ [ [source-name] [destination-name] ] |
  [ [name] to-folder [folder-name] ] |
  [ [name...name] to-folder [folder-name] ] ]
options:
to-folder
```

##### DISPLAY

```
list periodic
list periodic [ [ [name] | [glob] | [regex] ] ... ]
show periodic
show periodic [ [ [name] | [glob] | [regex] ] ... ]
```

##### DELETE

```
delete periodic [name]
```

#### DESCRIPTION

You can create a periodic handler to run scripts automatically based on clock time.

#### EXAMPLES

```
create periodic my_handler1 script script1 first-occurrence now+1h
interval 45 arguments { { name user value j.han } { name role value
manager } }
```

Create a new periodic handler that will execute script1 every 45 seconds. The handler will wait one hour before beginning, but continue to execute indefinitely. Each 45 seconds, when the script executes, the provided arguments will be passed into the script as `EVENT::context() data`.

```
mv periodic /Common/my_periodic to-folder /Common/my_folder
```

Moves a periodic icall handler named `my_periodic` to a folder named `my_folder`, where `my_folder` has already been created and exists within `/Common`.

#### OPTIONS

##### arguments

Specifies a set of name/value pairs that will be passed to the script at the start of each execution on each interval.

The use of arguments is optional and may be changed at any time.

##### description

A user defined description of the item.

##### first-occurrence

A specific date and time for this handler to begin executing. If not specified, the current date and time of creation will be used.

##### interval

The number of seconds between each time this handler should execute.

##### last-occurrence

A specific date and time for this handler to stop executing. If not specified, the script will run indefinitely.

##### script

The iCall Tcl script the handler when execute at each time interval. Note that this script must be an object in `sys icall script`; a `cli script` will not work.

##### status

Specify either `active` or `inactive`. `Active` is the default value.

When the handler status is `active`, the handler accepts events and executes the script as expected. However, when the status is `inactive`, the handler will no longer accept incoming events and the script will not execute. Use the `inactive` status when you wish to keep the handler as a configuration item and do not wish to delete it, but also do not wish the handler to run.

##### to-folder

A periodic icall handler can be moved to any folder under `/Common`, but configuration dependencies may restrict it from moving out of `/Common`.

#### SEE ALSO

`create`, `delete`, `edit`, `list`, `modify`, `mv`, `show`, `sys icall event`, `sys icall script`, `tmsh`

#### COPYRIGHT

BIG-IP 2016-03-14 `sys icall handler periodic(1)`

---

## sys icall handler perpetual

#### NAME

`perpetual` - Make or configure a perpetual handler for the BIG-IP(r) system.

#### MODULE

`sys icall handler`

#### SYNTAX

Modify the perpetual component within the `sys icall handler` module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create perpetual [name]
modify perpetual [name]
options:
  description [string]
  script [script name]
  status [active | inactive | suspend ]
  subscriptions [add | delete | modify | replace-all-with] {
    [subscription name] {
      options:
        event-name [event name]
        filters [add | delete | modify | replace-all-with] {
          [filter name] {
            options:
          }
        }
      value [string]
```

```
match-algorithm [accept-all | exact | glob | regex | subnet]
    }
}
}
```

```
restart perpetual [name]
start perpetual [name]
stop perpetual [name]
```

```
mv perpetual [ [ [source-name] [destination-name] ] |
    [ [name] to-folder [folder-name] ] |
    [ [name...name] to-folder [folder-name] ] ]
```

```
options:
    to-folder
```

```
DISPLAY
list perpetual
list perpetual [ [ [name] | [glob] | [regex] ] ... ]
show perpetual
show perpetual [ [ [name] | [glob] | [regex] ] ... ]
```

```
DELETE
delete perpetual [name]
```

#### DESCRIPTION

You can create a perpetual handler to run continuously executing code and to receive events by specifying subscriptions.

#### EXAMPLES

```
create perpetual my_handler1 script script1 subscriptions add { sub1 {
event-name LTM_POOL_UP } }
```

Creates a new perpetual handler run the program defined in "script1". Anytime an event called "LTM\_POOL\_UP" is generated in the system, a copy will be sent to my\_handler1.

```
mv perpetual /Common/my_perpetual to-folder /Common/my_folder
```

Moves a perpetual icall handler named my\_perpetual to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

#### OPTIONS

##### description

A user defined description of the item.

##### script

The iCall Tcl script the handler will execute upon creation. The user is responsible for creating a script with perpetual execution. If the script is changed, the handler will not change its executing code until the handler is restarted or put into inactive and then active status.

Note that this script must be an object in sys icall script; a cli script will not work.

##### status

Specify active, inactive, or suspend. Active is the default value.

Inactive status indicated that the handler is to no longer execute and to no longer receive events. The handler's state is lost and all pending events are deleted. Use this status to eliminate a handler in the system but to keep its information stored.

The handler may also be set to suspend which will keep the handler script executing, but the system will send no new events to the handler. Events waiting to be processed remain in queue.

##### subscriptions

Create one or more subscription items to specify the conditions of this handler's execution. The handler subscribes generally to events by the event name, and specifically to data by using filters. The use of filters is optional.

The handler will be sent events by the system as defined by the subscription property, but the code inside the handler must use EVENT::get\_next function in order to receive the data into the handler. See sys icall script for more information.

##### to-folder

A perpetual icall handler can be moved to any folder under /Common, but configuration dependencies may restrict it from moving out of /Common.

#### SEE ALSO

create, delete, edit, list, modify, mv, show, sys icall event, sys icall script, tmsh

#### COPYRIGHT

## sys icall handler triggered

**NAME**  
triggered - Make or configure an event-triggered handler for the BIG-IP(r) system.

**MODULE**  
sys icall handler

**SYNTAX**  
Modify the triggered component within the sys icall handler module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create triggered [name]  
modify triggered [name]  
options:  
  description [string]  
  script [script name]  
  status [active | inactive]  
  subscriptions [add | delete | modify | replace-all-with] {  
    [subscription name] {  
      options:  
        event-name [event name]  
        filters [add | delete | modify | replace-all-with] {  
          [filter name] {  
            options:  
              value [string]  
              match-algorithm [accept-all | exact | glob | regex | subnet]  
            }  
          }  
        }  
      }  
    }  
  }  
mv triggered [ [ [source-name] [destination-name] ] | [ [name] to-folder [folder-name] ] | [ [name...name] to-folder [folder-name] ] ] options:  
  to-folder

**DISPLAY**  
list triggered  
list triggered [ [ [name] | [glob] | [regex] ] ... ]  
show triggered  
show triggered [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**  
delete triggered [name]

**DESCRIPTION**  
You can create a triggered handler to automatically run a script when a specified event occurs.

**EXAMPLES**  
create triggered my\_handler1 script script1 subscriptions add { pools { event-name LTM\_POOL\_UP filters add { pool\_name { value pool1 } node\_name { value node1 } } } }  
  
Creates a new triggered handler that will execute the script called "script1" when an event called "LTM\_POOL\_UP" is generated in the system and contains the contexts { pool\_name, pool1 } and { node\_name, node1 }.  
  
mv triggered /Common/my\_triggered to-folder /Common/my\_folder  
  
Moves a triggered icall handler named my\_triggered to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

**OPTIONS**  
**description**  
A user defined description of the item.  
  
**script**  
The iCall Tcl script the handler will execute when invoked by an appropriate event. Note that this script must be an object in sys icall script; a cli script will not work.  
  
**status**  
Specify either active or inactive. Active is the default value.  
  
When the handler status is active, the handler accepts events and executes the script as expected. However, when the status is inactive, the handler will no longer accept incoming events and the script will not execute. Use the inactive status when you wish to keep the handler as a configuration item and do not wish to delete it, but also do not wish the handler to run.  
  
**subscriptions**  
Specify one or more subscriptions to define the conditions of this handler's execution. The handler subscribes generally to events by the event name, and specifically to data by using filters. The use of filters is optional.  
  
A handler that specifies more than one subscription will execute when any one subscription is matched to an event.

to-folder

A triggered icall handler can be moved to any folder under /Common, but configuration dependencies may restrict it from moving out of /Common.

**SEE ALSO**

create, delete, edit, list, modify, mv, show, sys icall event, sys icall script, tmsh

**COPYRIGHT**

---

## sys icall istats-trigger

**NAME**

istats-trigger - Configure an iStats trigger to generate a user defined event for the iCall feature on the BIG-IP(r) system.

**MODULE**

sys icall

**SYNTAX**

Modify the istats-trigger component within the sys icall module using the syntax shown in the following sections.

**CREATE/MODIFY**

create istats-trigger [name]

modify istats-trigger [name]

options:

description [string]

duration [integer]

event-name [string]

istats-key [string]

range-max [integer]

range-min [integer]

repeat [integer]

mv istats-trigger [ [ [source-name] [destination-name] ] |

[ [name] to-folder [folder-name] ] |

[ [name...name] to-folder [folder-name] ] ]

options:

to-folder

**DISPLAY**

list istats-trigger

list istats-trigger [ [ [name] | [glob] | [regex] ] ... ]

**DELETE**

delete istats-trigger [name]

**DESCRIPTION**

You can create an istats-trigger to automatically generate a Control Plane iRules event under the conditions specified in the properties.

**EXAMPLES**

mv istats-trigger /Common/my\_istats\_trigger to-folder /Common/my\_folder

Moves an istats-trigger named my\_istats\_trigger to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

**OPTIONS**

description

A user defined description of the item.

duration

Duration in seconds. The value "0" means trigger instantly when in range.

event-name

The name of the event that will be generated.

istats-key

Specify the items and thresholds to define when this istats-trigger will generate an event.

range-max

Trigger event only if value is less-than-or-equal to range-max.

range-min

Trigger event only if value is greater-than-or-equal to range-min.

Note that if 0 is included in the specified range, then the iStats key must be explicitly initialized with "istats set [key] 0" in order for the trigger to fire.

#### repeat

Repeat interval in seconds. The value "none" means do not resend the event unless the value falls outside the range and then re-enters it.

#### to-folder

An istats-trigger can be moved to any folder under /Common, but configuration dependencies may restrict it from moving out of /Common.

#### SEE ALSO

create, delete, edit, list, modify, mv, show, sys icall event, sys icall event-handler, sys icall script, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2016-03-14 sys icall istats-trigger(1)

---

## sys icall publisher

#### NAME

**publisher** - Show the services publishing events on a BIG-IP(r) system

#### MODULE

sys icall

#### SYNTAX

Show the available publishers within the sys icall module using the syntax shown in the following sections.

#### DISPLAY

```
show publisher [ field-fmt ]
show publisher [ [ [name] | [glob] | [regex] ] ... ] [ field-fmt ]
```

#### DESCRIPTION

This command lets you display the publishers on the system, as well as the events that they publish and the contexts that those events are guaranteed to contain.

By default these are shown in a tabular form; use the field-fmt option to show them in a format similar to listing other objects in tmsh.

If a published event includes no contexts, then a single line will be shown with a - in the context column. If a publisher publishes no events, then a single line will be shown with a - in the event column.

#### OPTIONS

field-fmt

By default, the events will be shown in a tabular format. This overrides the command to print the publishers in object format like the list command does for other objects.

#### SEE ALSO

show, tmsh, sys icall event, sys icall handler periodic, sys icall handler perpetual, sys icall handler triggered, sys icall istats-trigger, sys icall script

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

---

## sys icall script

**NAME**  
script - Manage a Tcl script used by handlers during execution on the BIG-IP(r) system.

**MODULE**  
sys icall

**SYNTAX**  
Manage the script component within the sys icall module using the syntax shown in the following sections.

```
CREATE/MODIFY/EDIT
create script [name]
modify script [name]
edit script [name]
options:
definition
description [string]
events [add | delete | modify | replace-all-with] {
[event name] {
contexts [add | delete | modify | replace-all-with] {
[context name]
}
}
}
```

```
mv script [ [ [source-name] [destination-name] ] |
[ [name] to-folder [folder-name] ] |
[ [name...name] to-folder [folder-name] ] ]
options:
to-folder
```

```
DISPLAY
list script
list script [name]
```

```
DELETE
delete script [name]
```

Note: You must remove all references to the icall script before deletion.

**DESCRIPTION**  
You can use this script component to manage Tcl scripts which are used by event handlers upon execution.

Caution: if you add a handler to a shared configuration on a set of BIG-IP appliances, then care must be used in making changes to configuration items. A handler's script which makes config changes on more than one device may cause inconsistencies that must be manually resolved.

**EXAMPLES**  
create script my\_script1

Create a new icall script item called "my\_script1". Upon pressing enter, the user will enter the text editor in order to edit the Tcl script. Note that this configuration item may only be modified while in the edit view.

```
mv script /Common/my_script to-folder /Common/my_folder
```

Moves an icall script named my\_script to a folder named my\_folder, where my\_folder has already been created and exists within /Common.

**OPTIONS**  
definition  
Holds the Tcl code.  
description  
User defined description.

events  
Register events with the system that this script creates.

to-folder  
An icall script can be moved to any folder under /Common, but configuration dependencies may restrict it from moving out of /Common.

**EVENT ACCESSORS**  
In addition to all the tmsh:: commands provided by the system to use in the Tcl scripts (please see help cli script), the commands below are provided to access event specific information.

Hint: When you use a tmsh:: command, call it inside of Tcl catch to receive any error messages returned, and to allow the script to exit gracefully if needed. Without Tcl catch, the script may crash and end the process.

The following Tcl variables may be used in triggered handlers. (The \$ is not part of the variable name but is the lookup operator for the Tcl variable.):

```
$EVENT::context([name])
```

An array variable containing the value of each context, keyed by the context name.

`$EVENT::creation_time`

The date and time the event was generated.

`$EVENT::event_name`

The name of the event that was generated.

`$EVENT::handler_name`

The name of the event handler that matched the event being handled.

`$EVENT::script_name`

The name of the currently running script.

For use in perpetual handlers:

`EVENT::get_next [ -timeout [milliseconds] ]`

The timeout parameter is optional. If the timeout is set, then `EVENT::get_next` will return 0 if no event matches before the timeout hits. Otherwise, the `EVENT::get_next` will return 1, and the above variables in the `EVENT::` namespace will be replaced with the data from the new event.

#### SCRIPT EXAMPLES

The following script will print out all the information of an event.

```
puts "*** start of event ***"

foreach var [info vars EVENT::*] {
  set varname [namespace tail $var]
  if { [array exists $var] } {
    puts "$varname: "
    foreach { k v } [array get $var] { ;#k = key v = value
      puts "$k:$v"
    }
  } else {
    puts "$varname: [set $var]"
  }
}
```

The next script will allow events to hold bash commands and have the script execute them. The script would be required to run inside an event handler that subscribed to the appropriate event and filtered on the words "utility" and "arguments".

```
set bash_cmd $EVENT::context(utility) append bash_cmd " "
$EVENT::context(arguments)
```

```
if { [catch { exec /bin/bash -c $bash_cmd } result] } {
  puts "error executing bash command: $bash_cmd" } else {
  puts $result }
```

## sys icmp-stat

**NAME**  
icmp-stat - Displays and resets ICMP statistics on the BIG-IP system.

**MODULE**  
sys

**SYNTAX**  
Configure the icmp-stat component within the sys module using the syntax in the following section.

**MODIFY**  
reset-stats icmp-stat

**DISPLAY**  
show icmp-stat  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**

You can use the `icmp-stat` component to display and reset ICMP statistics. The statistics you can view are standard ICMP statistics, including ICMPv4 packets and errors, and ICMPv6 packets and errors.

#### OPTIONS

For information about the options that you can use with the command `show`, see `help show`.

For information about the options that you can use with the command `reset-stats`, see `help reset-stats`.

#### SEE ALSO

`reset-stats`, `show`, `sys icmp-stat`, `tmsh`

#### COPYRIGHT

BIG-IP 2011-04-25 sys icmp-stat(1)

---

## sys icontrol-soap

#### NAME

`icontrol-soap` - Configures the iControl SOAP daemon for the BIG-IP(r) system.

#### MODULE

`sys`

#### SYNTAX

Configure the `icontrol-soap` component within the `sys` module using the following syntax.

##### CREATE/MODIFY

```
modify icontrol-soap
options:
  allow [add | delete | none | replace-all-with] {
    All or IP address ...
  }
```

```
edit icontrol-soap
options:
  all-properties
  non-default-properties
```

##### DISPLAY

```
list icontrol-soap
list icontrol-soap [option name]
show running-config icontrol-soap
show running-config icontrol-soap [option name]
options:
  all-properties
  non-default-properties
  one-line
```

#### DESCRIPTION

You can use the `icontrol-soap` component to configure the iControl SOAP for the system.

Important: F5 Networks recommends that users of the Configuration utility exit the utility before changes are made to the system using the `icontrol-soap` component. This is because making changes to the system using this component causes a restart of the `icontrol-soap` daemon. Additionally, restarting the `icontrol-soap` daemon creates the necessity for a restart of the Configuration utility.

#### EXAMPLES

```
modify icontrol-soap allow replace-all-with {9.9.9.9}
```

Reduces the allowed IP address that can access iControl SOAP to 9.9.9.9

#### OPTIONS

`allow`  
Configures IP addresses for iControl SOAP clients from which the `icontrol-soap` daemon accepts requests. The value may be either a full IP address or a Perl Compatible Regular Expression to allow connections from a specific subnet. The default value is `All`.

Warning: Using the value `none` resets the `icontrol-soap` daemon to allow all iControl SOAP clients access to the system; therefore, F5 Networks recommends that you do not use the value `none`.

#### SEE ALSO

`edit`, `list`, `modify`, `show`, `tmsh`

## sys ip-address

### NAME

ip-address - Displays the IP addresses currently associated with a configuration object on a BIG-IP(r) system.

### MODULE

sys

### SYNTAX

Display the IP addresses associated with a BIG-IP system configuration object using the syntax in the following section.

#### DISPLAY

show ip-address

#### options:

[all-properties | field-fmt]

### DESCRIPTION

You can use the ip-address component to display the location on the BIG-IP system of the IP addresses associated with a configuration object. The system displays the following information:

#### Entry

Displays the IP address and any associated configuration. For example, for a Local Traffic Manager pool member, the entry is the member's IP address and port number, 10.1.1.1:80.

#### Component

Displays the type of component associated with the IP address. For example, for a Local Traffic Manager pool, the entry is ltm pool.

#### Object-ID

Displays the name of a configuration object associated with the IP address. For example, for a Local Traffic Manager pool named my\_pool, the entry is my\_pool.

#### Property

When you specify the all-properties option, displays the name of the property that contains the IP address value. Note that if the IP address is an object identifier the system displays n/a.

### EXAMPLES

show ip-address

Displays the IP addresses currently associated with a BIG-IP system configuration object.

### OPTIONS

For information about the options that you can use with the command show, see help show.

### SEE ALSO

show, tmsh

## COPYRIGHT

## sys ip-stat

**NAME**  
ip-stat - Displays and resets IP statistics on the BIG-IP system.

**MODULE**  
sys

**SYNTAX**  
Configure the ip-stat component within the sys module using the syntax in the following section.

**MODIFY**  
reset-stats ip-stat

**DISPLAY**  
show ip-stat  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the ip-stat component to display and reset IP statistics. The statistics you can view are standard IP statistics, including IPv4 and IPv6 packets, fragments, fragments reassembled, and errors.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.  
  
For information about the options that you can use with the command reset-stats, see help reset-stats.

**SEE ALSO**  
reset-stats, show, sys ip-stat, tmsh

**COPYRIGHT**

## sys ipfix destination

**NAME**  
destination - Displays or resets statistics for IPFIX log destinations.

**MODULE**  
sys ipfix

**SYNTAX**  
Specify the destination within the sys ipfix module using the syntax in the following section.

**MODIFY**  
reset-stats destination [name]

**DISPLAY**  
show destination [name]

**DESCRIPTION**  
You can use the destination component to display IPFIX destination statistics, like Templates and Data Record counts. You can also reset the IPFIX destination statistics to zero at any time.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.  
  
For information about the options that you can use with the command reset-stats, see help reset-stats.

**SEE ALSO**  
reset-stats, show, sys log-config destination ipfix, sys ipfix irules, sys ipfix element, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.  
  
F5 Networks and BIG-IP (c) Copyright 2014. All rights reserved.

## sys ipfix element

**NAME**  
element - Configures element for IPFIX logging.

**MODULE**  
sys ipfix

**SYNTAX**  
Configure the IPFIX component within the sys ipfix module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create element [name]  
modify element [name]  
options:  
all  
app-service [[string] | none]  
data-type  
[ boolean | datetime-microseconds |  
datetime-milliseconds | datetime-nanoseconds |  
datetime-seconds | float32 | float64 |  
ipv4-address | ipv6-address | macaddress |  
octetarray | signed16 | signed32 | signed64 |  
signed8 | string |  
unsigned16 | unsigned32 |  
unsigned64 | unsigned8 ]  
description [string]  
enterprise-id [integer]  
id [integer]  
size [integer]

**DISPLAY**  
list element  
list element [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line

**DELETE**  
delete element [name]

Note: Default elements loaded at boot time may not be deleted.

**DESCRIPTION**  
You can use the element component to configure elements for the IPFIX logging interface.

**EXAMPLES**  
create element myelement id 345 enterprise-id 543 data-type string size 128  
  
Creates a element named myelement with element id 345, enterprise-id 543, data-type string and data size of 128.  
  
delete element myelement  
  
Deletes the element named myelement.  
  
list element myelement  
  
Displays properties of the element named myelement.

**OPTIONS**  
all Specifies that you want to modify all of the existing components of the specified type.

app-service  
Specifies the name of the application service to which the element belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the element. Only the application service can modify or delete the element.

data-type  
Specifies the data type of the element.

description  
User defined description.

enterprise-id  
Specifies the enterprise-id for the IPFIX element being configured between 0 and 4294967295. An enterprise id value of 0 is used to define standardized IANA Information Elements.

id  
Specifies the element id for the IPFIX element being configured between 1 and 65535. Values greater than 32767 will be considered NETFLOW-only Information Elements; since the high bit of the 16-bit value is set for those values.

size Specifies the IPFIX element data size between 1 and 1900 for data-types octetarray and string. The default is 0; and means variable for these two data-types.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique alphanumeric name for the component. Preferably camel casing. This option is required for the commands create, delete, and modify.

regex Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**

create, delete, glob, list, modify, regex, tmsh

**COPYRIGHT**

## sys ipfix irules

**NAME**

irules - Displays or resets statistics for irules that use IPFIX logging destinations.

**MODULE**

sys ipfix

**SYNTAX**

Specify the irules component within the sys ipfix module using the syntax in the following section.

**MODIFY**

reset-stats irules

**DISPLAY**

show irules

**DESCRIPTION**

You can use the irules component to display a global set of statistics for the iRules that use IPFIX destinations, like memory allocation and outstanding counts for templates, messages and destinations. You can also reset the IPFIX iRules statistics to zero at any time.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

For information about the options that you can use with the command reset-stats, see help reset-stats.

**SEE ALSO**

reset-stats, show, sys log-config destination ipfix, sys ipfix destination, sys ipfix element, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2014-05-27 sys ipfix irules(1)

---

## sys iprep-status

**NAME**  
 iprep-status - Displays the status of an IP reputation database. In the BIG-IP(R) Configuration Utility, this database is referred to as the IP Address Intelligence database.

**MODULE**  
 sys

**SYNTAX**  
 Display information about the iprep-status component within the sys module using the following syntax.

**DISPLAY**  
 show iprep-status  
 options:  
 current-module  
 field-fmt  
 running-config

**DESCRIPTION**  
 You can use the iprep-status component to display status information about the IP reputation database. The reputation database (referred to as IP Address Intelligence in the Config Utility) is available from third-party vendors. An IP intelligence database is a list of IP addresses that have a questionable reputation. The status information returned includes:

- the date and time that the BIG-IP system last contacted the vendor server
- the date and time that the BIG-IP system last received an update
- the total number of IP address in the database
- the number of IP addresses in the most recent update

Note: When the system has an IP Intelligence license and the database variable db iprep.autoupdate is enabled (default), the database is automatically downloaded and stored in the binary file:

/var/IpRep/F5IpRep.dat

The database contains information that maps IP addresses or ranges of IP addresses to one or more reputation categories. After every update, the IpRep data file is loaded from disk into the running configuration.

**EXAMPLES**  
 show iprep-status

Displays current status information for the IP reputation database.

**OPTIONS**  
 For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
 show, tmsh

**COPYRIGHT**

## sys license

**NAME**  
 license - Manage the BIG-IP(r) system licensing information.

**MODULE**  
 sys

**SYNTAX**  
 Manage the license component within the sys module using the syntax in the following section.

**INSTALL**  
 install license  
 options:  
 add-on-keys { [key] ...}  
 license-server [ [host name] | [IP address] ]  
 license-server-port [number]  
 no-certificate-update  
 registration-key [key]  
 show-difference  
 verbose

**DISPLAY**  
show license  
options:  
detail

**DESCRIPTION**

You can use the license component to do the following:

Display detailed licensing and version information for the system, including the registration key, licensing dates, platform ID, suggested service check date, and the installed active modules.

Install and update the system license.

**EXAMPLES**

show license

Displays the system software licensing information.

show license detail

Displays the system software licensing information, including optional modules and active features.

install license

Reactivate an existing license.

**OPTIONS**

add-on-keys

Specifies additional feature modules to be included in the license. If add-on keys are not specified the system will use the add-on keys in the current license file.

license-server

Specifies the host name or IP address of the license server. The default value is 65.61.115.202 (activate.f5.com).

license-server-port

Specifies the IP port of the license server. The default value is 443.

no-certificate-update

Do not perform the certificate update check when contacting the Licensing Server.

registration-key

Specifies the license registration key. If the registration key is not specified the system will use the registration key in the current license file.

show-difference

Displays a comparison between the existing license and the pending license, and prompts to allow the user to keep the existing license or install the pending license.

verbose

Display status as the license is being installed.

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

show, tmsh

## sys log-config destination alertd

**NAME**

alertd - Modify the AlertD destination.

**MODULE**

sys log-config destination

**SYNTAX**

Modify the AlertD component within the sys log-config destination module using the syntax shown in the following sections.

**MODIFY**

modify alertd [name]  
options:

```
all
description [string]

DISPLAY
list alertd
list alertd [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line

Note: There is only one AlertD destination, alertd; this destination
cannot be created or deleted.

DESCRIPTION
You can use this destination component to modify the AlertD destination
for the common logging interface. There is only one AlertD destination;
it cannot be deleted. You can use this destination to send logs
directly to the AlertD daemon, bypassing syslog-ng.

EXAMPLES
list alertd alertd

Displays properties of the AlertD destination.

OPTIONS
all Specifies that you want to modify all of the existing components
of the specified type.

description
User defined description.

glob Displays the items that match the glob expression. See help glob
for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required
for the modify command.

regex
Displays the items that match the regular expression. The regular
expression must be preceded by an at sign (@[regular expression])
to indicate that the identifier is a regular expression. See help
regex for a description of regular expression syntax.

SEE ALSO
glob, list, modify, regex, tmsb

COPYRIGHT
No part of this program may be reproduced or transmitted in any form or
by any means, electronic or mechanical, including photocopying,
recording, or information storage and retrieval systems, for any
purpose other than the purchaser's personal use, without the express
written permission of F5 Networks, Inc.

```

---

## sys log-config destination arcsight

```
NAME
arcsight - Formats incoming logs into the ArcSight format for delivery
by a forwarding destination.

MODULE
sys log-config destination

SYNTAX
Configure the ArcSight component within the sys log-config destination
module using the syntax shown in the following sections.

CREATE/MODIFY
create arcsight [name]
modify arcsight [name]
options:
  all
  app-service [[string] | none]
  description [string]
  forward-to [string]

DISPLAY
list arcsight
list arcsight [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line

DELETE
delete arcsight [name]
```

Note: You must remove all references to a destination before you can delete the destination. Default destinations may not be deleted.

#### DESCRIPTION

You can use this destination component to create ArcSight formatting destinations for the common logging interface. ArcSight log destinations currently only deliver log messages from the Network Firewall Module or the Application Security Module.

#### EXAMPLES

```
create arcsight my_dest forward-to another_dest
```

Creates an ArcSight destination named `my_dest` which forwards to another destination `another_dest`. `another_dest` must be a Local Syslog, Local Database, Remote Syslog, or Remote High Speed Log destination.

```
delete arcsight my_dest
```

Deletes the destination named `my_dest`. Destinations cannot be deleted when in use by a publisher.

```
list arcsight my_dest
```

Displays properties of the destination named `my_dest`.

#### OPTIONS

`all` Specifies that you want to modify all of the existing components of the specified type.

##### `app-service`

Specifies the name of the application service to which the destination belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the destination. Only the application service can modify or delete the destination.

##### `description`

User defined description.

##### `forward-to`

Specifies a Local Syslog, Local Database, Remote Syslog, or Remote High Speed Log destination. This is required for the create and modify commands.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

##### `regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

#### SEE ALSO

`create`, `delete`, `glob`, `list`, `modify`, `regex`, `tmsh`

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2008, 2012-2013. All rights reserved.

---

## sys log-config destination ipfix

#### NAME

`ipfix` - Formats log messages into IPFIX messages and sends them to a specified pool of IPFIX Collectors

#### MODULE

`sys log-config destination`

#### SYNTAX

##### CREATE/MODIFY

```
create ipfix [name]
```

```
modify ipfix [name]
```

##### options:

```
all
```

```
app-service    [[string] | none]
```

```
description    [string]
```

```
pool-name      [string]
```

```
protocol-version [ipfix | netflow-9]
```

```
template-delete-delay [integer]
template-retransmit-interval [integer]
transport-profile [profile name]
serverssl-profile [profile name]
```

#### DISPLAY

```
list ipfix
list ipfix [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

#### DELETE

```
delete ipfix [name]
```

Note: You must remove all references to a destination before you can delete the destination. Default destinations may not be deleted.

#### DESCRIPTION

You can use this destination component to create IPFIX forwarding destinations for the common logging interface.

The IPFIX protocol is designed for logging IP-transmission events. RFC 5101 () specifies the protocol, and RFC 5102 () describes the information model for IPFIX logs. IPFIX logs are raw, binary-encoded strings with their fields and field lengths defined by IPFIX templates. IPFIX collectors are external devices that can receive IPFIX templates and use them to interpret IPFIX logs.

#### EXAMPLES

```
create ipfix my_dest pool-name my_pool
```

Creates a destination named my\_dest which sends IPFIX messages to the pool named my\_pool.

```
delete ipfix my_dest
```

Deletes the destination named my\_dest. Destinations cannot be deleted when in use by a publisher or another destination.

```
list ipfix my_dest
```

Displays properties of the destination named my\_dest.

#### OPTIONS

all Specifies that you want to modify all of the existing components of the specified type.

##### app-service

Specifies the name of the application service to which the destination belongs. The default value is none.

Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the destination. Only the application service can modify or delete the destination.

##### description

A user defined description for this logging destination.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

##### pool-name

Specifies the LTM pool that receives messages from the IPFIX destination. This option is required for the create command. The pool should contain one or more IPFIX collectors; use the "ltm pool" component to set up an LTM pool.

##### protocol-version

Specifies the protocol version used to encode IPFIX messages sent by this logging destination. The possible values are ipfix and netflow-9. The default is ipfix.

##### template-delete-delay

This feature is not implemented.

##### template-retransmit-interval

Specifies the time interval, in seconds, after which this IPFIX logging destination must resend all active IPFIX Templates to the pool of IPFIX collectors.

The logging destination periodically retransmits all of its IPFIX templates at the interval you set in this property. These retransmissions can be helpful if the transport-profile is UDP, a lossy transport mechanism. They can also be useful for debugging a network session with a network analyzer, such as Wireshark.

The default value is 30 seconds.

##### transport-profile

Specifies the name of a profile for the transport protocol to be used by this IPFIX logging destination. You can use any existing TCP-based or UDP-based profile. The default value is the default udp profile.

You can use the ltm profile tcp command (see "ltm profile tcp") to create a TCP profile, or ltm profile udp (see "ltm profile udp") to create a UDP profile.

#### serverssl-profile

Specifies the name of a server-side SSL profile to be used by this IPFIX Log Destination. The default is not to use a server-side SSL profile. If one is specified, the IPFIX Log Destination must be configured to use TCP as the transport protocol, and will use SSL over TCP to communicate with the configured IPFIX collectors.

You can use the ltm profile server-ssl command (see "ltm profile server-ssl") to create a server-side SSL profile.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### SEE ALSO

ltm pool, ltm profile tcp, ltm profile udp, create, delete, glob, list, modify, regex, tmsh

#### COPYRIGHT

## sys log-config destination local-database

#### NAME

local-database - Modify the Local Database destination.

#### MODULE

sys log-config destination

#### SYNTAX

Modify the Local Database component within the sys log-config destination module using the syntax shown in the following sections.

##### MODIFY

modify local-database [name]

options:

all  
description [string]

##### DISPLAY

list local-database

list local-database [ [ [name] | [glob] | [regex] ] ... ]

options:

all-properties  
non-default-properties  
one-line

Note: There is only one Local Database destination, local-db. This destination cannot be created or deleted.

#### DESCRIPTION

You can use this destination component to modify the Local Database destination for the common logging interface. There is only one Local Database destination that cannot be deleted.

#### EXAMPLES

list local-database local-db

Displays properties of the Local Database destination.

#### OPTIONS

all Specifies that you want to modify all of the existing components of the specified type.

description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the modify command.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO  
glob, list, modify, regex, tmsb

## sys log-config destination local-syslog

NAME  
local-syslog - Configures the Local Syslog destination.

MODULE  
sys log-config destination

SYNTAX  
Modify the Local Syslog component within the sys log-config destination module using the syntax shown in the following sections.

MODIFY  
modify local-syslog [name]  
options:  
all  
default-facility [ local0 | local1 | local2 | local3 | local4 | local5 | local6 | local7 ]  
default-severity [ alert | crit | debug | emerg | err | info | notice | warn ]  
description [string]

DISPLAY  
list local-syslog  
list local-syslog [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
one-line

Note: There is only one Local Syslog destination, local-syslog. This destination cannot be created or deleted.

DESCRIPTION  
You can use this destination component to modify the Local Syslog destination for the common logging interface. There is only one Local Syslog destination which cannot be deleted.

EXAMPLES  
list local-syslog local-syslog  
  
Displays properties of the Local Syslog destination.

OPTIONS  
all Specifies that you want to modify all of the existing components of the specified type.  
  
default-facility  
Specifies the facility given to log messages received that do not already have one. The default value is local0. The options are local0, local1, local2, local3, local4, local5, local6, and local7.  
  
default-severity  
Specifies the severity given to log messages received that do not already have one. The default value is info. The options are debug, info, notice, warn, err, crit, alert, and emerg.  
  
description  
User defined description.  
  
glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.  
  
name Specifies a unique name for the component. This option is required for the modify command.  
  
regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

SEE ALSO  
glob, list, modify, regex, tmsb

## sys log-config destination management-port

### NAME

management-port - Sends received messages to a specified IP address and port through the management interface.

### MODULE

sys log-config destination

### SYNTAX

Configure the Management Port Log component within the sys log-config destination module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
create management-port [name]
modify management-port [name]
options:
  all
  app-service [[string] | none]
  description [string]
  ip-address [ ip address ]
  port [ port ]
  protocol [ tcp | udp ]
```

#### DISPLAY

```
list management-port
list management-port [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

#### DELETE

```
delete management-port [name]
```

Note: You must remove all references to a destination before you can delete the destination. Default destinations may not be deleted.

### DESCRIPTION

You can use this destination component to create Management Port Log forwarding destinations for the common logging interface.

### EXAMPLES

```
create management-port my_dest ip-address 1.2.3.4 port 99 protocol udp
```

Creates a destination named my\_dest which forwards to the address 1.2.3.4:99 using the UDP protocol.

```
delete management-port my_dest
```

Deletes the destination named my\_dest. Destinations cannot be deleted when in use by a publisher or another destination.

```
list management-port my_dest
```

Displays properties of the destination named my\_dest.

### OPTIONS

**all** Specifies that you want to modify all of the existing components of the specified type.

#### app-service

Specifies the name of the application service to which the destination belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the destination. Only the application service can modify or delete the destination.

#### description

User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### ip-address

Specifies the IP address that will receive messages from the specified destination.

**port** Specifies the port of the IP address that will receive messages from the specified destination.

**protocol**  
Specifies the protocol used to send messages to the specified destination. The default value is tcp. The options are tcp and udp.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**

create, delete, glob, list, modify, regex, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

**BIG-IP** syslog-config destination management-port(1)

---

## sys log-config destination remote-high-speed-log

**NAME**

remote-high-speed-log - Sends received messages to a specified pool.

**MODULE**

sys log-config destination

**SYNTAX**

Configure the Remote High Speed Log component within the sys log-config destination module using the syntax shown in the following sections.

**CREATE/MODIFY**

```
create remote-high-speed-log [name]
modify remote-high-speed-log [name]
options:
  all
  app-service [[string] | none]
  description [string]
  distribution [ adaptive | balanced | replicated ]
  pool-name [ string ]
  protocol [ tcp | udp ]
```

**DISPLAY**

```
list remote-high-speed-log
list remote-high-speed-log [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

**DELETE**

```
delete remote-high-speed-log [name]
```

Note: You must remove all references to a destination before you can delete the destination. Default destinations may not be deleted.

**DESCRIPTION**

You can use this destination component to create Remote High Speed Log forwarding destinations for the common logging interface.

**EXAMPLES**

```
create remote-high-speed-log my_dest pool-name my_pool

Creates a destination named my_dest which forwards to the pool my_pool.

delete remote-high-speed-log my_dest

Deletes the destination named my_dest. Destinations cannot be deleted
when in use by a publisher or another destination.

list remote-high-speed-log my_dest

Displays properties of the destination named my_dest.
```

**OPTIONS**

**all** Specifies that you want to modify all of the existing components of the specified type.

**app-service**  
Specifies the name of the application service to which the destination belongs. The default value is none. Note: If the

strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the destination. Only the application service can modify or delete the destination.

**description**  
User defined description.

**distribution**  
Specifies the distribution method used by the Remote High Speed Log destination to send messages to pool members. The default method is adaptive: connections to pool members will be added as required to provide enough logging bandwidth. This can have the undesirable effect of logs accumulating on only one pool member when it provides sufficient logging bandwidth on its own. balanced sends each successive log to a new pool member, balancing the logs among them according to the pool's load balancing method. replicated replicates each log to all pool members, for redundancy.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**pool-name**  
Specifies the ltm pool that receives messages from the Remote High Speed Log destination. This option is required for the create command.

**protocol**  
Specifies the protocol used to send messages to the specified pool. The default value is tcp. The options are tcp and udp.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**

create, delete, glob, list, modify, regex, tmsh

**COPYRIGHT**

---

## sys log-config destination remote-syslog

**NAME**

remote-syslog - Configures Remote Syslog destinations to format log messages into Syslog format and forward them to a Remote High-Speed Log destination.

**MODULE**

sys log-config destination

**SYNTAX**

Configure the Remote Syslog component within the sys log-config destination module using the syntax shown in the following sections.

**CREATE/MODIFY**

```
create remote-syslog [name]
modify remote-syslog [name]
options:
  all
  app-service [[string] | none]
  default-facility [ local0 | local1 | local2 | local3 | local4 | local5 | local6 | local7 ]
  default-severity [ alert | crit | debug | emerg | err | info | notice | warn ]
  description [string]
  format [ legacy-bigip | rfc3164 | rfc5424 ]
  remote-high-speed-log [string]
```

**DISPLAY**

```
list remote-syslog
list remote-syslog [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

**DELETE**

```
delete remote-syslog [name]
```

Note: You must remove all references to a destination before you can delete the destination. Default destinations may not be deleted.

#### DESCRIPTION

You can use this destination component to create Remote Syslog formatting destinations for the common logging interface.

#### EXAMPLES

```
create remote-syslog my_dest remote-high-speed-log another_dest
```

Creates a destination named `my_dest` which forwards to another destination `another_dest`. `another_dest` may not be another Remote Syslog destination.

```
delete remote-syslog my_dest
```

Deletes the destination named `my_dest`. Destinations cannot be deleted when in use by a publisher or another destination.

```
list remote-syslog my_dest
```

Displays properties of the destination named `my_dest`.

#### OPTIONS

`all` Specifies that you want to modify all of the existing components of the specified type.

##### `app-service`

Specifies the name of the application service to which the destination belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the destination. Only the application service can modify or delete the destination.

##### `default-facility`

Specifies the facility given to log messages received that do not already have a facility listed. The default value is `local0`. The options are `local0`, `local1`, `local2`, `local3`, `local4`, `local5`, `local6`, and `local7`.

##### `default-severity`

Specifies the severity given to log messages received that do not already have a severity listed. The default value is `info`. The options are `debug`, `info`, `notice`, `warn`, `err`, `crit`, `alert`, and `emerg`.

##### `description`

User defined description.

##### `format`

Specifies the syslog format received messages are formatted into. The default value is `rfc3164`. The options are `legacy-bigip`, `rfc3164`, and `rfc5424`. For more information, see the respective RFCs.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

##### `regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

##### `remote-high-speed-log`

Specifies the forwarding destination to send logs in the syslog format. This option is required for the `create` command. It may only be a remote high speed log destination or a management port destination.

#### SEE ALSO

`create`, `delete`, `glob`, `list`, `modify`, `regex`, `tmsh`

#### COPYRIGHT

You can use this destination component to create Splunk formatting destinations for the common logging interface.

**EXAMPLES**  
create splunk my\_dest forward-to another\_dest

Creates a destination named my\_dest which forwards to another destination another\_dest. another\_dest must be a Local Syslog, Local Database, Remote Syslog, or Remote High Speed Log destination.

delete splunk my\_dest

Deletes the destination named my\_dest.

list splunk my\_dest

Displays properties of the destination named my\_dest. Destinations cannot be deleted when in use by a publisher.

**OPTIONS**  
all Specifies that you want to modify all of the existing components of the specified type.

app-service  
Specifies the name of the application service to which the destination belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the destination. Only the application service can modify or delete the destination.

description  
User defined description.

forward-to  
Specifies a Local Syslog, Local Database, Remote Syslog, or Remote High Speed Log destination to receive Splunk formatted log messages. This is required for the creation of a Splunk destination.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

regex  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**  
create, delete, glob, list, modify, regex, tmsh

## sys log-config filter

### NAME

filter - Configures the filter component which filters out log messages for distribution by the publisher component.

### MODULE

sys log-config

### SYNTAX

Configure the filter component within the sys log-config module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
create filter [name]
```

```
modify filter [name]
```

#### options:

all

app-service [[string] | none]

description [string]

level [ alert | crit | debug | emerg | err | info | notice | warn ]

message-id [ 8 digit hex number | none ]

publisher [[string] | none]

source [ accesscontrol | accessperrequest | adapt | alertd | all | apmac1 | arp | avr |

#### DISPLAY

```
list filter
```

```
list filter [ [ [name] | [glob] | [regex] ] ... ]
```

#### options:

all-properties

non-default-properties

one-line

#### DELETE

```
delete filter [name]
```

### DESCRIPTION

You can use the filter component to configure the filters for the common logging interface.

### EXAMPLES

```
create filter my_filter publisher my_pub
```

Creates a filter named my\_filter with the publisher my\_pub.

```
delete filter my_filter
```

Deletes the filter named my\_filter.

```
list filter my_filter
```

Displays properties of the filter named my\_filter.

### OPTIONS

all Specifies that you want to modify all of the existing components of the specified type.

#### app-service

Specifies the name of the application service to which the filter belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the filter. Only the application service can modify or delete the filter.

#### description

User defined description.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

#### level

The minimum severity level of logs to be filtered. The severity

levels in increasing order are debug, info, notice, warn, err, crit, alert, and emerg. The default value is debug.

#### message-id

A refinement for filtering out specific logs. The default value is none. This is an eight digit hex number. The proper hex value can be obtained from an existing log message by extracting the eight digit value.

For example, the message-id for the example log message below is highlighted.

```
Oct 9 15:38:20 bigip1 notice mcpd[21498]: 01070410:5: Removed
subscription with subscriber id logstatd
```

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

#### publisher

A publisher to send filtered log messages. The default value is none.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

#### source

The stream of log messages that will be filtered by the created/modified filter. The default value is all.

#### SEE ALSO

create, delete, glob, list, modify, regex, tmsh

## sys log-config publisher

#### NAME

publisher - Configures lists of destinations for the common logging interface.

#### MODULE

sys log-config

#### SYNTAX

Configure the publisher component within the sys log-config module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
create publisher [name]
modify publisher [name]
options:
  all
  app-service [[string] | none]
  description [string]
  destinations [add | delete | none | replace-all-with] {
    [ [destinations] ]
  }
}
```

#### DISPLAY

```
list publisher
list publisher [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
  one-line
```

#### DELETE

```
delete publisher [name]
```

Note: You must remove all references to a publisher before you can delete the publisher. Default publishers may not be deleted.

#### DESCRIPTION

You can use the publisher component to configure publishers for the common logging interface.

#### EXAMPLES

```
create publisher my_pub destinations add {
```

```
destination_1
destination_2
}
```

Creates a publisher named `my_pub` with two destinations, `destination_1` and `destination_2`.

```
delete publisher my_pub
```

Deletes the publisher named `my_pub`.

```
list publisher my_pub
```

Displays properties of the publisher named `my_pub`.

#### OPTIONS

`all` Specifies that you want to modify all of the existing components of the specified type.

`app-service`

Specifies the name of the application service to which the publisher belongs. The default value is none. Note: If the `strict-updates` option is enabled on the application service that owns the object, you cannot modify or delete the publisher. Only the application service can modify or delete the publisher.

`description`

User defined description.

`destinations`

Adds, deletes, or replaces a set of destinations.

`glob` Displays the items that match the glob expression. See help `glob` for a description of glob expression syntax.

`name` Specifies a unique name for the component. This option is required for the commands `create`, `delete`, and `modify`.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See help `regex` for a description of regular expression syntax.

#### SEE ALSO

`create`, `delete`, `glob`, `list`, `modify`, `regex`, `tmsh`

#### COPYRIGHT

## sys log-rotate

#### NAME

`log-rotate` - Configures log rotation for the BIG-IP(r) system.

#### MODULE

`sys`

#### SYNTAX

Configure the `log-rotate` component within the `sys` module using the syntax in the following sections.

#### MODIFY

```
modify log-rotate
```

```
options:
```

```
common-backlogs [integer]
common-include [string]
description [string]
ilx-include [string]
ilx-rotations [string]
ilx-schedule [string]
ilx-size [string]
include [string]
max-file-size [integer]
mysql-include [string]
syslog-include [string]
tomcat-include [string]
wa-include [string]
```

```
edit log-rotate
```

```
options:
```

```
all-properties
```

## non-default-properties

### DISPLAY

```
list log-rotate
list log-rotate [option]
show running-config log-rotate
show running-config log-rotate [option]
options:
  all-properties
  non-default-properties
  one-line
```

### DESCRIPTION

You can configure the system to rotate the log files after a specified length of time. This helps to clear the hard drive of unneeded log files.

### EXAMPLES

```
modify log-rotate common-backlogs 7
```

Specifies that the system saves seven copies of the common log files.

```
list log-rotate all-properties
```

Displays the configuration of the log-rotate component.

### OPTIONS

#### common-backlogs

Specifies the number of logs that you want the system to save. Select a number from the valid range of 1 - 100. The default value is 24.

#### common-include

The default value is none.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the common-include option incorrectly, you put the functionality of the system at risk.

#### description

User defined description.

#### ilx-include

The default value is none.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the include option incorrectly, you put the functionality of the system at risk.

#### ilx-rotations

The default value is 10.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the include option incorrectly, you put the functionality of the system at risk.

#### ilx-schedule

The default value is daily.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the include option incorrectly, you put the functionality of the system at risk.

#### ilx-size

The value is specified in kilobytes. The default value is 10240 kilobytes.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the include option incorrectly, you put the functionality of the system at risk.

#### include

The default value is none.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the include option incorrectly, you put the functionality of the system at risk.

#### max-file-size

The max size of rotated log files in kB. The default value is 1024000.

#### syslog-include

The default value is none.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the syslog-include option incorrectly, you put the functionality of the system at risk.

#### tomcat-include

The default value is none.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the tomcat-include option incorrectly, you put the functionality of the system at risk.

wa-include  
The default value is none.

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using this option. If you use the wa-include option incorrectly, you put the functionality of the system at risk.

## sys log

NAME  
log - Displays various system log files.

MODULE  
sys

SYNTAX  
Configure the log component within the sys module using the syntax in the following sections.

DISPLAY  
show log  
show log [audit | daemon | gtm | kernel | ltm | mail | messages |  
security | tmm | user | webui]  
options:  
lines [integer]  
range [date range]

DESCRIPTION  
You can use the log component to display various logs.

EXAMPLES  
show log  
Displays a list of logs that you can view.  
show log gtm  
Displays the Global Traffic Manager log.  
show log gtm lines 100 range 2/19/2006:15:04:00--epoch  
Displays no more than 100 lines of the Global Traffic Manager log that were logged before the 19th of February 2006 at 3:04 pm.

OPTIONS  
audit  
Displays a log of configuration changes.  
daemon  
Displays the Unix daemon logs.  
gtm  
Displays the Global Traffic Manager logs.  
kernel  
Displays Linux Kernel messages.  
lines  
Specifies how many lines of the log that you want the system to display at one time.  
ltm  
Displays Local Traffic Manager logs.  
mail  
Displays mail daemon logs.  
messages  
Displays application messages.  
range  
Specifies the date range of the log information that you want the system to display.  
security  
Displays security-related messages.  
tmm  
Displays Traffic Manager Micro-kernel logs.

user Displays various user process logs.

webui  
Displays Configuration utility logs.

SEE ALSO  
show, tmsh

**COPYRIGHT**

## sys mac-address

**NAME**  
mac-address - Displays all MAC addresses currently associated with a configuration object on a BIG-IP(r) system, including all dynamically-discovered MAC addresses.

**MODULE**  
sys

**SYNTAX**  
Display the MAC addresses associated with a BIG-IP system configuration using the syntax in the following section.

**DISPLAY**  
show mac-address  
options:  
field-fmt

**DESCRIPTION**  
You can use the mac-address component to display the location on the BIG-IP system of the MAC addresses associated with a configuration object. The system displays the following information, which identifies the location of the MAC address in the configuration.

**Entry**  
Displays the MAC address.

**Component**  
Displays the type of component associated with the MAC address, for example, net interface.

**Object-ID**  
Displays the name of a configuration object associated with the MAC address, for example, 2.1.

**Property**  
Displays the name of the property that contains the MAC address value. Note that if the MAC address is an object identifier the system displays n/a.

**EXAMPLES**  
show mac-address  
  
Displays all MAC addresses currently associated with a BIG-IP system configuration object.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

SEE ALSO  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys management-dhcp

**NAME**  
management-dhcp - Configures dhcp settings for the management interface (MGMT).

**MODULE**  
sys

**SYNTAX**  
Configure the management-dhcp component within the sys module using the syntax in the following sections.

**MODIFY**  
modify management-dhcp [name]  
options:  
client-id [string]  
description [string]  
hostname [string]  
request-options [add | delete | modify | replace-all-with]  
send-options [add | delete | modify | replace-all-with]

edit management-dhcp [name]  
options:  
all-properties

**DISPLAY**  
list management-dhcp  
list management-dhcp [name]  
show running-config sys management-dhcp  
show running-config sys management-dhcp [name]  
options:  
all-properties  
one-line

**DESCRIPTION**  
Specifies DHCP client settings for the management interface. These settings will be used to retrieve an IP address for the management interface if mgmt-dhcp is enabled.

**EXAMPLES**  
modify management-dhcp default request-options add ntp-servers  
  
Adds ntp-servers to the lists of options requested by the management interface DHCP client.

**OPTIONS**  
client-id  
Specifies the client identifier to send to the DHCP server.  
  
description  
User defined description.  
  
hostname  
Specifies the hostname to send to the DHCP server.  
  
request-options  
Specifies the options to request from the DHCP server. Adding or removing an option will be reflected at next lease renewal with dhcp server or upon restarting DHCP client.  
  
send-options  
Specifies the options to send to the DHCP server.

**SEE ALSO**  
edit, list, modify, show, sys management-ip, sys management-route, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

**BIG-IP** 2016-10-05 sys management-dhcp(1)

---

## sys management-ip

**NAME**  
management-ip - Configures the ip address and netmask for the

management interface (MGMT).

MODULE  
sys

SYNTAX  
Configure the management-ip component within the sys module using the syntax in the following sections.

**CREATE/MODIFY**

```
create management-ip [ip address/netmask]
create management-ip [ip address/prefixlen]
modify management-ip [ip address/prefixlen]
options:
  description
```

**DISPLAY**

```
list management-ip
show running-config management-ip
options:
  all-properties
  one-line
```

**DELETE**

```
delete management-ip [ip address/netmask]
delete management-ip [ip address/prefixlen]
```

**DESCRIPTION**

Specifies network settings for the management interface.

The management interface is available on all switch platforms and is designed for management purposes. You can access the browser-based Configuration utility and command line configuration utility through the management port. You cannot use the management interface in traffic management VLANs. You can configure only one IP address on the management interface.

After you make any changes using the management-ip component, issue the following command sequence to save the changes to the bigip\_base.conf file: save sys config.

To configure management-ip firewall rules, see security firewall management-ip-rules.

Note: modify only allows modification of the description field. If you wish to change the IP address of the management interface, please see the example below.

**EXAMPLES**

```
create management-ip 10.2.3.4/255.255.0.0
```

Creates the IP address 10.2.3.4 on the management interface.

```
create management-ip 10.2.3.4/16
```

Creates the IP address 10.2.3.4 on the management interface.

```
delete sys management-ip 10.2.3.4/25; create sys management-ip
10.2.3.5/25
```

Changes the IP address of the management interface. Note: modify does not allow a user to change the IP address directly.

**OPTIONS**

[ip address/netmask]  
Specifies the IPv4 address and netmask.

[ip address/prefixlen]  
Specifies the IPv6 address and prefix length.

description  
User defined description.

dhcp-enabled  
Specifies if the ip address has been configured by DHCP.

**SEE ALSO**

create, delete, list, modify, save, show, security firewall management-ip-rules, sys management-route, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2014-07-07 sys management-ip(1)

**NAME**  
 management-ovsdb - Configures the OVSDB server.

**MODULE**  
 sys

**SYNTAX**  
 Configure the management-ovsdb component within the sys module using the syntax in the following sections.

**MODIFY**  
 modify management-ovsdb  
 options:  
 ca-cert-file [filename]  
 cert-file [filename]  
 cert-key-file [filename]  
 controller-addresses [IP address(es)]  
 description [string]  
 disabled  
 enabled  
 flooding-type [multipoint | replicator]  
 log-level [level]  
 logical-routing-type [none | backhaul]  
 port [port number]  
 tunnel-floating-addresses [IP address(es)]  
 tunnel-local-address [IP address]  
 tunnel-maintenance-mode [active | passive]

**DISPLAY**  
 list management-ovsdb  
 show running-config management-ovsdb  
 options:  
 all-properties  
 one-line  
 ca-cert-file  
 cert-file  
 cert-key-file  
 controller-addresses  
 description  
 disabled  
 enabled  
 flooding-type  
 log-level  
 logical-routing-type  
 port  
 tunnel-floating-addresses  
 tunnel-local-address  
 tunnel-maintenance-mode

**DESCRIPTION**  
 Specifies the configurations for the OVSDB server.

**EXAMPLES**  
 modify management-ovsdb controller-addresses add { 10.0.0.1 }  
 Specifies 10.0.0.1 as the controller address.  
 list management-ovsdb all-properties  
 Displays the OVSDB server configurations.

**OPTIONS**  
 ca-cert-file  
 Specifies the name of the CA certificate file.  
 cert-file  
 Specifies the name of the certificate file.  
 cert-key-file  
 Specifies the name of the certificate key file.  
 controller-addresses  
 Specifies the IP address(es) of the controller.  
 disabled  
 Disables OVSDB management.  
 enabled  
 Enables OVSDB management.  
 flooding-type  
 Specifies the flooding type to use to transmit unknown destination frames.  
 log-level  
 Specifies the log level for OVSDB management. The log file is located at /var/tmp/vxland.out.  
 logical-routing-type  
 Specifies the logical routing type.  
 port  
 Specifies the OVSDB connection port. The default port is 6640.  
 tunnel-floating-addresses  
 Specifies the floating endpoint address(es) for the tunnels. The addresses need to be a self IP address associated with a floating traffic-group.  
 tunnel-local-address  
 Specifies the local endpoint address for the tunnels created by the controller. A valid IP address for the tunnel local endpoint is required when OVSDB management is enabled.

tunnel-maintenance-mode  
Specifies whether the tunnels are created automatically (active)  
or manually (passive).

description  
User defined description.

## sys management-proxy-config

NAME

management-proxy-config - Configures proxy configuration for database  
download.

MODULE

sys management-proxy-config

SYNTAX

Configure a management-proxy-config component within sys module using  
the syntax shown in the following sections.

MODIFY

The management-proxy-config consists of the object name, proxy ip  
address (proxy-ip), proxy port (proxy-port), username and password. You  
can have only one proxy configuration specified.

```
modify management-proxy-config
  proxy-ip [IpAddress]
  proxy-port [IpPort]
  username [string]
  password [string]
```

DISPLAY

```
list management-proxy-config
  options:
  all-properties
  non-default-properties
  one-line
```

DESCRIPTION

Configures proxy configuration for database download.

EXAMPLES

```
create management-proxy-config test-proxy { proxy-ip 10.10.10.10 proxy-
port 1010 username test password test}
```

Creates the proxy configuration with name test-proxy and uses the  
specified proxy-ip 10.10.10.10 and proxy-port 1010 with supplied  
credentials username/password test/test for database download.

```
modify management-proxy-config test-proxy { proxy-port 1012}
```

Modify the proxy configuration for database download to use proxy port  
1012.

OPTIONS

proxy-ip  
Specifies proxy ip to be used for database download.

proxy-port  
Specifies proxy port to be used for database download.

username  
Specifies username for proxy configuration to be used for database  
download.

password  
Specifies password for proxy configuration to be used for database  
download.

COPYRIGHT

No part of this program may be reproduced or transmitted in any form or  
by any means, electronic or mechanical, including photocopying,  
recording, or information storage and retrieval systems, for any  
purpose other than the purchaser's personal use, without the express

## sys management-route

### NAME

management-route - Configures route settings for the management interface (MGMT).

### MODULE

sys

### SYNTAX

Configure the management-route component within the sys module using the syntax in the following sections.

#### CREATE/MODIFY

create management-route [name | default | default-inet6]

##### options:

description [string]  
gateway [ip address]  
mtu [number]  
network [ip address/netmask]  
type [interface | blackhole]

modify management-route [name | default | default-inet6]

##### options:

description [string]  
gateway [ip address]  
mtu [number]  
type [interface | blackhole]

edit management-route [ [name | default | default-inet6]

| [glob] | [regex] ] ... ]

##### options:

all-properties

#### DISPLAY

list management-route

list management-route [ [name | default | default-inet6]

| [glob] | [regex] ] ... ]

show running-config management-route

show running-config management-route [ [name | default

| default-inet6] | [glob] | [regex] ] ... ]

##### options:

all-properties

one-line

#### DELETE

delete management-route [name]

### DESCRIPTION

Specifies route settings for the management interface. You must configure a route on the management interface if you want to access the management network on the BIG-IP(r) system by connecting from another network.

The management interface is available on all switch platforms and is designed for management purposes. You can access the browser-based Configuration utility and command line configuration utility through the management port. You cannot use the management interface in traffic management VLANs.

### EXAMPLES

```
create management-route default gateway 10.10.10.254
```

Sets the management interface default gateway IP address to 10.10.10.254.

```
create management-route myMgmtRoute network 10.10.10.0/24 gateway 10.10.10.254
```

Creates a management route named myMgmtRoute for the subnet 10.10.10.0/24 whose gateway IP address is 10.10.10.254.

```
modify management-route 10.10.10.0/24 gateway 172.24.74.62
```

Changes the management interface to subnet 10.10.10.0/24, and the gateway to 172.24.74.62.

### OPTIONS

#### default

Specifies that the system forwards packets to the destination through the default IP address and netmask, 0.0.0.0 0.0.0.0.

#### default-inet6

Specifies that the system forwards packets to the destination through the default version 6.0 IP address and netmask.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**[ip address/netmask]**  
Specifies the IP address and netmask through which the system forwards packets to the destination. You can use either of these formats: 0.0.0.0/0 or 0.0.0.0 0.0.0.0.

**gateway**  
Specifies that the system forwards packets to the destination through the gateway with the specified IP address.

**mtu** Specifies the maximum transmission unit (MTU) for the management interface. The value of the MTU is the largest size that the BIG-IP system allows for an IP datagram passing through the management interface.

**network**  
The subnet and netmask to be used for the route. This is an optional field; if empty the name should be of the form [ip address/netmask].

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**type** Specifies that traffic should be delivered to the management interface (interface) or be dropped by the system (blackhole).

## sys mcp-state

**NAME**  
mcp-state - Displays information about the mcpd daemon.

**MODULE**  
sys

**SYNTAX**  
Display information about the mcpd daemon using mcp-state component within the sys module using the syntax in the following section.

**DISPLAY**  
show mcp-state  
options:  
field-fmt

**DESCRIPTION**  
You can use the mcp-state component to display the current state of the mcpd daemon.

**EXAMPLES**  
show mcp-state  
  
Displays, in a table, information about the state of the mcpd daemon.  
  
show mcp-state field-fmt  
  
Displays, in field format, information about the state of the mcpd daemon.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying,

recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

---

## sys memory

**NAME**  
memory - Displays system memory information and statistics.

**MODULE**  
sys

**SYNTAX**  
Configure the memory component within the sys module using the syntax in the following sections.

**DISPLAY**  
show memory  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
global

**DESCRIPTION**  
You can use the memory component to display information about the system memory.

**EXAMPLES**  
show memory gig  
Displays memory statistics in gigabytes.  
show memory raw  
Displays raw memory statistics.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys nethsm async-queue-stat

**NAME**  
async-queue-stat - Display or reset Network HSM pkcs11d daemon async queue statistics

**MODULE**  
sys

**SYNTAX**  
Display and reset the async-queue-stat component within the sys nethsm module using the syntax in the following section.

**MODIFY**  
reset-stats async-queue-stat

**DISPLAY**  
show async-queue-stat  
options:  
(default | field-fmt)

#### DESCRIPTION

You can use the `async-queue-stat` component to display Network HSM `pkcs11d` `async-queue` statistics like `queued` operations and `queue` times. You can also reset the Network HSM `pkcs11d` `async-queue` statistics to zero at any time.

#### OPTIONS

For information about the options that you can use with the command `show`, see `help show`.

For information about the options that you can use with the command `reset-stats`, see `help reset-stats`.

#### SEE ALSO

`reset-stats`, `show`, `tmsh`

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

---

## sys nethsm pkcs11d-stat

#### NAME

`pkcs11d-stat` - Display or reset Network HSM `pkcs11d` daemon statistics

#### MODULE

`sys`

#### SYNTAX

Display and reset the `pkcs11d-stat` component within the `sys nethsm` module using the syntax in the following section.

#### MODIFY

`reset-stats pkcs11d-stat`

#### DISPLAY

`show pkcs11d-stat`

options:

(`default` | `field-fmt`)

#### DESCRIPTION

You can use the `pkcs11d-stat` component to display Network HSM `pkcs11d` statistics like `sign`, `decrypt` and `find-key` counts. You can also reset the Network HSM `pkcs11d` statistics to zero at any time.

#### OPTIONS

For information about the options that you can use with the command `show`, see `help show`.

For information about the options that you can use with the command `reset-stats`, see `help reset-stats`.

#### SEE ALSO

`reset-stats`, `show`, `tmsh`

## sys nethsm sync-queue-stat

**NAME**  
 sync-queue-stat - Display or reset Network HSM pkcs11d daemon sync queue statistics

**MODULE**  
 sys

**SYNTAX**  
 Display and reset the sync-queue-stat component within the sys nethsm module using the syntax in the following section.

**MODIFY**  
 reset-stats sync-queue-stat

**DISPLAY**  
 show sync-queue-stat  
 options:  
 (default | field-fmt)

**DESCRIPTION**  
 You can use the sync-queue-stat component to display Network HSM pkcs11d sync-queue statistics like queued operations and queue times. You can also reset the Network HSM pkcs11d sync-queue statistics to zero at any time.

**OPTIONS**  
 For information about the options that you can use with the command show, see help show.

For information about the options that you can use with the command reset-stats, see help reset-stats.

## sys ntp

**NAME**  
 ntp - Configures the Network Time Protocol (NTP) daemon for the BIG-IP(r) system.

**MODULE**  
 sys

**SYNTAX**  
 Configure the ntp component within the sys module using the following syntax.

**MODIFY**  
 modify ntp  
 options:  
 description [string]  
 include [string]  
 restrict [add | delete | replace-all-with] {  
   [string] {  
     address [IP address]  
     default-entry [enabled | disable]  
     description [string]  
     ignore [enabled | disable]  
     kod [enabled | disable]  
     limited [enabled | disable]  
     low-priority-trap [enabled | disable]  
     mask [IP address]  
     no-modify [enabled | disable]  
     non-ntp-port [enabled | disable]  
     no-peer [enabled | disable]  
     no-query [enabled | disable]  
     no-serve-packets [enabled | disable]  
     no-trap [enabled | disable]  
     no-trust [enabled | disable]  
     ntp-port [enabled | disable]  
     version [enabled | disable]  
   }  
 }  
 restrict none  
 servers [add | delete | replace-all-with] {  
   [hostname | IP address] ...  
 }

```
servers none
timezone [string]
```

```
edit ntp
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list ntp
list ntp [option]
show running-config ntp
show running-config ntp [option]
options:
  all-properties
  non-default-properties
  one-line
```

#### DESCRIPTION

You can use this component to configure the NTP servers for the system.

#### EXAMPLES

```
modify ntp servers add {192.168.1.245}
```

Adds the NTP server with the IP address, 192.168.1.245, to the system.

```
modify ntp servers replace-all-with {time.f5net.com}
```

Replaces the existing list of NTP servers with a single host, time.f5net.com.

```
modify ntp timezone "America/Los_Angeles"
```

Sets the system time to Pacific Standard Time.

```
modify ntp restrict add { basicrestrict { default-entry enable ignore
enable } }
```

Adds a default restriction denying all packets.

#### OPTIONS

```
description
User defined description.
```

#### include

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using the include option. If you use this option incorrectly, you put the functionality of the system at risk.

#### restrict

Specifies a set of access restrictions.

#### address

The address for the entry. See also, the mask option. The default value is 0.0.0.0.

#### default-entry

Specifies whether the entry is the default entry. The default value is disabled.

#### description

User defined description.

#### ignore

Specifies whether all packets will be ignored. The default value is disabled.

#### kod

Specifies whether a kod (kiss of death) packet will be sent when an access violation occurs. The default value is disabled.

#### limited

Specifies whether service will be denied if packet spacing limits are violated. The default value is disabled.

#### low-priority-trap

Specifies whether lower priority traps will be overridden by normal priority traps. The default value is disabled.

#### mask

The mask for the entry. See also, the address option. The default value is 0.0.0.0.

#### no-modify

Specifies whether ntpq and ntpdc queries that attempt to modify the server are allowed. The default value is disabled.

#### non-ntp-port

When enabled, the restrict entry will be matched only if the source port is not the standard NTP UDP port (123). The default value is disabled.

#### no-peer

Specifies whether packets will be denied if they mobilize a new association. The default value is disabled.

#### no-query

Specifies whether ntpq and ntpdc queries will be denied. The default value is disabled.

#### no-serve-packets

Specifies whether all queries except ntpq and ntpdc will be denied. The default value is disabled.

**no-trap**  
Specifies whether to decline the mode 6 control message trap service to matching hosts. The default value is disabled.

**no-trust**  
Specifies whether to reject packets that are not cryptographically authenticated. The default value is disabled.

**ntp-port**  
When enabled, the restrict entry will be matched only if the source port is the standard NTP UDP port (123). The default value is disabled.

**version**  
Specifies whether packets will be rejected if they do not match the local NTP version. The default values is disabled.

**servers**  
Configures NTP servers for the BIG-IP system.

**timezone**  
Specifies the time zone that you want to use for the system time.

**SEE ALSO**

edit, list, modify, show, tmsh

## sys outbound-smtp

**NAME**  
outbound-smtp - Configures outgoing email for the BIG-IP(x) system.

**MODULE**  
sys

**SYNTAX**  
Configure the outbound-smtp component within the sys module using the following syntax.

**MODIFY**  
modify outbound-smtp  
options:  
description [string]  
from-line-override [string]  
mailhub [string]  
rewrite-domain [string]

edit outbound-smtp  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list outbound-smtp  
list outbound-smtp [option]  
show running-config outbound-smtp  
show running-config outbound-smtp [option]  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
You can use this component to configure the outgoing SMTP server that the system will use to send automated email.

**EXAMPLES**  
modify outbound-smtp mailhub smtp.yoursite.com:587

Configures the TMOS system to send outgoing email through the specified SMTP server.

**OPTIONS**  
description  
User defined description.

from-line-override  
Specify whether From field's domain can be overridden.

mailhub

The SMTP server to use to send outgoing automated email.

rewrite-domain  
The domain name in the From address to use when sending outgoing automated email.

## sys performance all-stats

**NAME**

all-stats - Resets or displays all performance statistics.

**MODULE**

sys performance

**SYNTAX**

Reset or display all performance statistics for the system within the sys\_performance module using the syntax in the following sections. On VIPRION(r) systems, displaying performance statistics on a secondary blade is not supported.

**MODIFY**

reset-stats all-stats

**DISPLAY**

show all-stats

**options:**

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
(detail | historical)

**DESCRIPTION**

You can use the all-stats component to reset or display all system performance statistics.

Note that tmsh only displays performance statistics when you explicitly request them.

**EXAMPLES**

show all-stats detail

Displays detailed information about system performance in the system default units.

reset-stats all-stats

Resets all performance statistics for the system.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

For information about the options that you can use with the command reset-stats, see help reset-stats.

**SEE ALSO**

reset-stats, show, sys performance connections, sys performance gtm, sys performance ramcache, sys performance system, sys performance throughput, tmsh

**COPYRIGHT**

## sys performance connections

**NAME**  
connections - Displays connection performance information.

**MODULE**  
sys performance

**SYNTAX**  
Display statistics for the connections component within the sys performance module using the syntax in the following section. On VIPRION(r) systems, displaying performance statistics on a secondary blade is not supported.

**DISPLAY**  
show connections  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
(detail | historical)

**DESCRIPTION**  
You can use the connections component to display information about system performance, including details about new and active connections and HTTP requests.  
  
You can reset the connection performance statistics using the all-stats component.

**EXAMPLES**  
show connections gig detail  
  
Displays detailed information about connection performance in gigabytes.  
  
show connections historical  
  
Displays historical performance information about connections.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, sys performance all-stats, sys performance gtm, sys performance ramcache, sys performance system, sys performance throughput, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys performance dnsexpress

**NAME**  
dnsexpress - Displays performance information for the DNS-Express.

**MODULE**  
sys performance

**SYNTAX**  
Display statistics for the dnsexpress component within the sys performance module using the syntax in the following section. On VIPRION(r) systems, displaying performance statistics on a secondary blade is not supported.

**DISPLAY**  
show dnsexpress  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
(historical)

**DESCRIPTION**  
You can use the dnsexpress component to display information about system performance, including the number of queries, responses, zone transfer messages, and NOTIFYs.

**EXAMPLES**  
show dnsexpress historical

Displays historical performance information for DNS-Express.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

show, sys performance all-stats, sys performance connections, sys performance ramcache, sys performance system, sys performance throughput, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys performance dnssec

**NAME**

dnssec - Displays performance information for the DNSSEC signing.

**MODULE**

sys performance

**SYNTAX**

Display statistics for the dnssec component within the sys performance module using the syntax in the following section. On VIPRION(r) systems, displaying performance statistics on a secondary blade is not supported.

**DISPLAY**

show dnssec

**options:**

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
(historical)

**DESCRIPTION**

You can use the dnssec component to display information about system performance, including the number of queries for specific DNSSEC types and zone transfer signing.

**EXAMPLES**

show dnssec historical

Displays historical performance information for DNSSEC signing.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

show, sys performance all-stats, sys performance connections, sys performance ramcache, sys performance system, sys performance throughput, tmsh

**COPYRIGHT**

BIG-IP 2014-10-22 sys performance dnssec(1)

---

## sys performance gtm

**NAME**

gtm - Displays performance information for the Global Traffic Manager.

**MODULE**  
sys performance

**SYNTAX**  
Display statistics for the gtm component within the sys performance module using the syntax in the following section. On VIPRION(r) systems, displaying performance statistics on a secondary blade is not supported.

**DISPLAY**  
show gtm  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
(detail | historical)

**DESCRIPTION**  
You can use the gtm component to display information about system performance, including details about the Global Traffic Manager, including number of requests, resolutions, persisted connections, and those returned to DNS.

You can reset the Global Traffic Manager performance statistics using the all-stats component.

**EXAMPLES**  
show gtm detail  
Displays detailed performance information about the Global Traffic Manager in the system default units.

show gtm historical  
Displays historical performance information about the Global Traffic Manager.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, sys performance all-stats, sys performance connections, sys performance ramcache, sys performance system, sys performance throughput, tms

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

---

## sys performance ramcache

**NAME**  
ramcache - Displays RAM cache performance information.

**MODULE**  
sys performance

**SYNTAX**  
Display statistics for the ramcache component within the sys performance module using the syntax in the following section. On VIPRION(r) systems, displaying performance statistics on a secondary blade is not supported.

**DISPLAY**  
show ramcache  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
historical

**DESCRIPTION**  
You can use the ramcache component to display RAM cache utilization information.

You can reset the RAM cache performance statistics using the all-stats component.

**EXAMPLES**  
show ramcache default  
Displays ramcache performance information in the system default units.

show ramcache historical  
Displays historical ramcache performance information.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, sys performance all-stats, sys performance connections, sys performance gtm, sys performance system, sys performance throughput, tmsh

## sys performance system

#### NAME

system - Displays system performance information.

#### MODULE

sys performance

#### SYNTAX

Display statistics for the system component within the sys performance module using the syntax in the following section. On VIPRION(r) systems, displaying performance statistics on a secondary blade is not supported.

#### DISPLAY

show system

#### options:

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
(detail | historical)

#### DESCRIPTION

You can use the system component to display CPU and memory usage information.

You can reset the system performance statistics using the all-stats component.

#### EXAMPLES

show system detail

Displays detailed system performance information in the system default units.

show system historical

Displays historical system performance information.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

#### SEE ALSO

show, sys performance all-stats, sys performance connections, sys performance gtm, sys performance ramcache, sys performance throughput, tmsh

#### COPYRIGHT

BIG-IP 2012-03-26 sys performance system(1)

---

## sys performance throughput

**NAME** throughput - Displays performance information about traffic throughput.

**MODULE** sys performance

**SYNTAX** Display statistics for the throughput component within the sys performance module using the syntax in the following section. On VIPRION(r) systems, displaying performance statistics on a secondary blade is not supported.

**DISPLAY**  
show throughput  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
(detail | historical)

**DESCRIPTION**  
You can use the throughput component to display information about traffic throughput, including client, server, compression, and SSL transactions.

You can reset the throughput performance statistics using the all-stats component.

**EXAMPLES**  
show throughput gig detail  
Displays detailed throughput performance information in gigabits per second.

show throughput historical  
Displays historical throughput performance information.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, sys performance all-stats, sys performance connections, sys performance gtm, sys performance ramcache, sys performance system, tmsh

## sys pfman consumer

**NAME** consumer - Manage the state of pfman health status consumers.

**MODULE** sys pfman

**SYNTAX** Manage pfman administered consumers using the syntax in the following section.

**MODIFY**  
modify consumer [guest-name]  
parameter:  
state [up|down|reset]

**DISPLAY**  
list consumer  
list consumer [guest-name]

**DESCRIPTION**  
You can use the consumer component to manage the state of guest access to device health status services.

**EXAMPLES**  
modify consumer tesseract-guest down  
Transitions to 'down' the communication link between the hypervisor and guest pfmand daemons. When 'down', the guest is unable to send requests to the hypervisor, nor will it receive status updates.

modify consumer tesseract-guest up

Transitions to 'up' the communication link between the hypervisor and guest pfmand daemons. When 'up', the guest can send requests to the hypervisor, and receive status updates.

modify consumer tesseract-guest reset

Transitions to 'down', then to 'up', the communication link between the hypervisor and guest pfmand daemons.

list consumer tesseract-guest

Lists the current status of the guest called "tesseract-guest".

list consumer

Lists the current status of all guests.

SEE ALSO

list, modify, tmsh

COPYRIGHT

## sys pfman device

NAME

device - Manage the state of a pfman controlled device status.

MODULE

sys pfman

SYNTAX

Manage pfman administered devices using the syntax in the following section.

MODIFY

```
modify device [pci_device]
parameter:
state [up|down|reset]
```

DISPLAY

```
list device
list device [pci_device]
```

DESCRIPTION

You can use the device component to manage the state of device reset and health status reporting.

EXAMPLES

```
modify device 04:00.0 down
```

This will cause pfmand to "down" the device. A device in the "down" state will not return to use until the device returns to "up" status. All associated tmm instances will be informed of the device status change to "down".

```
modify device 86.00.0 up
```

This causes pfmand to attempt to bring a "down" device back to the "up" status. When successful, all associated tmm instances will be informed of the device status change to "up".

```
modify device 86:00.0 reset
```

Instructs pfmand to issue a reset of device 86:00.0.

```
list device 85:00.0
```

Lists the status of device 85:00.0.

```
list device
```

Lists the status of all devices.

SEE ALSO

list, modify, tmsh

COPYRIGHT

## sys proc-info

**NAME**  
proc-info - Display CPU and memory usage for each process.

**MODULE**  
sys

**SYNTAX**  
Display proc-info component within the sys module using the syntax in the following section.

**DISPLAY**  
show proc-info  
show proc-info process\_name  
options:  
(default | field-fmt | all | kil | meg | gig | raw | exa | peta | tera | zetta | yotta)

**DESCRIPTION**  
Show proc-info displays CPU and memory usage for each process and the process associated module name. This can be used to debug which process or module uses more resource.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2011-02-16 sys proc-info(1)

---

## sys provision

**NAME**  
provision - Configures provisioning on the BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Configure the provision component within the sys module using the syntax in the following sections.

**MODIFY**  
modify provision [afm | am | apm | asm | avr | fps | gtm | ilx | lc | ltm | pem | swg | urldb | vcmp]  
options:  
cpu-ratio [integer]  
disk-ratio [integer]  
level [custom | dedicated | minimum | nominal | none]  
memory-ratio [integer]

**edit provision**  
[ [ [afm | am | apm | asm | avr | fps | gtm | ilx | lc | ltm | pem | swg | urldb | vcmp] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**

```
list provision
 [ [ [afm | am | apm | asm | avr | fps | gtm | ilx | lc | ltm | pem |
     swg | urldb | vcmp] | [glob] | [regex] ] ... ]
show running-config provision
 [ [ [afm | am | apm | asm | avr | fps | gtm | ilx | lc | ltm | pem |
     swg | urldb | vcmp] | [glob] | [regex] ] ... ]
options:
all-properties
non-default-properties
one-line
```

#### DESCRIPTION

You can use the provision component to modify the allocation of resources to the licensed modules on your system.

#### EXAMPLES

```
modify provision asm level minimum
Provisions the minimum amount of resources for the BIG-IP
Application Security Manager.
```

```
list provision
Displays the current provisioning of the system.
```

#### Using Transactions

1. create / cli transaction
2. modify / sys provision ltm level minimum
3. modify / sys provision gtm level nominal
4. submit / cli transaction

The previous four steps create a transaction to modify the provisioning of a unit to provision the Local Traffic Manager at the minimum level and the Global Traffic Manager at the nominal level.

1. create / cli transaction
2. modify / sys provision ltm level none
3. modify / sys provision gtm level dedicated
4. submit / cli transaction

The previous four steps create a transaction to modify the provisioning of a unit to dedicate all of the unit's resources to the Global Traffic Manager when currently only the Local Traffic Manager is provisioned.

#### OPTIONS

**afm** Specifies that you are provisioning the BIG-IP Advanced Firewall Manager. When the Advanced Firewall Manager is provisioned, the tmsh module security is enabled.

**am** Specifies that you are provisioning the BIG-IP Acceleration Manager. When the Acceleration Manager is provisioned, the tmsh module wam is enabled and more tmsh components under wom are available.

**apm** Specifies that you are provisioning the BIG-IP Access Policy Manager. When the Access Policy Manager is provisioned, the tmsh module apm is enabled.

**asm** Specifies that you are provisioning the BIG-IP Application Security Manager. When asm is provisioned the tmsh module asm is enabled.

**avr** Specifies that you are provisioning the BIG-IP Application Visibility and Reporting. When Application Visibility and Reporting is provisioned the tmsh module analytics is enabled.

**cpu-ratio**  
Use this option only when the level option is set to custom. F5 Networks recommends that you do not modify this option. The default value is none.

**disk-ratio**  
Use this option only when the level option is set to custom. F5 Networks recommends that you do not modify this option. The default value is none.

**fps** Specifies that you are provisioning the BIG-IP Fraud Protection Service. When fps is provisioned the tmsh module security anti-fraud is enabled.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**gtm** Specifies that you are provisioning the BIG-IP Global Traffic Manager. When gtm is provisioned the tmsh module gtm is enabled.

**ilx** Specifies that you are provisioning BIG-IP iRules Language Extensions.

**lc** Specifies that you are provisioning the BIG-IP Link Controller. When Link Controller is provisioned the tmsh module gtm is enabled.

**level**  
Specifies the level of resources that you want to provision for a module. The options are:

**custom**  
F5 Networks does not recommend that you specify this level.

**dedicated**  
Specifies that all resources are dedicated to the module you are provisioning. For all other modules, the level option must be set to none.

#### minimum

Specifies that you want to provision the minimum amount of resources for the module you are provisioning.

#### nominal

Specifies that you want to share all of the available resources equally among all of the modules that are licensed on the unit.

none Specifies that you do not want to provision any resources for this module.

ltm Specifies that you are provisioning the BIG-IP Local Traffic Manager.

#### memory-ratio

Use this option only when the level option is set to custom. F5 Networks recommends that you do not modify this option. The default value is none.

pem Specifies that you are provisioning the BIG-IP Policy Enforcement Manager. When Policy Enforcement Manager is provisioned the tmsh module pem is enabled.

#### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

swg Specifies that you are provisioning the BIG-IP Secure Web Gateway. When Secure Web Gateway is provisioned, the assumption is that Access Policy Management is already provisioned and tmsh component apm url-filter is enabled;

#### urldb

Specifies that you are provisioning the BIG-IP Secure Web Gateway with minimum resource mode. Mainly used for SSL orchestration use cases. The tmsh module urldb cannot be provisioned in BIG-IP when the tmsh module swg is already provisioned and vice-versa.

vcmp Specifies that you are provisioning the BIG-IP Virtual CMP. When Virtual CMP is provisioned the tmsh module vcmp is enabled.

#### SEE ALSO

edit, glob, list, modify, regex, show, tmsh

## sys pva-traffic

#### NAME

pva-traffic - Displays and resets Packet Velocity(r) ASIC (PVA) traffic statistics for the system.

#### MODULE

sys

#### SYNTAX

Configure the pva-traffic component within the sys module using the following syntax.

#### MODIFY

reset-stats pva-traffic

#### DISPLAY

show pva-traffic

#### options:

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
global

#### DESCRIPTION

You can use the pva-traffic component to display traffic statistics, including bits in and out, packets in and out, current, maximum, and total connections, and other miscellaneous statistics.

The BIG-IP(r) system has one PVA accelerator; however, when you run the command show pva-traffic, the system displays a PVA statistics entry for each Traffic Management Microkernel (TMM).

#### EXAMPLES

show pva-traffic

Displays PVA traffic statistics for the system.

show pva-traffic raw

Displays PVA traffic statistics for the system in raw data form.

#### OPTIONS

For information about the options that you can use with the command show, see help show.

For information about the command reset-stats, see help reset-stats.

#### SEE ALSO

reset-stats, show, sys tmm-traffic, sys traffic, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys raid array

#### NAME

array - Configures an array of hard disks on the BIG-IP(r) system.

#### MODULE

sys raid

#### SYNTAX

Configure the array component within the sys raid module using the syntax in the following sections.

#### MODIFY

modify array [name] [ [add | remove] [hard disk name] ]

#### DISPLAY

show array  
show array [name]  
options:  
field-fmt

#### DESCRIPTION

You can use the array component to add a hard disk to or remove a hard disk from an array of disks, or to display information about an array of disks.

#### EXAMPLES

show array

Displays information about all of the arrays that are configured on the system.

modify array MD1 remove HD2

Removes hard disk, HD2 from array, MD1.

#### OPTIONS

hard disk name

Specifies the name of the hard disk that you want to add to or remove from the array. This option is required for the command modify.

name Specifies the name of the array. This option is required for the command modify.

#### SEE ALSO

modify, show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2010-03-11 sys raid array(1)

---

## sys raid bay

**NAME**  
bay - Manages a BIG-IP(r) system disk drive bay.

**MODULE**  
sys raid

**SYNTAX**  
Manage the bay component within the sys raid module using the syntax in the following sections.

**MODIFY**  
modify bay [1 | 2]  
options:  
flash-led  
no-flash-led

**DISPLAY**  
show bay [1 | 2]  
options:  
field-fmt

**DESCRIPTION**  
You can use the bay component to display information about a system bay, signal the LED on a bay to flash, or signal the LED on a bay to stop flashing. The LED is helpful for identifying the location of a specific disk, see sys raid disk.

**EXAMPLES**  
modify bay 1 flash-led  
Signal the system to make the LED on bay 1 flash.  
show bay  
Displays information about the system bay.  
show bay field-fmt  
Displays information about the system bay in a field format.

**OPTIONS**  
flash-led  
Signal the LED on the bay to flash.  
no-flash-led  
Signal the LED on the bay to stop flashing.  
For information about the field-fmt option, see help show.

**SEE ALSO**  
show, sys raid disk, tmsb

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

**BIG-IP**      2011-08-29      sys raid bay(1)

---

## sys raid disk

**NAME**  
disk - Displays information about the BIG-IP(r) system disks.

**MODULE**  
sys raid

**SYNTAX**  
Display information about the disk component within the sys raid module using the syntax in the following sections.

**DISPLAY**  
show disk [name]  
options:  
field-fmt  
all-properties

#### DESCRIPTION

You can use the disk component to display information about the system disks including name, serial number, and whether the disk is a member of an array of disks. When "all-properties" option is specified, the media wear-out information of the disk is also shown. This include the wear-out indicator, space available, power-on hours, and estimated remaining life.

#### EXAMPLES

```
show disk
```

Displays information about all of the system disks.

```
show disk HD1 field-fmt
```

Displays information, in a field format, about disk, HD1.

```
show disk SSD1 all-properties
```

Displays all information (including the media wear-out information) about disk, SSD1.

#### OPTIONS

name Specifies the name of the disk for which you want to display information.

#### SEE ALSO

show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2016-03-14 sys raid disk(1)

---

## sys scriptd

#### NAME

scriptd - Configure the scriptd daemon

#### MODULE

sys

#### SYNTAX

Configure the scriptd daemon within the sys module using the syntax in the following sections.

#### MODIFY

```
modify scriptd
```

options:

```
log-level [alert | crit | debug | emerg | err | info | notice | warn]  
max-script-run-time [seconds]
```

#### DISPLAY

```
list scriptd
```

```
show running-config scriptd
```

options:

```
all-properties
```

#### DESCRIPTION

You can use the scriptd component to configure the scriptd daemon. The scriptd daemon runs app application template implementation scripts when an application service is created or updated (see sys application template and sys application service).

#### EXAMPLES

```
list scriptd
```

Displays scriptd configuration.

```
modify scriptd max-script-run-time 120
```

Updates the maximum time, in seconds, that a script is allowed to run.

#### OPTIONS

log-level

Specifies the syslog level at which scriptd will generate log messages.

max-script-run-time

Specifies, in seconds, the maximum amount of time that a script is allowed to run before scriptd will kill the script. The default value is 300. The minimum value is 5.

#### SEE ALSO

list, modify, show, sys application template, sys application service, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2009-2012. All rights reserved.

BIG-IP 2012-04-19 sys scriptd(1)

---

## sys service

#### NAME

service - Manages services on the BIG-IP(r) system.

#### MODULE

sys

#### SYNTAX

Configure the service component within the sys module using the syntax in the following sections.

##### MODIFY

modify service [name]

options:

[add | disable | enable | reinit | remove]

restart service [name]

start service [name]

stop service [name]

options:

force

##### DISPLAY

list service

list service [name]

show running-config service

show running-config service [name]

options:

all-properties

show service

options:

memstat

#### DESCRIPTION

You can use the service component to add, disable or enable, start, stop, restart, reinitialize, remove, or display information about a service.

Note that the tmsh connection to mcpd will be dropped if you stop or restart the mcpd service. The next tmsh command will prompt you to try again. Alternatively you can quit tmsh and login again.

#### EXAMPLES

list service

Displays information about the services available on the BIG-IP system.

restart service mcpd

Restarts the mcpd daemon.

#### OPTIONS

add Adds the specified service.

disable

Disables the specified service.

enable

Enables the specified service.

memstat

Displays memory usage statistics for the specified service.

reinit

Reinitializes the specified service.

remove

Removes the specified service.

#### SEE ALSO

list, modify, restart, show, start, stop, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying,

recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys sflow data-source http

**NAME**  
http - Displays the status of all HTTP sFlow data sources on the BIG-IP system.

**MODULE**  
sys sflow data-source

**SYNTAX**  
Display the status of http component within the sys sflow data-source module using the syntax shown in the following sections.

**DISPLAY**  
show http  
options:  
all-properties  
field-fmt

**DESCRIPTION**  
You can use the http component to display the current status of all HTTP sFlow data sources on the BIG-IP system.

**EXAMPLES**  
show http  
  
Displays the current status of all HTTP sFlow data sources.

**SEE ALSO**  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys sflow data-source interface

**NAME**  
interface - Displays the status of all sFlow data sources (interfaces) on the BIG-IP system.

**MODULE**  
sys sflow data-source

**SYNTAX**  
Display the status of interface component within the sys sflow data-source module using the syntax shown in the following sections.

**DISPLAY**  
show interface  
options:  
all-properties  
field-fmt

**DESCRIPTION**  
You can use the interface component to display the current status of all sFlow data sources (interfaces) on the BIG-IP system.

**EXAMPLES**  
show interface  
  
Displays the current status of all sFlow data sources (interfaces).

SEE ALSO  
show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2012-12-28 sys sflow data-source system(1)

---

## sys sflow data-source vlan

**NAME**  
vlan - Displays the status of all sFlow data sources (VLANs) on the BIG-IP system.

**MODULE**  
sys sflow data-source

**SYNTAX**  
Display the status of vlan component within the sys sflow data-source module using the syntax shown in the following sections.

**DISPLAY**  
show vlan  
options:  
all-properties  
field-fmt

**DESCRIPTION**

You can use the vlan component to display the current status of all sFlow data sources (VLANs) on the BIG-IP system.

#### EXAMPLES

```
show vlan
```

Displays the current status of all sFlow data sources (VLANs).

#### SEE ALSO

```
show, tmsh
```

#### COPYRIGHT

## sys sflow global-settings http

#### NAME

http - Manages the global HTTP sFlow configuration on the BIG-IP system.

#### MODULE

```
sys sflow global-settings
```

#### SYNTAX

Configure the http component within the sys sflow global-settings module using the syntax shown in the following sections.

#### MODIFY

```
modify http
options:
description [string]
poll-interval [integer]
sampling-rate [integer]
```

#### DISPLAY

```
list http
options:
all-properties
non-default-properties
one-line
```

#### DESCRIPTION

You can use the http component to modify or list the global HTTP sFlow configuration on the BIG-IP system.

Note: You can modify the global HTTP sFlow configuration on the BIG-IP system, only if you are assigned either the Resource Administrator or Administrator user role.

#### EXAMPLES

```
modify http poll-interval 60 sampling-rate 1500
```

Sets the poll-interval to 60 seconds and the sampling-rate to 1500 packets for all monitored HTTP data sources on the BIG-IP system.

#### OPTIONS

```
description
User defined description.
```

```
poll-interval
Specifies the maximum interval in seconds between polling by the sFlow agent of all monitored HTTP data sources on the BIG-IP system. The default value is 10.
```

```
sampling-rate
Specifies the ratio of packets observed at all HTTP data sources to the samples generated. For example, a sampling rate of 2000 specifies that 1 sample will be randomly generated for every 2000 packets observed. The default value is 1024.
```

#### SEE ALSO

```
list, modify, tmsh
```

#### COPYRIGHT

## sys sflow global-settings interface

**NAME**  
interface - Manages the global sFlow configuration for interfaces on the BIG-IP system.

**MODULE**  
sys sflow global-settings

**SYNTAX**  
Configure the interface component within the sys sflow global-settings module using the syntax shown in the following sections.

**MODIFY**  
modify interface  
options:  
description [string]  
poll-interval [integer]

**DISPLAY**  
list interface  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
You can use the interface component to modify or list the global sFlow configuration for interfaces on the BIG-IP system.

Note: You can modify the global sFlow configuration for interfaces on the BIG-IP system, only if you are assigned either the Resource Administrator or Administrator user role.

**EXAMPLES**  
modify interface poll-interval 60

Sets the poll-interval to 60 seconds for all monitored data sources (interfaces) on the BIG-IP system.

**OPTIONS**  
description  
User defined description.

poll-interval  
Specifies the maximum interval in seconds between polling by the sFlow agent of all monitored data sources (interfaces) on the BIG-IP system. The default value is 10.

**SEE ALSO**

## sys sflow global-settings system

**NAME**  
system - Manages the global system sFlow configuration on the BIG-IP system.

**MODULE**  
sys sflow global-settings

**SYNTAX**  
Configure the system component within the sys sflow global-settings module using the syntax shown in the following sections.

**MODIFY**  
modify system  
options:  
description [string]  
poll-interval [integer]

**DISPLAY**  
list system  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
You can use the system component to modify or list the global system sFlow configuration on the BIG-IP system.

**Note:** You can modify the global system sFlow configuration on the BIG-IP system, only if you are assigned either the Resource Administrator or Administrator user role.

**EXAMPLES**  
modify system poll-interval 60

Sets the poll-interval to 60 seconds for the system data sources on the BIG-IP system.

**OPTIONS**  
description  
User defined description.

poll-interval  
Specifies the maximum interval in seconds between polling by the sFlow agent of the system data sources on the BIG-IP system. The default value is 10.

## sys sflow global-settings vlan

**NAME**  
vlan - Manages the global sFlow configuration for VLANs on the BIG-IP system.

**MODULE**  
sys sflow global-settings

**SYNTAX**  
Configure the vlan component within the sys sflow global-settings module using the syntax shown in the following sections.

**MODIFY**  
modify vlan  
options:  
description [string]  
poll-interval [integer]  
sampling-rate [integer]

**DISPLAY**  
list vlan  
options:  
all-properties  
non-default-properties  
one-line

**DESCRIPTION**  
You can use the vlan component to modify or list the global sFlow configuration for VLANs on the BIG-IP system.

**Note:** You can modify the global sFlow configuration for VLANs on the BIG-IP system, only if you are assigned either the Resource Administrator or Administrator user role.

**EXAMPLES**  
modify vlan poll-interval 60 sampling-rate 1500

Sets the poll-interval to 60 seconds and the sampling-rate to 1500 packets for all monitored data sources (VLANs) on the BIG-IP system.

## OPTIONS

**description**  
User defined description.

**poll-interval**  
Specifies the maximum interval in seconds between polling by the sFlow agent of all monitored data sources (VLANs) on the BIG-IP system. The default value is 10.

**sampling-rate**  
Specifies the ratio of packets observed at all data sources (VLANs) to the samples generated. For example, a sampling rate of 2000 specifies that 1 sample will be randomly generated for every 2000 packets observed. The default value is 2048.

## sys sflow receiver

### NAME

receiver - Manages sFlow receivers configured on the BIG-IP system.

### MODULE

sys sflow

### SYNTAX

Configure the receiver component within the sys sflow module using the syntax shown in the following sections.

#### CREATE/MODIFY

```
create receiver [name]
modify receiver [name]
options:
  address [ip address]
  app-service [[string] | none]
  description [string]
  max-datagram-size [integer]
  port [ip port]
  state [disabled | enabled]
```

#### DISPLAY

```
list receiver
list receiver [ [ name ] | [ glob ] | [ regex ] ] ... ]
options:
  all-properties
  one-line
```

#### DELETE

```
delete receiver [name]
```

### DESCRIPTION

You can use the receiver component to create, delete, list, or modify an sFlow receiver object on the BIG-IP system.

**Note:** You can add an sFlow receiver to the BIG-IP system, only if you are assigned either the Resource Administrator or Administrator user role.

### EXAMPLES

```
create receiver my_receiver address 10.10.10.10
```

Creates an sFlow receiver object named my\_receiver with an IP address of 10.10.10.10, where the port, max-datagram-size, and state options are set to default values.

```
create receiver my_receiver address 10.20.10.20 port 1234 state enabled
```

Creates an sFlow receiver object named my\_receiver with an IP address of 10.20.10.20, a port of 1234, and the max-datagram-size option set to default value. The state of the receiver is enabled.

```
modify receiver my_receiver state enabled
```

Changes the state of sFlow receiver object named my\_receiver to enabled.

### OPTIONS

**address**  
Specifies the IP address on which the sFlow receiver listens for

UDP datagrams. This option is required for the create command.

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**description**  
User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**max-datagram-size**  
Specifies the maximum size in bytes of the UDP datagram the sFlow receiver accepts. The default value is 1400.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**port** Specifies the port on which the sFlow receiver listens for UDP datagrams. The default value is the standard sFlow port, 6343.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**state**  
Specifies the state of the receiver. The sFlow samples will be collected and sent to the receiver when enabled. The default value is disabled.

**SEE ALSO**

## sys smtp-server

**NAME**  
smtp-server - Configure the SMTP server connection.

**MODULE**  
sys

**SYNTAX**  
Create or modify an SMTP server access configuration using the syntax in the following sections.

**CREATE / MODIFY**  
modify smtp-server [name]  
create smtp-server [name]  
options:  
app-service [[string] | none]  
[authentication-enabled | authentication-disabled]  
encrypted-connection [none | tls | ssl]  
local-host-name [string]  
smtp-server-host-name [string]  
smtp-server-port [integer]  
from-address [string]  
username [string]  
password [string]

**DISPLAY**  
list smtp-server  
show running-config smtp-server  
options:  
all-properties

**DESCRIPTION**  
You can use the smtp-server component to configure an SMTP server connection.

**EXAMPLES**  
list smtp-server  
  
Displays the SMTP configuration.

```
modify smtp-server smtp1 authentication-enabled encrypted-connection
ssl local-host-name example.f5.com from-address example@f5.com smtp-
server-host-name mail.server.com username user password pass
```

Configures SMTP server connection with username=user and password=pass to be authenticated against the SMTP server mail.server.com. SSL encryption will be used for all communication with the SMTP server. Email messages will be sent out with the address example@f5.com in the "Reply-To" address.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

[authentication-enabled | authentication-disabled]

Enables or disables authentication against the configured SMTP server.

##### encrypted-connection

Specifies which type of encrypted connection the SMTP server requires in order to send mail. The default value is none.

##### local-host-name

Specifies the host name used in SMTP headers in the format of a fully qualified domain name. This setting does not refer to the BIG-IP system's Hostname.

##### smtp-server-host-name

Specifies the SMTP server host name in the format of a fully qualified domain name.

##### smtp-server-port

Specifies the SMTP port number. The default value is 25.

##### from-address

Specifies the email address that the email is being sent from. This is the "Reply-to" address that the recipient sees.

##### username

Specifies the user name that the SMTP server requires when validating a user.

##### password

Specifies the password that the SMTP server requires when validating a user. This password is stored in an encrypted form.

#### SEE ALSO

list, create, modify, show, tmsh

#### COPYRIGHT

```

```
edit snmp
  options:
    all-properties
    non-default-properties

  DISPLAY
list snmp
list snmp [option]
show running-config snmp
show running-config snmp [option]
  options:
    all-properties
    non-default-properties
    one-line
```

#### DESCRIPTION

You can use the snmp component to configure the snmpd daemon for the BIG-IP system.

**Important:** F5 Networks recommends that users of the Configuration utility exit the utility before changes are made to the system using the command sequence `tmsch sys snmp`. This is because making changes to the system using this command causes a restart of the snmpd daemon. Likewise, restarting the snmpd daemon creates the necessity for a restart of the Configuration utility.

#### EXAMPLES

```
modify snmp sys-contact admin@company.com
```

Modifies the configuration to indicate that the person who administers the snmpd daemon for the system can be reached using the email address, `admin@company.com`.

```
modify snmp sys-location "central office"
```

Modifies the configuration to indicate that the physical location of the system is the central office.

```
modify snmp snmpv1 disabled
```

Disables snmpV1 agent support.

```
modify snmp snmpv2c disabled
```

Disables snmpV2c agent support.

```
modify snmp agent-trap disabled
```

Disables agent traps.

```
modify snmp allowed-addresses add {10.10.0.0/255.255.240.0}
```

Adds a range of SNMP clients to the `/etc/hosts.allow` file.

```
modify snmp traps add { tv1 { version 1 community public host
192.168.1.240 port 162 } }
```

Adds an SNMP version 1 trapsess, `tv1`, to the system. The destination IP address of `tv1` is `192.168.1.240`, the port is `162`, and the community that has access to `tv1` is `public`. The default port is `162`.

```
modify snmp traps add { tv2 {version 2c community public host
192.168.1.241 port 162} }
```

Adds an SNMP version 2 trapsess, `tv2`, to the system. The destination IP address of `tv2` is `192.168.1.241`, the port is `162`, and the community that has access to `tv2` is `public`. The default port is `162`. The default version is `2c` (version 2).

```
modify snmp traps add { trap_v3_1 { version 3 host 192.168.1.242 port
162 security-level auth-no-privacy security-name mySecurityName auth-
protocol md5 auth-password myAuthPassword } }
```

Adds an SNMP version 3 trapsess, `trap_v3_1`, with authentication capabilities to the system. The destination IP address of `trap_v3_1` is `192.168.1.242`, the port is `162`, the security level is the authentication without privacy, the security name is `mySecurityName`, the authentication protocol is `MD5`, and the authentication password is `myAuthPassword`. The default port is `162`.

```
modify snmp traps add { trap_v3_2 { version 3 host 192.168.1.243 port
162 security-level auth-privacy security-name mySecurityName auth-
protocol sha auth-password myAuthPassword privacy-protocol aes privacy-
password myPrivacyPassword } }
```

Adds an SNMP version 3 trapsess, `trap_v3_2`, with authentication and privacy capabilities to the system. The destination IP address of `trap_v3_2` is `192.168.1.243`, the port is `162`, the security level is the authentication and privacy, the security name is `mySecurityName`, the authentication protocol is `SHA`, the authentication password is `myAuthPassword`, the privacy protocol is `AES`, and the privacy password is `myPrivacyPassword`. The default port is `162`.

```
modify snmp v1-traps add { ts { community public host 10.20.5.11 port
162 } }
```

Adds an SNMP version 1 trapsink, `ts`, to the system. The destination IP address of `ts` is `10.20.5.11`, the port is `162`, and the community that has access to `ts` is `public`. The default port is `162`.

```
modify snmp v2-traps add { t2s { community public host 10.20.5.12 port
162 } }
```

Adds an SNMP version 2 trap2sink, t2s, to the system. The destination IP address of t2s is 10.20.5.12, the port is 162, and the community that has access to t2s is public. The default port is 162.

```
modify snmp users add { myUser1 { username myUser1 access ro security-level auth-no-privacy auth-protocol md5 auth-password myAuthPassword privacy-protocol } }
```

Adds an SNMP version 3 user with the user name, myUser1, to the system. The access to the management information base (MIB) of myUser1 is read-only, the security level is the authentication without privacy, the authentication protocol is MD5, and the authentication password is myAuthPassword.

```
modify snmp users add { myUser2 { username myUser2 oid-subset .1.3.6.1.4.1.3375 auth-protocol md5 auth-password myAuthPassword privacy-protocol none } }
```

Adds an SNMP version 3 user with the user name, myUser2, to the system. The access to the management information base (MIB) of myUser2 is read-only (by default) and restricted to every object below .1.3.6.1.4.1.3375 object identifier in the MIB tree, the security level is the authentication without privacy, the authentication protocol is MD5, and the authentication password is myAuthPassword.

```
modify snmp users add { myUser3 { username myUser3 access ro security-level auth-privacy auth-protocol sha auth-password myAuthPassword privacy-protocol des privacy-password myPrivacyPassword } }
```

Adds an SNMP version 3 user with the user name, myUser3, to the system. The access to the management information base (MIB) of myUser3 is read-only, the security level is the authentication and privacy, the authentication protocol is SHA, the authentication password is myAuthPassword, the privacy protocol is DES, and the privacy password is myPrivacyPassword.

```
modify snmp users add { myUser4 { username myUser4 access ro security-level no-auth-no-privacy auth-protocol none privacy-protocol none } }
```

Adds an SNMP version 3 user with the user name, myUser4, to the system. The access to the management information base (MIB) of myUser4 is read-only without the authentication and privacy settings.

```
modify snmp communities add { community1 { community-name mycommunity access ro source 192.168.1.246 oid-subset 5 ipv6 disabled } }
```

Creates a community specification named community1 for the BIG-IP system. community1 includes a community, named mycommunity, that provides read-only access to the host at 192.168.1.246. This host cannot be an IPv6 address. The oid for this community is 5.

```
modify snmp communities add { new-name { community-name public source default oid-subset 1 access ro } }
```

Replaces the default community specification for the BIG-IP system. Using this command, the default community includes a community, named public, that provides read-only access to the default host. The oid for this community is 1.

```
modify snmp communities delete { mycommunity }
```

Deletes the community named mycommunity.

```
modify snmp load-max1 0 load-max5 0 load-max15 0
```

Disables monitoring of snmpd load average on the BIG-IP system.

## OPTIONS

### snmpv1

Specifies, when enabled, that the snmpd daemon supports snmpV1 queries. The default value is enabled.

### snmpv2c

Specifies, when enabled, that the snmpd daemon supports snmpV2c queries. The default value is enabled.

### agent-addresses

Indicates that the SNMP agent is to listen on the specified address. F5 Networks recommends that you do not change this setting without fully understanding the impact of the change.

### agent-trap

Specifies, when enabled, that the snmpd daemon sends traps, for example, start and stop traps. The default value is enabled.

### allowed-addresses

Configures the IP addresses of the SNMP clients from which the snmpd daemon accepts requests. An SNMP client is a system that runs the SNMP manager software for the purpose of remotely managing the BIG-IP system. The default value is 127.

### auth-trap

Specifies, when enabled, that the snmpd daemon generates authentication failure traps. The default value is disabled.

### bigip-traps

Specifies, when enabled, that the BIG-IP system sends device warning traps to the trap destinations. The default value is enabled.

### community

Configures a community for the snmpd daemon. Note that you must include a community key, and you must enclose the attributes in braces.

The options are additive and include:

**access**

Specifies the community access level to the MIB. The access options are ro (read-only) or rw (read-write). The default value is ro.

**community name**

Specifies the name of the community that you are configuring for the snmpd daemon. This option is required. The default value is public.

**description**

User defined description.

**ipv6** Specifies to enable or disable IPv6 addresses for the community that you are configuring. The default value is disabled.

**oid-subset**

Specifies to restrict access by the community to every object below the specified object identifier (OID).

**source**

Specifies the source addresses with the specified community name that can access the management information base (MIB). The default value is default, which means allow any source address to access the MIB.

**description**

User defined description.

**disk-monitors**

Checks the disks mounted at the specified path for available disk space.

The options are:

**description**

User defined description.

**minspace**

Specifies the minimum disk space threshold in either kB or percentage based on the value of the minspace-type option. If the available disk space is less than this amount, the associated entry in the 1.3.6.1.4.1.2021.9.1.100 MIB table is set to (1) and a descriptive error message is returned to queries of 1.3.6.1.4.1.2021.9.1.101.

**minspace-type**

Specifies a minimum disk space measurement type of either size in kB, or percent. Note that the value of the minspace option is based on the value of this option.

**path** Specifies the path to the disk that the system checks for disk space. This option is required.

**include**

Warning: Do not use this parameter without assistance from the F5 Technical Support team. The system does not validate the commands issued using the include parameter. If you use this parameter incorrectly, you put the functionality of the system at risk.

**l2forward-vlan**

Specifies the VLANs for which you want the snmpd daemon to expose Layer 2 forwarding information. Layer 2 forwarding is the means by which frames are exchanged directly between hosts, with no IP routing required. The default value is none.

The options are:

**all** The snmpd daemon exposes Layer 2 forwarding information for all VLANs.

Warning: When you set this option to all, the system can create a very large table of statistics and potentially affect system performance.

**none** Indicates that this option is not set.

Important: The default is not the same as setting this option to the string "none," which indicates that you do not want the snmpd daemon to expose Layer 2 forwarding for any VLAN.

**VLAN name**

Specifies the names of the VLANs for which the snmpd daemon exposes Layer 2 forwarding information. The snmpd daemon overwrites the value of the sysL2ForwardAttrVlan object identifier (OID) with the specified VLAN names. Once you set this parameter, users cannot change the value of the sysL2ForwardAttrVlan OID using the SNMP set method.

**load-max1**

Specifies the maximum 1-minute load average of the machine. If the load exceeds this threshold, the associated entry in the 1.3.6.1.4.1.2021.10.1.100 MIB table is set to (1) and a descriptive error message is returned to queries of 1.3.6.1.4.1.2021.10.1.101.

Note that when you specify a 0 (zero) for all three of the load-max1, load-max5, and load-max15 options, the system does not monitor the load average.

#### load-max5

Specifies the maximum 5-minute load average of the machine. If the load exceeds this threshold, the associated entry in the 1.3.6.1.4.1.2021.10.1.100 MIB table is set to (1) and a descriptive error message is returned to queries of 1.3.6.1.4.1.2021.10.1.101.

Note that when you specify a 0 (zero) for all three of the load-max1, load-max5, and load-max15 options, the system does not monitor the load average.

#### load-max15

Specifies the maximum 15-minute load average of the machine. If the load exceeds this threshold, the associated entry in the 1.3.6.1.4.1.2021.10.1.100 MIB table is set to (1) and a descriptive error message is returned to queries of 1.3.6.1.4.1.2021.10.1.101.

Note that when you specify a 0 (zero) for all three of the load-max1, load-max5, and load-max15 options, the system does not monitor the load average.

#### process-monitors

Specifies to check the machine to determine if the specified process is running. An error flag (1) and a description message are passed to the 1.3.6.1.4.1.2021.2.1.100 and 1.3.6.1.4.1.2021.2.1.101 MIB columns (respectively) if the specified program is not found in the process table as reported by /bin/ps -e.

F5 Networks recommends that you do not modify or delete system processes; however, you can add, modify, or delete user-defined processes.

The options are:

#### description

User defined description.

#### max-processes

Specifies the maximum number of instances of the process that can run. The default value is 1.

If you do not specify values for the min-processes and max-processes options, the max-processes option is 1 by default.

#### min-processes

Specifies the minimum number of instances of the process that can run. The default value is 1.

If you do not specify a value for the max-processes option, and the min-processes option is not specified, the min-processes option is 0 (zero) by default.

#### process

Specifies the name of the monitored process. The maximum length for a process name is 16 characters. This option is required.

#### sys-contact

Specifies the name of the person who administers the snmpd daemon for this system. The default value is "Customer Name"

---

## sys software block-device-hotfix

#### NAME

block-device-software-hotfix - Manages F5 Networks block device software hotfixes.

#### MODULE

sys software

#### SYNTAX

Install or display information about a block-device-hotfix using the syntax in the following sections.

#### INSTALL

install block-device-hotfix [name] volume [name]

#### options:

create-volume  
reboot

#### DISPLAY

list block-device-hotfix

list block-device-hotfix [ [ [ name [/slot\_id] ] | [glob] | [regex] ] ... ]

#### options:

build  
checksum

device-agent  
id  
one-line  
product  
title  
resource-id  
verified  
version

#### DESCRIPTION

You can use the block-device-hotfix component to install a block-device-hotfix onto a volume, or view information about available block-device-hotfixes.

Use the create-volume option with the block-device-hotfix component to create new volumes.

Note: You use the slot\_id option only for chassis systems and only when displaying the values for the options of a specific block-device-hotfix. You do not use the slot\_id option when installing or deleting a block-device-hotfix, because these commands operate on all blades or the entire system.

#### EXAMPLES

```
list block-device-hotfix Hotfix-BIGIP-11.4.0-2419.0-HF3.iso
```

Displays information about the specified block-device-hotfix, BIGIP-9.6.1-824.0-HF3.im.

```
list block-device-hotfix */1
```

Displays information about the all the block-device-hotfixes on the first slot.

```
install block-device-hotfix Hotfix-BIGIP-11.4.0-2419.0-HF3.iso volume HD1.1 reboot
```

Attempts to install the specified block-device-hotfix, Hotfix-BIGIP-11.4.0-2419.0-HF3.iso, onto HD1.1.

Note: If the installation is successful, and you used the reboot option, as in this example, the machine reboots into the newly installed block-device-hotfix.

#### OPTIONS

build

Displays the build number of the block-device-hotfix.

checksum

Displays the checksum of the block-device-hotfix.

create-volume

Create a new volume using the name specified with the volume option. Mirrored volume names must begin with the prefix MD1.. Mirrored volumes are available only on systems that support RAID, see sys raid.

device-agent

Displays the name of the service which is responsible for managing the type of block device on which a give hotfix is available. vcmp-virtual-cdrom is the device-agent which allows VCMF guests to install hotfixes that reside in the host system, via a virtual cdrom device.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies the name and sequential ID of the block-device-hotfix that you want to install or delete.

product

Displays the F5 Networks product this block-device-hotfix contains.

reboot

Specifies that the system reboots immediately after a successful installation.

resource-id

Displays the resource-id string corresponding to software block-device-hotfix in question. This string is used to identify the image for use in interacting with the device agent that is responsible for management of the resource. In the case of the vcmp-virtual-cdrom device-agent the resource-id is used by the live installation daemon when requesting that the hypervisor make hotfixes available before the installation can proceed.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

slot\_id

Specifies the number of the slot on a chassis system that contains the block-device-hotfix about which you want to display information.

title

Displays a textual description of the block-device-hotfix.

verified

When set to yes, indicates that the block-device-hotfix is authentic.

**version**  
Displays the version number of the product the block-device-hotfix contains.

**volume**  
Specifies the name of the volume on which you want to install the block-device-hotfix, or from which you want to delete the block-device-hotfix.

**SEE ALSO**  
delete, glob, install, list, regex, sys software block-device-image, sys software hotfix, sys software image, tmsh

**COPYRIGHT**

## sys software block-device-image

**NAME**  
block-device-image - Manages F5 Networks block device software images.

**MODULE**  
sys software

**SYNTAX**  
Install or display information about a block-device-image using the syntax in the following sections.

**INSTALL**  
install  
options:  
create-volume  
image [name]  
reboot  
volume [name]

**DISPLAY**  
list block-device-image  
list block-device-image [ [ [ name [/slot\_id] ] | [glob] | [regex] ] ... ]  
options:  
build  
build-date  
checksum  
device-agent  
file-size  
last-modified  
one-line  
product  
resource-id  
verified  
version

**DESCRIPTION**  
You can use the block-device-image component to install images from block devices onto a volume, or view information about available block-device-images.

**INSTALLING A SOFTWARE BLOCK-DEVICE-IMAGE**  
Before you begin installing a block-device-image, the image must be made available to the system. As of this writing, block device images are only available from within a VCMP guest via a virtual cdrom service. A VCMP host administrator must have provided the images for use by the guest as part of their administration of the VCMP host.

From tmsh, you can use show sys software status to see all of the available disk volumes where you can install the image. You can install the image file in any volume that is not active.

Then use the install command with this component to install the image to an unused volume. You can use the create-volume option if you want to create a new volume. The installation takes some time; you can use show sys software status repetitively to watch the progress of the installation. To put the newly installed software into active service, use the reboot option in the install command, or use the reboot volume vol-name command after the install command completes.

**Note:** You use the slot\_id option only for chassis systems and only when displaying the values for the options of a specific block-device-image.

You do not use the `slot_id` option when installing or deleting a block-device-image, because these commands operate on all blades or the entire system.

#### CONFIRMING AN BLOCK-DEVICE-IMAGE INSTALLATION

You can use `show sys version` to confirm that the system is running the new software version. If this is a new module for the current system, you may need to use `show sys license` and/or `install sys license` to update your license. For a new module, you may also need to provision CPU, memory, and disk space for the module with the `sys provision` component.

#### EXAMPLES

```
install block-device-image BIGIP-11.4.1.608.0.iso volume HD1.1 reboot
```

Attempts to install the specified block-device-image, `BIGIP-11.4.1.608.0.iso`, onto `HD1.1`. Note: If the installation is successful, the machine reboots into the newly installed block-device-image.

```
list block-device-image BIGIP-11.4.1.608.0.iso
```

Displays information about the specified block-device-image, build 608.0 of BIG-IP version 11.4.1.

```
list block-device-image */1
```

Displays information about all of the block-device-images located on the first slot.

#### OPTIONS

`build`

Displays the build number of the block-device-image.

`build-date`

Displays the date on which the block-device-image was built.

`checksum`

Displays the checksum of the block-device-image. You can use this option to verify the integrity of the block-device-image.

`create-volume`

Creates a new volume using the name specified with the `volume` option. Mirrored volume names must begin with the prefix `MD1..`. Mirrored volumes are available only on systems that support RAID, see `sys raid`.

`device-agent`

Displays the name of the service which is responsible for managing the type of block device on which a give image is available. `vcmp-virtual-cdrom` is the device-agent which allows VCMP guests to install images that reside in the host system, via a virtual cdrom device.

`file-size`

Displays the size of the block-device-image file in megabytes.

`glob` Displays the items that match the glob expression. See `help glob` for a description of glob expression syntax.

`last-modified`

Displays the date the file was last modified.

`name` Specifies the name of the block-device-image that you want to install or delete.

`product`

Displays the F5 Networks product the block-device-image contains.

`reboot`

Specifies that the system reboots immediately after a successful installation.

`regex`

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (`@[regular expression]`) to indicate that the identifier is a regular expression. See `help regex` for a description of regular expression syntax.

`resource-id`

Displays the `resource-id` string corresponding to software image in question. This string is used to identify the image for use in interacting with the device agent that is responsible for management of the resource. In the case of the `vcmp-virtual-cdrom` device-agent the `resource-id` is used by the live installation daemon when requesting that the hypervisor make images available, before the installation can proceed.

`verified`

When set to `yes`, indicates that the block-device-image is authentic.

`version`

Displays the version number of the product this block-device-image contains.

`volume`

Specifies the name of the volume on which you want to install the block-device-image, or from which you want to delete the block-device-image.

Note: You cannot install software on the active volume.

## sys software hotfix

#### NAME

hotfix - Manages F5 Networks software hotfixes.

#### MODULE

sys software

#### SYNTAX

Install, display information about, or delete a hotfix using the syntax in the following sections.

##### INSTALL

install hotfix [name] volume [name]

##### options:

create-volume  
reboot

##### DISPLAY

list hotfix

list hotfix [ [ [ name [/slot\_id] ] | [glob] | [regex] ] ... ]

##### options:

build  
checksum  
id  
one-line  
product  
title  
verified  
version

##### DELETE

delete hotfix [ [name] ... ]

##### options:

all

#### DESCRIPTION

You can use the hotfix component to install a hotfix onto a volume, view information about available hotfixes, or delete unwanted hotfixes.

Use the create-volume option with the hotfix component to create new volumes.

Note: You use the slot\_id option only for chassis systems and only when displaying the values for the options of a specific hotfix. You do not use the slot\_id option when installing or deleting a hotfix, because these commands operate on all blades or the entire system.

#### EXAMPLES

list hotfix Hotfix-BIGIP-9.6.1-824.0-HF3.im

Displays information about the specified hotfix, BIGIP-9.6.1-824.0-HF3.im.

list hotfix \*/1

Displays information about the all the hotfixes on the first slot.

install hotfix Hotfix-BIGIP-9.6.1-824.0-HF3.im volume HD1.1 reboot

Attempts to install the specified hotfix, BIGIP-9.6.1-824.0-HF3.im, onto HD1.1.

Note: If the installation is successful, and you used the reboot option, as in this example, the machine reboots into the newly installed hotfix.

#### OPTIONS

build

Displays the build number of the hotfix.

checksum

Displays the checksum of the hotfix. You can use this option to verify the integrity of the hotfix.

**create-volume**

Create a new volume using the name specified with the volume option. Mirrored volume names must begin with the prefix MD1.. Mirrored volumes are available only on systems that support RAID, see sys raid.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies the name and sequential ID of the hotfix that you want to install or delete.

**product**

Displays the F5 Networks product this hotfix contains.

**reboot**

Specifies that the system reboots immediately after a successful installation.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**slot\_id**

Specifies the number of the slot on a chassis system that contains the hotfix about which you want to display information.

**title**

Displays a textual description of the hotfix.

**verified**

When set to yes, indicates that the hotfix is authentic.

**version**

Displays the version number of the product the hotfix contains.

**volume**

Specifies the name of the volume on which you want to install the hotfix, or from which you want to delete the hotfix.

**SEE ALSO**

delete, glob, install, list, regex, sys software image, tmsd

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## sys software image

**NAME**

image - Manages F5 Networks software images.

**MODULE**

sys software

**SYNTAX**

Install, display information about, or delete a software image using the syntax in the following sections.

**INSTALL**

install

**options:**

create-volume  
image [name]  
reboot  
volume [name]

**DISPLAY**

list image

list image [ [ [ name [/slot\_id] ] | [glob] | [regex] ] ... ]

**options:**

build  
build-date  
checksum  
file-size

last-modified  
one-line  
product  
verified  
version

#### DELETE

delete image [ [name] ... ] | [all] ]

#### DESCRIPTION

You can use the image component to install images onto a volume, view information about available images, or delete unwanted images.

#### INSTALLING A SOFTWARE IMAGE

Before you begin installing an image, you must download the image file into the /shared/images directory. You can find new software images at <http://downloads.f5.com>. We recommend downloading both the .iso file and the .md5 file. Download the file (or files) to your local machine, then transfer it to the /shared/images directory on the BIG-IP(r). Use the Manager (GUI) interface to make this transfer, or quit tmsh to the Unix command line and use scp or a similar Unix command.

If you downloaded the .md5 file, you can use the Unix md5sum command to check the MD5 hash of the .iso file, and you can compare it to the contents of the .md5 file. They should match. If they do not, retry the download and/or transfer of the .iso file.

From tmsh, you can use show sys software status to see all of the available disk volumes where you can install the .iso file. You can install the .iso file in any volume that is not active.

Then use the install command with this component to install the .iso file to an unused volume. You can use the create-volume option if you want to create a new volume. The installation takes some time; you can use show sys software status repetitively to watch the progress of the installation. To put the .iso file into active service, use the reboot option in the install command, or use the reboot volume vol-name command after the install command completes.

Note: You use the slot\_id option only for chassis systems and only when displaying the values for the options of a specific image. You do not use the slot\_id option when installing or deleting an image, because these commands operate on all blades or the entire system.

#### CONFIRMING AN IMAGE INSTALLATION

You can use show sys version to confirm that the system is running the new software version. If this is a new module for the current system, you may need to use show sys license and/or install sys license to update your license. For a new module, you may also need to provision CPU, memory, and disk space for the module with the sys provision component.

#### EXAMPLES

```
install image BIGIP-10.0.0.5376.0.iso volume HD1.1 reboot
```

Attempts to install the specified image, BIGIP-10.0.0.5376.0.iso, onto HD1.1. Note: If the installation is successful, the machine reboots into the newly installed image.

```
list image BIGIP-10.0.0.5376.0.iso
```

Displays information about the specified image, build 5376.0 of BIG-IP version 10.0.0.

```
list image */1
```

Displays information about all of the images located on the first slot.

#### OPTIONS

##### build

Displays the build number of the image.

##### build-date

Displays the date on which the image was built.

##### checksum

Displays the checksum of the image. You can use this option to verify the integrity of the image.

##### create-volume

Creates a new volume using the name specified with the volume option. Mirrored volume names must begin with the prefix MD1.. Mirrored volumes are available only on systems that support RAID, see sys raid.

##### file-size

Displays the size of the image file in megabytes.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

##### last-modified

Displays the date the file was last modified.

name Specifies the name of the image that you want to install or delete.

##### product

Displays the F5 Networks product the image contains.

##### reboot

Specifies that the system reboots immediately after a successful installation.

**regex**  
Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**verified**  
When set to yes, indicates that the image is authentic.

**version**  
Displays the version number of the product this image contains.

**volume**  
Specifies the name of the volume on which you want to install the image, or from which you want to delete the image.

Note: You cannot install software on the active volume.

**SEE ALSO**

delete, glob, install, list, reboot, regex, sys software hotfix, tms, show, sys software status, sys version, sys license, sys provision

## sys software signature

**NAME**

signature - Manages F5 Networks software signatures.

**MODULE**

sys software

**SYNTAX**

Display information about, or delete a signature using the syntax in the following sections.

**DISPLAY**

list signature  
list signature [ [ [ name [/slot\_id] ] | [glob] | [regex] ] ... ]  
options:  
one-line

**DELETE**

delete signature [ [name] ... ]  
options:  
all

**DESCRIPTION**

You can use the signature component to view information about available signatures, or delete unwanted signatures.

Note: You use the slot\_id option only for chassis systems and only when displaying the values for the options of a specific signature. You do not use the slot\_id option when deleting a signature, because these commands operate on all blades or the entire system.

**EXAMPLES**

list signature BIGIP-11.5.0.0.135.iso.sig

Displays information about the specified signature, BIGIP-11.5.0.0.135.iso.sig.

list signature \*/1

Displays information about the all the signatures on the first slot.

**OPTIONS**

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**slot\_id**

Specifies the number of the slot on a chassis system that contains the hotfix about which you want to display information.

**SEE ALSO**

delete, glob, list, regex, sys software image, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2013-11-18 sys software signature(1)

---

## sys software status

**NAME**

status - Displays the status of a BIG-IP(r) system software installation.

**MODULE**

sys software

**SYNTAX**

Display information about the status component within the sys software module using the following syntax.

**DISPLAY**

show status  
options:  
field-fmt

**DESCRIPTION**

You can use the status component to display the status of the software installation, including whether the system is active, the name of the product being installed, the software version and build number of the software, and the slot and volume on which the software is installed.

After you use the install sys software image command (see install and "sys software image") to install a new software image, you can use this command to monitor the progress of the installation. A percentage meter appears in the Status column.

**EXAMPLES**

show status

Displays the status of the software installation in a table.

show status field-fmt

Displays the status of the software installation separately for each volume on the system.

```
root@(big-ip1)(cfg-sync Standalone)(Active)(/Common)(tmsh)# quit  
[root@big-ip1:Active:Standalone] images # watch tmsh show sys software status
```

Launches the Unix watch command from the Unix command line. The command produces auto-updating output similar to this:

```
Every 2.0s: tmsh show sys software status Thu Oct 18 14:04:04 2012
```

```
-----  
Sys::Software Status  
Volume Product Version Build Active Status  
-----  
HD1.1 EM 3.2.0 222.0 no installing 6.000 pct  
HD1.2 EM 3.2.0 150.0.465 yes complete  
HD1.3 EM 3.2.0 67.0 no complete
```

Where the "installing 6.000 pct" status increases until it eventually changes to "complete." It changes to a specific failure message if there is an issue.

**OPTIONS**

field-fmt  
Specifies to display the software status for each volume in a field format, rather than in a table.

**SEE ALSO**

show, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express

written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2009-2013, 2016. All rights reserved.

BIG-IP 2016-03-14 sys software status(1)

---

## sys software update-status

**NAME**  
update-status - Displays the BIG-IP(r) update check results.

**MODULE**  
sys software

**SYNTAX**  
Display the results of an update check contained in the update-status component within the sys software module using the syntax in the following section.

**DISPLAY**

list update-status  
options:  
all-properties  
one-line  
[update type] (e.g. RELEASE)

show update-status  
options:  
field-fmt  
[update type] (e.g. RELEASE)

**DESCRIPTION**  
You can use the update-status component to display the results of the update check feature.

**EXAMPLES**

list update-status  
Displays all update check information for the system.

show update-status RELEASE  
Displays update check information for the RELEASE update type for the system in a formatted output.

list update-status GEOLOC all-properties one-line  
Displays all update check information for the GEOLOC update type on one line.

list update-status last-checked-version  
Displays the last checked version for all update types.

**OPTIONS**

app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

available  
This is the file name of the available update.

check-user  
This is the system user that last executed the update check.

label  
This is the label used when displaying the status on the GUI.

last-checked  
This is the last time this update type was checked.

last-checked-auto-mode  
This is false if the last time this update type was checked was performed manually.

last-checked-version  
This is the version found at the last time this update type was checked.

progress-status  
This is the state of the update check.

supplement

This is the file name of the supplemental file.

url This is the URL linking to the available update.

url-supplement

This is a URL linking to a file supplemental to the available update.

For information about the options that you can use with the command list, see help list.

**SEE ALSO**

list, tmsh

**COPYRIGHT**

## sys software update

**NAME**

update - Displays the BIG-IP(r) update check and phone home schedule settings.

**MODULE**

sys software

**SYNTAX**

Display and modify the update component within the sys software module using the syntax in the following section.

**MODIFY**

modify update

options:

auto-check  
auto-phonehome  
frequency

**DISPLAY**

list update

options:

all-properties  
one-line

show update

options:

field-fmt

**DESCRIPTION**

You can use the update component to display or modify the configuration of the update check and phone home feature.

**EXAMPLES**

list update

Displays update check and phone home configuration information for the system.

show update

Displays update check and phone home configuration information for the system formatted for easy viewing.

modify update frequency monthly

Modify the frequency of update checks to monthly.

modify update auto-check disabled

Disable the auto update check feature.

modify update auto-phonehome disabled

Disable the auto phone home feature.

**OPTIONS**

auto-check

Set this to enabled in order to turn on the auto update check feature. disabled turns the feature off.

**auto-phonehome**  
Set this to enabled in order to turn on the auto phone home feature. disabled turns the feature off.

**check-status**  
This read-only field displays the result of the last update check.

**errors**  
This read-only field displays the number of consecutive errors detected by update checking.

**frequency**  
The frequency of update checks can be one of daily, weekly, or monthly.

For information about the options that you can use with the command list, see help list.

BIG-IP 2016-03-14 sys software update(1)

---

## sys software volume

**NAME**

volume - Manages software volumes on the BIG-IP(r) system.

**MODULE**

sys software

**SYNTAX**

Delete, reboot into, or display information about a hard drive volume using the syntax in the following sections.

**REBOOT**

reboot volume [name]

**DISPLAY**

list volume

list volume [ [ [name].[slot\_id] ] | [glob] | [regex] ] ... ]

show running-config

show running-config [ [ [name].[slot\_id] ] | [glob] | [regex] ] ... ]

**options:**

active

active-requested

all-properties

basebuild

build

edition

media [media] [size] [default-boot-location]

one-line

product

status

version

**DELETE**

delete volume [name]

**DESCRIPTION**

You can use the volume component to view information about configured volumes, delete unwanted volumes, and reboot the device to a specific volume.

Volumes are created using the install command. See help sys software image and the option create-volume.

Deleting or rebooting into a volume on a VIPRION system affects the entire chassis; therefore, you do not need to specify the slot number.

**EXAMPLES**

list volume \*/1

Displays the details of all the volumes located on the first slot in a chassis.

delete volume HD1.5

Deletes the volume named HD1.5.

reboot volume HD1.1

Boots into volume HD1.1 if that volume is not already active. If the volume has an image actively being installed on it, the reboot occurs when the installation is complete.

#### OPTIONS

active

Specifies if this volume is being run.

active-requested

Specifies if this volume should be active once its status is complete. The system associates this setting with either the active volume or the volume that is going to become active when its status is complete. If active-requested is set on a volume that is not presently active, the system reboots into the volume when the volume status is complete. As an example, install sys software image BIGIP-10.1.0.3341.0.iso volume HD1.2 reboot will cause active-requested to be set on volume HD1.2, and the system will reboot into volume HD1.2 when the installation is complete. This value is read-only.

basebuild

Displays the build number of either the hotfix presently applied to the system or the original build.

build

Displays the original build number (before any hotfixes).

edition

Displays a textual description of the image. You can use this option to specify the hotfix you want to install.

media

Displays a description of the physical media on which the volume exists. The options are:

media

The type of physical device on which the volume exists, for example, hard drive (hd) or compact flash (cf).

size The space on the slot reserved for the volume.

default-boot-location

Specifies the volume into which the system boots if the slot resets.

name Specifies the name of the volume you are configuring. Volume names are in the format HDX.Y, CFX.Y, or MDX.Y, where X is the hard drive index (HDX), compact flash index (CFX), or RAID index (MDX) (on systems that support RAID), and Y is the volume number on that drive.

product

Displays the F5 Networks product that is installed on the volume.

reboot

Reboots the system into the specified volume.

regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

status

Displays the installation status of the volume. The options are complete or installing.

version

Displays the version number of the software installed on the volume.

# sys sshd

**NAME**  
sshd - Configures the Secure Shell (SSH) daemon for the BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Configure the sshd component within the sys module using the syntax in the following sections.

**MODIFY**

```
modify sshd
options:
  allow [add | delete | replace-all-with] {
    [ [hostname] | [IP address] ] ...
  }
  allow none
  banner [disabled | enabled]
  banner-text [string]
  inactivity-timeout [integer]
  include [string]
  login [disabled | enabled]
  log-level [debug | debug1 | debug2 | debug3 | error | fatal |
            info | quiet | verbose]
  port [integer]
```

**edit sshd**

```
options:
  all-properties
  non-default-properties
```

**DISPLAY**

```
list sshd
list sshd [option]
show running-config sshd
show running-config sshd [option]
options:
  all-properties
  non-default-properties
  one-line
```

**DESCRIPTION**  
You can use the sshd component to configure a secure channel between the BIG-IP system and other devices.

F5 Networks recommends that users of the Configuration utility exit the utility before changes are made to the system using the sshd component. This is because making changes to the system using this component causes a restart of the sshd daemon. Likewise, restarting the sshd daemon creates the necessity for a restart of the Configuration utility.

**EXAMPLES**

```
modify sshd allow add {192.168.0.0/255.255.0.0}
```

Creates an initial range of IP addresses (192.168.0.0 with a netmask of 255.255.0.0) that are allowed to log in to the system.

```
modify sshd allow add {192.168.1.245}
```

Adds the IP address, 192.168.1.245, to the existing list of IP addresses that are allowed to log in to the system.

```
modify sshd login enabled
```

Enables SSH login to the system.

```
modify sshd inactivity-timeout 3600
```

Sets an inactivity timeout of 60 minutes for SSH logins to the system.

```
modify sshd log-level error
```

Sets the sshd message log level to ERROR.

```
modify sshd banner enabled banner-text "NOTICE: Improper use of this
computer may result in prosecution!"
```

Creates a banner that displays when a user attempts to log in to a system using SSH.

Note that you must enclose the banner text in double quotation marks, and then type single quotation marks outside the double quotation marks. You can also use the backslash character to escape each quotation mark as well as any other special characters that the system might process (for example, exclamation point !).

**OPTIONS**

**allow**  
Configures servers in the /etc/hosts.allow file. The default value is all.

**Warning:** Using the value none resets the sshd daemon to allow all servers access to the system. F5 Networks recommends that you do not use the value none with the sshd component.

**banner**  
Enables or disables the display of the banner text field when a

user logs in to the system using SSH. The default value is disabled.

**banner-text**

When the banner option is enabled, specifies the text to include in the banner that displays when a user attempts to log on to the system.

**inactivity-timeout**

Specifies the number of seconds before inactivity causes an SSH session to log out. The default value is 0 (zero) seconds, which indicates that inactivity timeout is disabled.

**include**

Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using the include option. If you use this option incorrectly, you put the functionality of the system at risk.

**login**

Enables or disables SSH logins to the system. The default value is enabled.

**log-level**

Specifies the minimum sshd message level to include in the system log. The possible values are:

**debug - debug3**

Indicates that the minimum sshd message level that the system logs is the specified debugging level of messages.

**error**

Indicates that the minimum sshd message level that the system logs is error.

**fatal**

Indicates that the minimum sshd message level that the system logs is fatal.

**fips-cipher-version**

Indicates if the ciphers have been set to FIPS 140-2 approved ones when the BIG-IP boots up in FIPS 140-2 mode. This is read-only for the user. The default value is 0.

**info** Indicates that the minimum sshd message level that the system logs is informational.

**quiet**

Indicates that the system does not log sshd messages.

**verbose**

Indicates that the system logs all sshd messages.

**port** Specifies the TCP port to run SSHD. It is a number in the range of 1 and 65535.

The default value is 22.

**SEE ALSO**

## sys state-mirroring

**NAME**

state-mirroring - Configures connection mirroring for a BIG-IP(r) system that is part of a redundant pair in a high availability system.

**MODULE**

sys

**SYNTAX**

Configure the state-mirroring component within the sys module using the syntax in the following sections.

**MODIFY**

```
modify state-mirroring
options:
  addr [IP address]
  peer-addr [IP address]
  secondary-addr [IP address]
  secondary-peer-addr [IP address]
  state [enabled | disabled]
```

```
edit state-mirroring
options:
  all-properties
  non-default-properties
```

```
DISPLAY
list state-mirroring
list state-mirroring [option]
show running-config state-mirroring
show running-config state-mirroring [option]
options:
  all-properties
  non-default-properties
  one-line
```

#### DESCRIPTION

You can use this component to configure connection mirroring on a system that is part of a redundant pair in a high availability system.

Connection mirroring is the process of duplicating connections from the active system to the standby system. Enabling this setting ensures a higher level of connection reliability, but it may also have an impact on system performance.

#### EXAMPLES

```
modify state-mirroring state enabled addr 192.168.10.10 peer-addr
192.168.10.20
```

Enables and configures connection mirroring for a high availability system in which one BIG-IP system has an IP address of 192.168.10.10, and its peer has an IP address of 192.168.10.20.

```
modify state-mirroring state enabled
```

Re-enables connection mirroring for a system for which connection mirroring was disabled.

#### OPTIONS

**addr** Specifies the primary self-IP address on this unit to which the peer unit in this redundant pair mirrors its connections. The default value is ::.

**peer-addr** Specifies the primary self-IP address on the peer unit to which this unit mirrors its connections. The default value is ::.

**secondary-addr** Specifies another self-IP address on this unit to which the peer unit mirrors its connections when the primary address is unavailable. The default value is ::.

**secondary-peer-addr** Specifies another self-IP address on the peer unit to which this unit mirrors its connections when the primary peer address is unavailable. The default value is ::.

**state** Enables or disables connection mirroring. The default value is enabled.

## sys sync-sys-files

#### NAME

sync-sys-files - Syncs a pre-defined set of system files from a device.

**MODULE**  
sys

**SYNTAX**  
Sync a pre-defined set of system files within the sys module using the syntax shown in the following sections.

**RUN**  
run sync-sys-files  
options:  
from [IP address]

**DISPLAY**  
show sync-sys-files

**DESCRIPTION**  
You can use the sync-sys-files component to sync system files listed in /usr/share/defaults/sys\_file.spec from a remote device. You can run this command only if the Administrator user role is assigned to your user account.

**EXAMPLES**  
run sync-sys-files from 172.27.34.182

Syncs the list of files (as given in /usr/share/defaults/sys\_file.spec) from the IP address 172.27.34.182.

show sync-sys-files

Shows the last sync time and the source device from where the files are synced.

**OPTIONS**  
from Specifies the IP address used for configuration synchronization on the device from which you want to sync system files.

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

non-default-properties

```

```

DISPLAY
list syslog
list syslog [option]
show running-config syslog
show running-config syslog [option]
options:
all-properties
non-default-properties
one-line

```

#### DESCRIPTION

You can use the syslog component to configure the system log.

#### EXAMPLES

```
modify syslog auth-priv-from warning
```

Resets the lowest level of messages about user authentication that are included in the system log to messages with a level of warning, error, critical, alert, and emergency.

```
modify syslog auth-priv-to warning
```

Resets the highest level of messages about user authentication that are included in the system log to messages with a level of warning, error, critical, alert, and emergency.

#### OPTIONS

**auth-priv-from**  
Specifies the lowest level of messages about user authentication to include in the system log. The default value is notice.

**auth-priv-to**  
Specifies the highest level of messages about user authentication to include in the system log. The default value is emerg.

**cron-from**  
Specifies the lowest level of messages about time-based scheduling to include in the system log. The default value is warning.

**cron-to**  
Specifies the highest level of messages about time-based scheduling to include in the system log. The default value is emerg.

**daemon-from**  
Specifies the lowest level of messages about daemon performance to include in the system log. The default value is notice.

**daemon-to**  
Specifies the highest level of messages about daemon performance to include in the system log. The default value is emerg.

**description**  
User defined description.

**host** Specifies the IP address of a remote server to which syslog sends messages. The default value is none.

**include**  
Warning: Do not use this option without assistance from the F5 Technical Support team. The system does not validate the commands issued using the include options. If you use this option incorrectly, you put the functionality of the system at risk.

**iso-date**  
Enables or disables the ISO date format for messages in the log files. The default value is disabled.

**console-log**  
Enables or disables logging emergency syslog messages to the console. The default value is enabled.

**kern-from**  
Specifies the lowest level of kernel messages to include in the system log. The default value is notice.

**kern-to**  
Specifies the highest level of kernel messages to include in the

system log. The default value is emerg.

**local-ip**

Specifies the IP address of the interface syslog binds with in order to log messages to a remote host. For example, if you want syslog to log messages to a remote host that is connected to a VLAN, you set this parameter to the self IP address of the VLAN.

**local6-from**

Specifies the lowest error level for messages from the local6 facility to include in the log. The default value is notice.

**local6-to**

Specifies the highest error level for messages from the local6 facility to include in the log. The default value is emerg.

**mail-from**

Specifies the lowest level of mail log messages to include in the system log. The default value is notice.

**mail-to**

Specifies the highest level of mail log messages to include in the system log. The default value is emerg.

**messages-from**

Specifies the lowest level of messages about user authentication to include in the system log. The default value is notice.

**messages-to**

Specifies the highest level of system messages to include in the system log. The default value is warning.

**remote-port**

Specifies the port number of a remote server to which syslog sends messages. The default value is 514.

**remote-servers**

Configures the remote servers, identified by IP address, to which syslog sends messages. The default value is none.

**user-log-from**

Specifies the lowest level of user account messages to include in the system log. The default value is notice.

**user-log-to**

Specifies the highest level of user account messages to include in the system log. The default value is emerg.

**SEE ALSO**

## sys tmm-info

**NAME**

tmm-info - Displays information about the Traffic Management Microkernel (tmm) daemon.

**MODULE**

sys

**SYNTAX**

Display statistics for the tmm-info component within the sys module using the syntax in the following section.

**DISPLAY**

show tmm-info

**options:**

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
global

**DESCRIPTION**

You can use the tmm-info component to display information about the tmm daemon. The purpose of this daemon is to direct all application traffic passing through the BIG-IP(r) system.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

**SEE ALSO**

show, sys tmm-traffic, tmsh

**COPYRIGHT**

BIG-IP 2011-04-25 sys tmm-info(1)

---

## sys tmm-traffic

**NAME**

tmm-traffic - Displays Traffic Management Microkernel (tmm) statistics.

**MODULE**

sys

**SYNTAX**

Configure the tmm-traffic component within the sys module using the syntax in the following section.

**MODIFY**

reset-stats tmm-traffic

**DISPLAY**

show tmm-traffic

**options:**

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
global

**DESCRIPTION**

You can use the tmm-traffic component to display tmm traffic statistics, including errors and redirected connections. The purpose of this daemon is to direct all application traffic passing through the BIG-IP(r) system.

**OPTIONS**

For information about the options that you can use with the command show, see help show.

For information about the options that you can use with the command reset-stats, see help reset-stats.

## SYS UCS

#### NAME

ucs - Loads or saves a UCS (.ucs) file.

#### MODULE

sys

#### SYNTAX

Configure the ucs component within the sys module using the syntax in the following sections.

#### MODIFY

save ucs [file name]

#### options:

no-private-key  
passphrase

load ucs [file name]

#### options:

include-chassis-level-config  
no-license  
no-platform-check  
passphrase  
platform-migrate  
reset-trust

delete ucs [ file name ]

#### DISPLAY

list ucs

show ucs [file name]

#### DESCRIPTION

You can use the ucs component to save the running configuration of the system into a UCS file. Additionally, you can modify the running configuration of the system by loading an existing UCS file.

When you save a UCS file, the file is saved to the default directory, /var/local/ucs.

When you load a UCS file in shell mode, the system searches for the file using the relative path to the default directory (/var/local/ucs). When you load a UCS file in bash mode, the system searches the current directory first. If the file is not found in the current directory, the default directory is then searched.

## EXAMPLES

save ucs myucs

Saves the running configuration of the system into the file myucs.ucs.

load ucs myucs

Modifies the running configuration of the system by loading the configuration contained in the myucs.ucs file.

delete ucs myucs

Delete myucs.ucs in the default directory, /var/local/ucs/.

list ucs

Displays existing UCS files in the default directory, /var/local/ucs/.

## OPTIONS

include-chassis-level-config

During restore of the UCS file, include chassis level configuration that is shared among boot volume sets. For example, cluster default configuration.

no-license

Performs a full restore of the UCS file and all the files it contains, with the exception of the license file. The option must be used to restore a UCS on RMA devices (Returned Materials Authorization).

no-platform-check

Bypasses the platform check and allows a UCS that was created using a different platform to be installed. By default (without this option), a UCS created from a different platform is not allowed to be installed.

no-private-key

Indicates that the UCS file can be saved without private key information.

passphrase

Specifies the passphrase that is necessary to load the specified UCS file.

platform-migrate

Ignore the configuration items specific to a particular platform. The platform-specific objects already present on the device are not removed or modified. The ones included in the UCS archive are not loaded.

This option is not valid for UCS archives from systems provisioned with modules other than LTM and GTM. If the UCS comes from a system running any release of TMOS version 10, only LTM (not GTM) is supported.

This option implies no-license and no-platform-check.

reset-trust

When specified, the device and trust domain certs and keys are not loaded from the UCS. Instead, a new set is regenerated.

## SEE ALSO

## sys url-db download-result

### NAME

download-result - Lists download result for URL Master and RTSU DB.

### MODULE

sys url-db

### SYNTAX

List download-result component within the module using the

syntax shown in the following sections.

#### DISPLAY

The download-result consists of the object name (/Common/masterdb or /Common/rtsudb), and version. These objects are created by BIGIP and cannot be modified or deleted.

```
list url-db download-result [masterdb | rtsudb]
```

#### options:

- all-properties
- non-default-properties
- one-line

```
list url-db download-result masterdb
```

- db-version [integer]
- ret-code 0

```
list url-db download-result rtsudb
```

- db-version [integer]
- ret-code 0

#### DESCRIPTION

Lists download result for Master URL database and Real-Time Security Update (RTSU). These objects are created after the first successful download and updated after every download.

#### OPTIONS

db-version

Specifies database version for URL Master or Real-Time Security Update DB.

ret-code

Specifies the download result status and always zero now.

#### SEE ALSO

sys url-db download-schedule sys url-db url-category

#### COPYRIGHT

## sys url-db download-schedule

#### NAME

download-schedule - Configures download schedule for URL Master DB.

#### MODULE

sys url-db

#### SYNTAX

Configure a download-schedule component within the module using the syntax shown in the following sections.

#### MODIFY

The download-schedule consists of the object name (/Common/urldb), download start time (start-time), download end time (end-time) and status. You can have only one download schedule and the download occurs daily.

```
modify url-db download-schedule urldb
```

- start-time [HH:MM]
- end-time [HH:MM]
- download-now [true | false]
- status [true | false]
- use-proxy [true | false]

#### DISPLAY

```
list url-db download-schedule urldb
```

#### options:

- all-properties
- non-default-properties
- one-line

#### DESCRIPTION

Configures download schedule for Master URL database.

#### EXAMPLES

```
modify download-schedule urldb { start-time 2:00 end-time 4:00 }
```

Modify the download schedule for Master DB download schedule between 2:00 AM and 4:00 AM. Other downloads such as RTSU (Real-Time Security Update) and ACE (Advanced Classification Engine) DB download occurs at regular intervals.

```
modify download-schedule urlldb { start-time 20:00 end-time 22:00 }
```

Modify the download schedule for Master DB download schedule between 8:00 PM and 10:00 AM.

```
modify download-schedule urlldb { download-now true }
```

Master DB Download starts in few minutes after issuing this command. The download-now will be set to false after successful download.

```
modify download-schedule urlldb { status false }
```

By setting the status flag to false, download (Master and other DB) will not occur any more.

```
modify download-schedule urlldb { use-proxy true }
```

DB Download uses proxy configuration after issuing this command.

#### OPTIONS

##### download-now

Specifies to start download in few minutes and no need to wait for the scheduled window.

##### end-time

Shows download end time. Download will start between scheduled start time and end time.

##### start-time

Shows download start time. Download will start between scheduled start time and end time.

##### status

Shows the download status is enabled. By turning to false, download will not occur.

##### use-proxy

Specifies to use proxy configuration for database download.

## sys url-db url-category

#### NAME

url-category - Configures URL categories for URL classification and filtering

#### MODULE

sys url-db

#### SYNTAX

Configure a url-category component within the module using the syntax shown in the following sections.

#### CREATE/MODIFY

Each url-category consists of the object name (/Common/Business\_and\_Economy), a display-name ("Business and Economy") which is a more user-friendly category name, and a category number. The hundreds and thousands of URLs under a url-category are stored in a database. You can create your own url-category (custom category) and you can add more URLs to an existing category (recategorization).

```
create url-db url-category [name]
options:
  display-name [string]
  description [string]
  initial-disposition [integer]
  is-security-category [string]
  parent-cat-number [integer]
```

```

    severity-level [integer]
    urls [add | delete | modify | replace-all-with] {
[string]
    }
modify url-db url-category [name]
    initial-disposition [integer]
    is-security-category [string]
    parent-cat-number [integer]
    severity-level [integer]
    urls [add | delete | modify | replace-all-with] {
[string]
    }

DISPLAY
list url-category
list url-category [ [ [name] | [glob] | [regex] ] ... ]
    options:
        all-properties
        non-default-properties
        one-line
        partition
DESCRIPTION
    Configures a url-category

NOTE: When you create a new url-category, you must provide a display-
name. However, after creation it cannot be changed to another value.
The system will provide a cat-number for your newly created url-
category. The number is an integer greater than 1900. The url-category
you create is considered to be a custom URL category, and so the is-
custom flag will be set to true.

NOTE: The only change you can make to a system provided url-category is
to add one or more URLs to its list of URLs. This is called
recategorization, and the is-recategory flag will be set to true. You
need to do this if the URL does not already exist in the database.

EXAMPLES
create url-category my-own-url-cat display-name "My Own URL Category"
urls add { http://a.url.com http://www.another.url.org }

Creates a new url-category. The new url-category you create is known as
a custom category, as opposed to a system provided url-category. In
this case, you must specify the display-name and at least one URL.

modify url-category my-own-url initial-disposition 4 parent-category 0

Modify the initial-disposition and parent-category in a customized url-
category.

modify url-category Business_and_Economy urls add {
http://www.theneomaxist.com` }

Modify a system provided url-category by adding a URL to it. This
action is called recategorization. The url-category is recategorized.

OPTIONS
    cat-number
Shows a unique category number. Custom URL categories have numbers
greater than 1900. This is a read-only attribute.

    description
Specifies a unique description for the URL category.

    display-name
Specifies a user-friendly name that describes what the URL
category represents. This attribute cannot be changed after
creation.

    initial-disposition
Specifies the action to be taken when a certain URL category is
not listed in any url-filter.

    is-custom
This flag is set by the system when you create your own URL
category. This attribute is read-only.

    is-security-category
This flag is not being used. This attribute is read-only.

    parent-cat-number
Specifies the category number of a parent url-category. 0 denotes
no parent.

    severity-level
Specifies the severity level.

## sys version

**NAME**  
version - Displays software version information for the BIG-IP(r) system.

**MODULE**  
sys

**SYNTAX**  
Display statistics for the version component within the sys module using the syntax in the following section.

**DISPLAY**  
show version  
options:  
detail

**DESCRIPTION**  
You can use the version component to display the software version running on the system, including a list of hotfixes that you have applied to the system.

**EXAMPLES**  
show version  
  
Displays software version information.  
  
show version detail  
  
Displays more extensive software version information about the system, including the operating system kernel information, and details about each hotfix that you have applied to the system.

**OPTIONS**  
For information about the options that you can use with the command show, see help show.

**SEE ALSO**  
show, tmsh

## util

### util ccmode

**NAME**  
ccmode - set Common Criteria mode and a subset of configuration defaults required for a Common-Criteria-compliant BIGIP system.

**MODULE**  
util

**SYNTAX**  
ccmode

**DESCRIPTION**  
Use this command to set a subset of defaults that are required for a Common-Criteria-compliant system.

Run this command ONLY if you are creating a Common-Criteria-compliant BIG-IP system, or have otherwise determined that all of the changes are desirable for your BIG-IP configuration. Note that there are runtime changes triggered by this command.

Running the ccmode command is an essential part of the configuration changes required to configure a BIG-IP system as Common-Criteria-compliant. This command changes the base configuration in several ways, including:

- o defining the minimum required password policy
- o defining the allowed cipher sets for SSL/TLS
- o disabling some features excluded from the evaluation and therefore not permitted to be used in a compliant system
- o setting several DB variables, including the Security.CommonCriteria variable, an indicator from which other runtime changes are triggered.

While running this script is essential to creating a Common-Criteria-compliant system, it is not sufficient. Customers wishing to configure compliant systems must consult the configuration Guidance documentation provided when the evaluation is complete, and follow its instructions to completely configure the BIG-IP.

This command has no facility for "undoing" the changes it makes. Instead, the administrator must reverse or revise all of the individual commands, reset the DB variables to their defaults, save the new configuration, and restart the BIG-IP.

## util diadb

**NAME**  
diadb - Run the diadb command to display, filter or delete dia persistence entries.

**MODULE**  
util

**SYNTAX**  
run util diadb

---

## util dnatutil

**NAME**  
dnat - command providing reverse and forward mapping for deterministic NAT (DNAT)

**MODULE**  
util

**SYNTAX**  
Run the dnat utility from within the util module using the following syntax:  
  
run util dnat [] [  
[:]]

**DESCRIPTION**  
The dnat utility allows the calculation of forward and reverse source address and port mapping for the deterministic mode of Large Scale NAT.

**EXAMPLES**  
*dnat 10.0.0.1 --action forward Shows a list of translation address/port pairs that might be used for a subscriber at 10.0.0.1, using the DNAT states contained in /var/log/ltn.*  
  
*dnat 173.240.102.139:5678 Performs a reverse mapping back to the subscriber address for the connection from 173.240.102.139:5678, using the DNAT states contained in /var/log/ltn.*  
  
*dnat --start\_time '2012-09-27 06:30:00' --end\_time '2012-09-27 12:10:00' 173.240.102.139:5678 Same as the previous example, but only shows the subscriber addresses that used the translation within the specified time range.*  
  
*dnat --start\_time '2012-09-27 06:30:00' --end\_time '2012-09-27 12:10:00' --file /var/log/test 173.240.102.139:5678 Same as the previous example, but use the DNAT states contained in /var/log/test*  
  
*dnat --file /var/log/test Shows summary information, using the DNAT states contained in /var/log/test*  
  
*dnat --action summary --start\_time '2012-09-27 06:30:00' --end\_time '2012-09-27 12:10:00' Shows summary information, using the DNAT states within the specified time range.*

**OPTIONS**  
*client\_addr or --client\_addr*  
Used to provide the subscriber address for forward mappings (--action forward), and the translation address for reverse mappings (--action reverse).  
  
*client\_port or --client\_port*  
Used to provide the subscriber port for forward mappings (--action forward), and the translation port for reverse mappings (--action reverse).  
  
*end\_time or --end\_time*  
End time of search range. User can specify the time format via the --time-format switch. The time format defaults to 'YYYY-MM-DD HH:MM:SS.'  
  
*start\_time or --start\_time*  
Start time of search range. User can specify the time format via the --time-format switch. The time format defaults to 'YYYY-MM-DD HH:MM:SS.'  
  
*--action*  
Specify the action to be taken: summary, forward, reverse, reverse\_addr. Default: reverse when supplied with client\_addr, summary otherwise.  
  
*summary*  
Provides summary information on the parsed deterministic NAT configuration snippet.

**reverse**

Returns possible subscriber address for the provided client address and client port (as translation end-point).

**forward**

Returns possible translation end-points for the provided client address (as subscriber address).

**forward\_compact**

Returns possible subscriber addresses for the provided client address (as translation address), in a compact format with address and port-range.

**reverse\_addr**

Returns possible subscriber addresses for the provided client address (as translation address).

**--file /var/log/ltn**

Read DNAT state from file (default: /var/log/ltn)

**--time format**

Timestamp parse format for --start time or --end time (default: '%F %T %Z', this yields 'YYYY-MM-DD HH:MM:SS', with timezone being optional.)

**--flags**

DAGLIB flags parameter.

**--flags\_v2or**

DAGLIB flags override parameter, apply when deterministic NAT state is from log version 2 or lower only.

**--all**

Display all entries, even if there are duplicates (default disabled).

**--version**

Display version and DAG information.

**SEE ALSO**

run, tmsh, date

## util finalize custom ami

**NAME**

finalize-custom-ami - Utility to clean-up and prepare the custom AMI for Autoscaling on AWS.

**MODULE**

util

**SYNTAX**

Run the finalize-custom-ami utility from within the util module using the following syntax:

run util finalize-custom-ami

**DESCRIPTION**

The finalize-custom-ami utility runs the final clean-up steps to prepare the instance for being packaged as a custom AMI that could be autoscaled in AWS. This is a BIG-IP VE on AWS specific utility tool that shouldn't be run on other platforms. This should be used according to supporting documentation provided by F5.

All the output is reported on standard output.

**EXAMPLES**

run util finalize-custom-ami

**SEE ALSO**

run, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or

by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## util ihealth

**NAME**  
ihealth - Run the ihealth utility for the purpose of uploading a new or existent qkview file to ihealth.

**MODULE**  
util

**SYNTAX**  
run util ihealth [ -f ] [ -e ] [ -u ] [ -p ] [ -s ] [ -d ] [ -n ] [ -h ] [ -C ] [ -x ]

or

run util ihealth [ --file= ] [ --existing= ] [ --user= ] [ --password= ] [ --sr= ] [ --description= ] [ --no-upload ]

**DESCRIPTION**  
The ihealth utility runs a menu that allows users to select qkview files or creating a new qkview file for uploading to ihealth using DevCentral userid.

**OPTIONS**

- file**  
This is the name of the local diagnostics file to use or create.
- existing**  
This flag can be used to specify to use an existing diagnostics file, rather than create one.
- user**  
This is an over-ride of the DevCentral user name stored for connecting to the iHealth diagnostic service.
- password**  
This is an over-ride of the DevCentral password stored for connecting to the iHealth diagnostic service.
- description**  
This is a description that is attached to the diagnostics file when uploaded to the iHealth diagnostic service.
- sr** This is a service request number that is attached to the diagnostics file when uploaded to the iHealth diagnostic service.
- exclude**  
This is an over-ride of the stored exclude settings for limiting files collected by qkview. See qkview for the possible values.
- exclude-cores**  
This directs qkview to exclude core files from it's data collection.
- no-upload**  
This directs the iHealth command to skip uploading to the iHealth service.
- help**  
Displays the usage for this command.

**SEE ALSO**  
run, tmsh, qkview

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## util ipsecalgdb

**NAME**  
ipsecalgdb - Run the ipsecalgdb command to view IPsecALG translation, and pending IKE connection count entries.

**MODULE**  
util

**SYNTAX**  
run util ipsecalgdb  
Commands:  
delete  
list

**Objects:**  
all  
tran[slation] entries  
pend[ing] IKE connection count entries

**DESCRIPTION**  
The ipsecalgdb utility allows users to view IPsecALG translation, and pending IKE connection count entries, as well as deleting those entries using this utility.

**EXAMPLES**  
run util ipsecalgdb delete all  
  
Delete all IPsecALG translation, and pending IKE connection count entries.  
  
run util ipsecalgdb delete trans  
  
Delete all IPsecALG translation entries.  
  
run util ipsecalgdb delete pend  
  
Delete all IPsecALG pending IKE connection count entries.  
  
run util ipsecalgdb list all  
  
Shows all IPsecALG translation, as well as pending IKE connection count entries.

**OPTIONS**  
delete  
Delete all objects of the specified type.  
  
list Display all objects of the specified type.  
  
all = all available object types.  
trans = IPsecALG translation entries.  
pend = IPsecALG pending IKE connection count entries.

**SEE ALSO**  
run, tmsh

**COPYRIGHT**

## util lsndb

**NAME**  
lsndb - Run the lsndb command to view Large Scale NAT persistence entries, inbound mappings, client connection counts, and PCP mappings.

**MODULE**

util

**SYNTAX**

run util lsndb  
Commands:  
del[ete]  
list  
summary

**Objects:**

all  
client  
inbound[-mapping]  
pba  
pcp  
filters  
persist[ence]  
all

**DESCRIPTION**

The lsndb utility allows users to view LSN persistence mappings, inbound mappings, PCP mappings, client connection counts and port block entries. Persistence, inbound and PCP mappings can also be deleted using this utility.

**EXAMPLES**

run util lsndb delete all

Delete all LSN persistence mappings, inbound mappings and PCP mappings.

run util lsndb del inbound

Delete all LSN inbound mappings.

run util lsndb delete pcp

Delete all PCP mappings.

run util lsndb delete persist

Delete all LSN persistence entries.

run util lsndb list all

Shows all LSN persistence mappings, inbound mappings, PCP mappings, client connection counts and port block entries.

run util lsndb list client

Shows all LSN client connection counts. Each line will display the client IP address and the number of connections used by the client. Connection counts are only available for LSN pools with a non-zero client connection limit.

run util lsndb list inbound

Shows all LSN inbound mappings. Each line will display the translation IP address, the client IP address, the DS-Lite tunnel (if configured) and the age of the mapping.

run util lsndb list pba

Shows all LSN port block entries. Each line will display the client IP address, the port block used and the time that the entry will persist in the database (TTL).

run util lsndb list pcp

Shows all PCP mappings. PCP clients send MAP requests to map their private IP address and port to a public IP address and port. The BIG IP system uses those mappings as NAT entries. Each line will display the client IP address, the external address used and the age of the mapping.

run util lsndb list filters

Shows all LSN filters for inbound mappings. Each line will display the inbound mappings along with filter's remote peer IP address and prefix length.

run util lsndb list persist

Shows all LSN persistence entries. Each line will display the client IP address, the translation address used and the time that the entry will persist in the database (TTL).

run util lsndb summary all

Show summary for all LSN persistence mappings, inbound mappings and port block entries.

run util lsndb summary inbound

Show summary for all LSN inbound mapping entries.

run util lsndb summary pba

Show summary for all LSN port block entries.

run util lsndb summary persist

Show summary for all LSN persistence entries.

**OPTIONS**

**delete**  
Delete all objects of the specified type. Client connection counts and port block entries cannot be deleted.

**list** Display all objects of the specified type.

**summary**  
Display summary information of the specified type.

Object types are:

all = all available object types.  
client = LSN client counts (list only).  
inbound = LSN inbound mapping entries.  
pba = LSN port block entries.  
pcp = PCP mappings entries.  
persist = LSN translation persist entries.

## util platform check

NAME

platform\_check - Runs platform checks available on an active system

MODULE

util

SYNTAX

Run the platform\_check utility from within the util module using the following syntax:

```
run util platform_check
```

DESCRIPTION

The platform\_check utility runs diagnostics available on an active system to verify correct functionality of platform components. This should be used according to supporting documentation provided by F5.

Output is provided on standard output as well as /var/log/platform\_check. Running platform\_check with the -h argument will produce available argument listing. Running platform\_check with the -l argument will list the available test suites.

EXAMPLES

```
run util platform_check
```

Runs all diagnostics available for an active system.

```
run util platform_check drive
```

Runs only the drive suite of diagnostics.

SEE ALSO

run, tmsh

## util platform diag

**NAME**  
platform\_diag - Runs platform diagnostics available on an inactive system

**MODULE**  
util

**SYNTAX**  
Run the platform\_diag utility from within the util module using the following syntax:  
  
run util platform\_diag

**DESCRIPTION**  
The platform\_diag utility runs the diagnostics on an inactive system to verify correct functionality of platform components. This should not be used on an active system. This should be used according to supporting documentation provided by F5.  
  
Output is provided on standard output as well as /var/log/platform\_diag. Running platform\_diag with the -h argument will produce available argument listing. Running platform\_diag with the -l argument will list the available test suites.

**EXAMPLES**  
run util platform\_diag  
  
Runs all appropriate diagnostics for this platform.  
  
run util platform\_diag hwaccel  
  
Runs only the hwaccel suite of diagnostics.

**SEE ALSO**

**NAME**  
sipdb - Run the sipdb command to view SIP persistence entries.

**MODULE**  
util

**SYNTAX**  
run util sipdb

---

## util ssh keyswap

**NAME**  
ssh-keyswap - Run the ssh-keyswap command to manage SSH keys on the BIG-IP.

**MODULE**  
util

**SYNTAX**  
run util ssh-keyswap

---

## util test-monitor

**NAME**  
test-monitor - Runs an external monitor and displays the inputs to and output from the monitor.

**MODULE**  
util

**SYNTAX**  
Run the test-monitor utility from within the util module using the following syntax:  
  
run util test-monitor address port

**DESCRIPTION**  
The test-monitor utility runs a single instance of a monitor against the specified ip-address:port. The utility output shows the environment, command-line arguments, and resulting messages on stdout and stderr.  
  
Internal monitors are not supported.

**EXAMPLES**  
run util test-monitor monitorA address 10.10.10.4 port 80  
Runs a monitor on the IP address 10.10.10.4 and port 80.

**SEE ALSO**  
run, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any

## util verify encryption

**NAME**  
verify-encryption - Runs the encrypted attributes diagnostics utility

**MODULE**  
util

**SYNTAX**  
Run the verify-encryption utility from within the util module using the following syntax:  
run util verify-encryption  
run util verify-encryption

**DESCRIPTION**  
The verify-encryption runs the /usr/sbin/lssa utility that diagnoses issues with encrypted attributes.  
  
When running this utility, it looks through the files /config/bigip.conf, /config/bigip\_base.conf, /config/profile\_base.conf, /config/bigip\_user.conf and returns lines that match the regular expression of keys, but can't actually be decrypted by the master key. Optionally, a file list can be provided as parameters. Only the specified files will be searched in this case.

**EXAMPLES**  
run util verify-encryption  
  
Runs the lssa utility for the files /config/bigip.conf, /config/bigip\_base.conf, /config/profile\_base.conf, /config/bigip\_user.conf.  
  
run util verify-encryption /config/partitions/partA/bigip.conf /config/partitions/partB/bigip.conf  
  
Runs the lssa utility for the space separated file-list.

**SEE ALSO**  
run, tmsh

## vcmp

### vcmp global

**NAME**  
global - Display global vCMP system statistics.

**MODULE**  
vcmp

**SYNTAX**  
Configure the global component within the vcmp module using the following syntax.

**DISPLAY**  
show global  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
Use the global component within the vcmp module to display high-level vCMP system statistics on a per-slot basis. These are statistics that are not associated with any particular vCMP guest or virtual-disk.

**EXAMPLES**  
show vcmp global  
  
Display all global vCMP system statistics.

**OPTIONS**  
For information about the options that you can use with the show command, see help show.

**SEE ALSO**  
tmsh, show, vcmp guest, vcmp virtual-disk

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## vcmp guest

**NAME**  
guest - Configures a cluster of virtual machines (VMs) that run on one or all slots. This cluster is known as a vCMP guest.

**MODULE**  
vcmp

**SYNTAX**  
Configure the guest component within the vcmp module using the syntax in the following sections.

**CREATE**  
create guest [name]  
modify guest [name]  
options:  
  hostname [hostname]  
  app-service [[string] | none]  
  initial-hotfix [hotfix-filename]  
  initial-image [image-filename]  
  management-gw [ip-address]  
  management-ip [ip-address/netmask | ip-address/prefixlen]  
  management-network [bridged | isolated]  
  slots [integer]  
  traffic-profile [vcmp-traffic-profile-name]  
  min-slots [integer]  
  allowed-slots {  
  [slot ID] ...  
  }  
  cores-per-slot [integer]  
  state [configured | provisioned | deployed]  
  virtual-disk [filename]  
  vlans [add | delete | replace-all-with] {  
  [VLAN name] ...  
  }  
  capabilities [add | delete | modify | replace-all-with] {  
  [capability Id] [ { value [integer] } ]  
  }  
}

**DISPLAY**  
list guest  
show guest  
  
options:  
  all-properties  
  status

**DELETE**  
delete guest [name]

## DESCRIPTION

Manage vCMP guests running on this host.

## EXAMPLES

```
list vcmp guest
```

Lists the current configuration of all guests.

```
show vcmp guest
```

Displays detailed information regarding the state and progress of all guests.

```
show vcmp guest status
```

Displays the running state of all guests, including each guest's prompt status.

```
show vcmp guest all-properties
```

Displays greater detailed statistics and information on all guests.

```
create vcmp guest my_guest slots 4 min-slots 2 management-ip  
192.168.45.12/24 management-gw 192.168.45.254 initial-image  
BIGIP-11.0.0.2400.0.iso
```

Creates a guest that should span four slots, but must span at least two, with the given management IP and gateway, and with the image file BIGIP-11.0.0.2400.0.iso, which is used to install TMOS on the guest's virtual disks. By default, this guest is in the configured state and has a management network in Bridged mode.

```
modify vcmp guest my_guest state provisioned
```

Moves the guest into the provisioned state, which causes the host to assign the guest to slots, allocate hardware resources to the guest from those slots, and create virtual disks for the guests on those slots.

Moves the guest into the deployed state, which causes the host to start and maintain VMs on each slot that the guest has been assigned to.

```
modify vcmp guest my_guest state configured
```

Moves the guest back to the configured state, which causes all of its VMs to shut down and the hardware to be deallocated. The guest is unassigned from all slots. The guest's virtual disks will remain on the host.

```
modify vcmp guest my_guest traffic-profile fiftyMbpsSLAProfile
```

Adds a traffic-profile named fiftyMbpsSLAProfile to the guest in question, which is configured under vcmp traffic-profile.

## OPTIONS

**app-service**

Specifies the name of the application service to which the guest belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the guest. Only the application service can modify or delete the guest.

**hostname**

Assigns the specified host name to the guest. The host name must be a FQDN. If none is given, the default of ".localdomain" is used. If the guest's name contains characters that are not allowed in a FQDN, then "localhost.localdomain" is used.

This is only a suggested value and may be changed on the guest itself. If the guest ever reverts to the default host name, this suggested host name is used instead of the normal system default.

**initial-hotfix**

Specifies which hotfix image to install on newly created virtual disks for this guest. This image is only used when initially creating the virtual disks. After initial creation, the typical live-install process should be used on the guest to manage software upgrades. The image filename must match a verified software image file that exists in the /shared/images directory, otherwise the guest will sit in a wait state on any slot that is missing the hotfix image until that image is added.

This field is required if the guest state is provisioned or deployed, otherwise it can be left blank.

**initial-image**

Specifies which software image to install on newly created virtual disks for this guest. This image is only used when initially creating the virtual disks. After initial creation, the typical live-install process should be used on the guest to manage software upgrades. The image filename must match a verified software image file that exists in the /shared/images directory, otherwise the guest will sit in a wait state on any slot that is missing the software image until that image is added.

This field is required if the guest state is provisioned or deployed, otherwise it can be left blank.

**management-gw**

Specifies the IP address of the default gateway for the management

network. This IP address is only a suggested value and can be changed on the guest itself. If the guest ever reverts to the default management gateway, the suggested gateway is used instead of the normal system default.

This field is required if the guest's management-network is bridged, otherwise it can be left blank.

#### management-ip

Specifies the management IP address and netmask to assign to the guest. This address floats to the primary slot of the guest.

This is only a suggested value and can be changed on the guest itself. If the guest ever reverts to the default management IP address, the suggested IP address is used instead of the normal system default.

This field is required if the guest's management-network is bridged, otherwise it can be left blank.

#### management-network

Specifies the management network mode for this guest. When in Bridged mode, the management interfaces on the guest's VMs are bridged to the physical management interfaces on the host blades. This enables the guest to communicate with networks attached to these physical interfaces, the host itself, and other guests in Bridged mode.

In Isolated mode, the management interfaces of the guest's VMs are completely disconnected. The only way to manage such a guest is by connecting to the console on each of the guest's VMs by using the /usr/bin/vconsole utility or by connecting through a configured self IP on a guest's VLAN.

The default value is Bridged.

#### ssl-mode

Specifies the SSL mode for this guest. When in shared mode the guest shares the available non-dedicated ssl resources with other guests that are in shared mode. when in dedicated mode the guest receives dedicated SSL hardware resources proportional to number of vcpu cores. When in none mode the guest receives no hardware ssl resources. The default value is shared.

#### slots

Specifies the number of slots to which this guest should be assigned. This number must be greater than zero and no bigger than the cluster size. The host will attempt to assign the guest up to this number of slots.

Note that this property can be changed while the guest is in any state. While in the configured state, modifying the slots property has no effect, since the guest has not yet been assigned to any slots. While in the provisioned state, decreasing this field will cause the guest to be unassigned from enough slots to honor the new value. The host will unassign the guest first from slots that have the most allocated resources. When a guest's slots value is increased, the host attempts to assign the guest to as many slots as possible, up to the new slots value. This same behavior occurs when modifying the property while the guest is in the deployed state, except that running VMs are shut down on any slots that the guest is unassigned from, and new VMs are deployed on any slots to which the guest has been newly assigned.

The default value is 1.

#### traffic-profile

Specifies a traffic-profile to be used in defining characteristics of traffic which transits the guest's data-plane. For instance a traffic-profile with a color-policer on it that limits the network throughput of the guest may be applied to enforce service agreements between a host admin and a guest user, or to help mitigate network level DOS of other guests in the system.

#### min-slots

This field dictates the number of slots that the guest must be assigned to. If at the end of any allocation attempt the guest is not assigned to at least this many slots, the attempt fails and the change that initiated it is reverted. A guest's min-slots value cannot be greater than its slots value.

The default value is 1.

#### allowed-slots

This list contains those slots that the guest is allowed to be assigned to. When the host determines which slots this guest should be assigned to, only slots in this list will be considered. This is a good way to force guests to be assigned only to particular slots, or, by configuring disjoint allowed-slots lists on two guests, that those guests are never assigned to the same slot.

By default this list includes every available slot in the cluster. This means by default the guest is allowed to be assigned to any slot.

#### cores-per-slot

This value dictates how many cores a guest is allocated from each slot that it is assigned to. Possible values are dependent on the type of blades being used in this cluster. Use tab-completion to see a list of possible values on the current system.

The default cores-per-slot value depends on the type of blades being used in this cluster.

#### state

Guests are put into the configured state by default. In this state, the configuration for the guest exists on the host, but none of the guest's VMs are running and no hardware resources (for example: CPU cores, memory) are allocated to it. When the guest moves to the provisioned state, hardware resources are allocated to it, and if not already present, virtual disks are created, and the initial-image is installed onto them. In the deployed state, the vcmpd daemon on the host blades use the allocated resources to launch the VMs. Note that moving from the configured state to the deployed state implies the actions that occur in the provisioned state. To shut down a guest's VMs without de-allocating its hardware resources, move the guest from the deployed state to the provisioned state. Moving a guest to the configured state causes its hardware resources to be deallocated. This does not cause the guest's virtual disks to be deleted. They persist on disk and are reused when the vCMP moves back to the provisioned/deployed states.

#### virtual-disk

Specifies the filename of the virtual disk to use for this guest's VMs. If the filename does not end in .img, it is appended. When the guest moves to a state in which virtual disks need to be provisioned (provisioned or deployed), a new virtual disk image will be created for the guest with this given filename on each slot that the guest is assigned to and does not already have a virtual disk image. The initial-image is used when creating and installing new virtual disk images. If this field is left blank when virtual disk images need to be provisioned for this guest, a default value of ".img" is assigned. If a virtual disk by that name already exists, then an error is thrown. This prevents virtual disks from accidentally being reused by this assigning of default virtual disk filenames.

#### capabilities

This list contains the various capability flags and an optional value associated with the guest. The possible capability flags are: appliance-mode, stats-isolated-mode, and host-software-only-mode. The value attributes for these capability flags are currently ignored and may be omitted. The capabilities may be added or removed from a vCMP guest in any state.

The appliance-mode capability disables root and bash access to the guest.

The stats-isolated-mode capability prevents some guest statistics from being sent to the hypervisor.

The host-software-only-mode capability prevents the guest from installing images and hotfixes other than those provided by the hypervisor.

## vcmp health ha-status

#### NAME

ha-status - Display vCMP guest high availability (HA) status.

#### MODULE

vcmp health

#### SYNTAX

Display guest HA status using the following syntax.

#### DISPLAY

show ha-status

#### DESCRIPTION

Use the ha-status component within the vcmp health module to display HA status information about the vCMP guests deployed on this system. This is similar to running tmsh show sys ha-status inside of a guest.

#### EXAMPLES

```
show vcmp health ha-status
```

Display HA status status for all guests.

```
show vcmp health ha-status my_guest
```

Display HA status status for a single guest; "my\_guest".

#### OPTIONS

For information about the options that you can use with the show command, see help show.

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

---

## vcmp health module-provision

#### NAME

module-provision - Display vCMP guest module provisioning status.

#### MODULE

vcmp health

#### SYNTAX

Display guest module provisioning status using the following syntax.

##### DISPLAY

```
show module-provision
```

#### DESCRIPTION

Use the module-provision component within the vcmp health module to display module provisioning status information about the vCMP guests deployed on this system. This will show you which modules are provisioned in a guest and at what level.

#### EXAMPLES

```
show vcmp health module-provision
```

Display module provisioning status for all guests.

```
show vcmp health module-provision my_guest
```

Display module provisioning status for a single guest; "my\_guest".

#### OPTIONS

For information about the options that you can use with the show command, see help show.

#### COPYRIGHT

BIG-IP 2015-11-05 vcmp health module-provision(1)

---

## vcmp health prompt

**NAME**  
prompt - Display vCMP guest prompt status.

**MODULE**  
vcmp health

**SYNTAX**  
Display guest prompt status using the following syntax.

**DISPLAY**  
show prompt

**DESCRIPTION**  
Use the prompt component within the vcmp health module to display the per-slot command-line prompts for the vCMP guests deployed on this system. These are the same prompts that one would see when logging into a guest via SSH. Example:  
"bigip.mydomain.com:/S1-green-P:Active:Standalone"

**EXAMPLES**  
show vcmp health prompt  
  
Display prompt status for all guests.  
  
show vcmp health prompt my\_guest  
  
Display prompt status for a single guest; "my\_guest".

**OPTIONS**  
For information about the options that you can use with the show command, see help show.

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.  
  
F5 Networks and BIG-IP (c) Copyright 2014. All rights reserved.

**BIG-IP**      2015-11-05    vcmp health prompt(1)

---

## vcmp health software

**NAME**  
software - Display vCMP guest software status.

**MODULE**  
vcmp health

**SYNTAX**  
Display guest software status using the following syntax.

**DISPLAY**  
show software

**DESCRIPTION**  
Use the software component within the vcmp health module to display software status information about the vCMP guests deployed on this system. This is similar to running tmsh show sys software inside the guest.

**EXAMPLES**  
show vcmp health software  
  
Display software status for all guests.  
  
show vcmp health software my\_guest  
  
Display software status for a single guest; "my\_guest".

**OPTIONS**  
For information about the options that you can use with the show command, see help show.

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.  
  
F5 Networks and BIG-IP (c) Copyright 2014. All rights reserved.

## **vcmp traffic-profile**

**NAME**  
traffic-profile - Configures a traffic-profile, which can be applied to a vCMP guest to control characteristics of data-plane network traffic to the guest.

**MODULE**  
vcmp

**SYNTAX**  
Configure the traffic-profile component within the vcmp module using the syntax in the following sections.

**CREATE**  
create traffic-profile [name]  
modify traffic-profile [name]  
options:  
color-policer [color-policer-name]

**DISPLAY**  
list traffic-profile

options:  
all-properties

**DELETE**  
delete traffic-profile [name]

**DESCRIPTION**  
Manage vCMP traffic-profiles running on this host.

**EXAMPLES**  
list vcmp traffic-profile  
  
Lists the current configuration of all traffic-profiles.  
  
create vcmp traffic-profile fiftyMbpsSLAPProfile color-policer  
fiftyMbpsLimiter  
  
Creates a traffic-profile which makes use of the color-policer  
fiftyMbpsLimiter.

**OPTIONS**  
color-policer  
Specifies the color based policer for metering and shaping traffic destined to a guests data-plane.

**SEE ALSO**  
create, delete, edit, glob, list, modify, regex, show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2011-2015. All rights reserved.

## **vcmp virtual-disk-template**

**NAME**  
virtual-disk-template - Manages the vCMP virtual disk templates available on this hypervisor.

**MODULE**  
vcmp

## SYNTAX

Configure the virtual-disk-template component within the vcmp module using the syntax in the following sections.

### DISPLAY

```
list virtual-disk-template
```

#### options:

```
all-properties
```

### DELETE

```
delete virtual-disk-template [name]
```

## DESCRIPTION

The virtual-disk-template component is used to list and delete virtual disk templates that are used to create new virtual disk images for vCMP guests. Virtual disk templates are automatically created by vcmpd when guests move to the Provisioned state and a virtual disk template with the version being installed to the guest's virtual disk image doesn't already exist. This is the only way that virtual disk templates are created. Deleting virtual disk templates frees up space but will slow down future virtual disk image installs of that version; the virtual disk template will need to be first re-created.

## EXAMPLES

```
list vcmp virtual-disk-template
```

Lists all virtual disk templates currently available.

```
delete vcmp virtual-disk-template my_vdisk
```

Deletes the virtual disk template named my\_vdisk. Note that this is only valid if the virtual-disk-template is not currently attached to any vCMP guest.

## SEE ALSO

tmsch vcmp virtual-disk

## COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2010-2014. All rights reserved.

BIG-IP 2015-01-14 vcmp virtual-disk-template(1)

---

## vcmp virtual-disk

### NAME

virtual-disk - Manages the vCMP virtual disks available on this hypervisor.

### MODULE

vcmp

### SYNTAX

Configure the virtual-disk component within the vcmp module using the syntax in the following sections.

#### DISPLAY

```
list virtual-disk
show virtual-disk
```

#### options:

```
all-properties
```

```
show virtual-disk
```

#### DELETE

```
delete virtual-disk [name]
```

## DESCRIPTION

The virtual-disk component is used to list and delete virtual disks that are used by vCMP guests. Virtual disks are automatically created by vcmpd when guests move to the Provisioned state and do not already have virtual disks attached to them. This is the only way that virtual disks are created. Virtual disks that are not attached to any guest can be deleted. Virtual disks not already in use can be explicitly attached to vCMP guests.

## EXAMPLES

```
list vcmp virtual-disk
```

Lists all virtual disks currently available.

```
delete vcmp virtual-disk my_vdisk
```

Deletes the virtual disk named my\_vdisk. Note that this is only valid if the virtual-disk is not currently attached to any vCMP guest.

**SEE ALSO**

create, delete, list, modify, tmsh

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## wam

### wam ad-policy

**NAME**

ad-policy - Configures an ad policy for WebAccelerator for use in ad insertion.

**MODULE**

wam

**SYNTAX**

Configure the ad-policy within the wam module using the syntax shown in the following sections.

**CREATE/MODIFY**

```
create ad-policy [name]
modify ad-policy [name]
options:
  ad-insertion-order [random | sequential]
  ads [add | delete | modify] {
    [name] {
      options:
        url [url]
        preroll [yes | no]
      }
    }
  description [string]
```

**DISPLAY**

```
list ad-policy [name ...]
```

**DELETE**

```
delete ad-policy [name ...]
```

**DESCRIPTION**

You can use the ad-policy component to manage the WebAccelerator ad policies. An ad policy defines how the ad insertion is to be performed while processing video resources. Individual ad urls can be configured in the ad-policy along with the insertion order.

**EXAMPLES**

```
create wam ad-policy my_ad_policy ads add { my_ad1 { preroll yes url
http://www.example.com/ad1.m3u8 } }
```

Creates an ad policy named my\_ad\_policy with an ad named my\_ad1 for the url http://www.example.com/ad1.m3u8 and as a preroll candidate.

```
list wam ad-policy my_ad_policy
```

Displays properties of the ad policy named my\_ad\_policy.

```
delete wam ad-policy my_ad_policy
```

Deletes the ad policy named my\_ad\_policy.

**OPTIONS**

**ad-insertion-order**  
Specifies whether the ads are to be inserted randomly or in the order specified in the policy.

**ads** Specifies the collection of ads.

**description**  
User defined description of an ad policy.

**AD OPTIONS**

url Specifies the url of the ad.

preroll  
Specifies that the ad is a candidate for preroll insertion.  
Preroll ad is inserted at the beginning of the playlist.

SEE ALSO

## wam application

NAME  
application - Configures application for WebAccelerator.

MODULE  
wam

SYNTAX  
Configure the application component within the wam module using the syntax shown in the following sections.

CREATE/MODIFY

```
create application [name]
modify application [name]
options:
  app-service [[string] | none]
  code [number]
  content-expiration-time [date and time]
  description [string]
  hosts [add | delete | modify | replace-all-with] {
    [ [host name] | [glob] ] {
options:
  app-service [[string] | none]
  code [number]
  subdomain-number-of-http [number]
  subdomain-number-of-https [number]
  subdomain-prefix [string]
  }
}
ibr-adaptive-lifetime [number]
ibr-default-lifetime [number]
ibr-prefix [string]
info-header [none | standard | debug]
multibox [disabled | farm | symmetric]
policy [name]
perf-monitor [enabled | disabled]
perf-monitor-data-retention-period [number]
collect-roi-statistics [ enabled | disabled ]
send-metadata [never | always | uncompressed]
roi-report-email-addresses { string }
roi-report-frequency [ every-month | every-week ]
roi-report-name [string]
roi-report-next-time [date and time]
roi-report-smtp-config [ smtp configuration object name ]
roi-report-collect-statistics { caching-bytes-saved | client-ibred-links |
  compression-bytes-saved | icc-refed-links | inlined-links |
  caching-requests-saved | client-ibred-links-recd | icc-inlined-links |
  image-opt-bytes-saved | minification-bytes-saved }

edit application [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  non-default-properties
```

```
reset-stats application
reset-stats application [ [ [name] | [glob] | [regex] ] ... ]
```

DISPLAY

```
list application [name ...]
show running-config application [name ...]
options:
  all-properties
  non-default-properties
  partition
  predefined
```

```
show application
show application [name]
options:
  all-properties
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  detail
  field-fmt
```

```
DELETE
delete application [name ...]
```

Note: You must remove all references to an application before you can delete it.

#### DESCRIPTION

You can use the application component to configure the host map, select policies, and set application wide parameters that affect WebAccelerator behavior.

#### EXAMPLES

```
create application my_app hosts add { host1.com host2.com } policy
my_local_policy
```

Creates a WebAccelerator application with a host map consisting of two hosts, host1.com and host2.com, and a local policy set to my\_local\_policy.

```
modify application my_app remote-policy my_remote_policy
```

Sets my\_remote\_policy as the remote policy for application my\_app.

```
modify application my_app modify hosts { host1.com { subdomain-number-
of-http 3 subdomain-prefix abcd } }
```

Sets the number of subdomain hosts to 3 and the subdomain prefix to abcd for host host1.com of WebAccelerator application my\_app.

```
modify application my_app roi-report-name "my_report" roi-report-
frequency monthly roi-report-next-time now roi-report-email-addresses
add { someone@domain.com } roi-report-smtp-config smtp-config roi-
report-collect-statistics add { caching_bytes_saved
caching_requests_saved }
```

Sets the ROI report name to my\_report. The ROI report is set to be sent monthly, and the next time to send the report is set to now. The ROI report will be mailed to someone@domain.com. The SMTP configuration used to send the ROI report will be the predefined configuration of name smtp-config. The ROI report will contain the statistics specified by roi-report-collect-statistics, which in this case would be caching\_bytes\_saved and caching\_requests\_saved.

```
delete application my_app
```

Deletes WebAccelerator application my\_app.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

code Specifies a numeric non-zero code of the application or application host, which is used for troubleshooting and performance reporting. Each application or application host must have a unique code. If not supplied, it will be generated by the system. Use the keyword generate to specify that the system generate a new unique code.

##### content-expiration-time

Specifies the date and time that limits how old cached documents can be to still be served from the cache. All documents older than this date and time are considered expired. For example, the following example expires all cached documents of the application my\_app:

```
modify application my_app content-expiration-time now
```

##### description

Specifies the object type description.

##### hosts

Specifies the list of domain names (host names) that might appear in HTTP requests for your Web application. These are the same host names that DNS has mapped to the server machine on which your WebAccelerator system is running. To map a group or range of requested host names to a single destination host, you can use an asterisk (\*) as a wildcard for the first part of the host name.

##### ibr-adaptive-lifetime

Specifies the adaptive lifetime for Intelligent Browser Referencing in seconds. The default value is 864000 (10 days).

##### ibr-default-lifetime

Specifies the lifetime for Intelligent Browser Referencing in seconds. The default value is 15724800 (6 months).

##### ibr-prefix

Specifies a prefix for the Intelligent Browser Referencing tag. The default value is ";wa".

##### info-header

Enables and controls the appearance of HTTP header X-WA-Info: in

responses from WebAccelerator. This header can be used for troubleshooting the WebAccelerator system and for tuning policies. The possible values are:

`debug`

HTTP header X-WA-Info: is included into responses with standard information, with some additional values to aid WebAccelerator troubleshooting.

`none` HTTP header X-WA-Info: is not included into responses.

`standard`

HTTP header X-WA-Info: is included into responses with standard information, such as S-code, policy, and node codes, etc.

`multibox`

Specifies which type of multibox support is required for this application, if any. Options are disabled, for deployments with an independent WebAccelerator; farm, for farm deployments; and symmetric, for symmetric deployments. When this is not disabled, the application should be shared by a config sync device group containing all devices in the deployment. It enables the broadcast of invalidation messages to other devices in the device group, and, when set to symmetric, also enables symmetric processing of traffic.

`partition`

Displays the administrative partition within which the application resides.

`perf-monitor`

Specifies whether performance monitoring for this application is enabled. Enabling performance monitoring on many applications may affect the overall performance of WebAccelerator. The default value is disabled.

`perf-monitor-data-retention-period`

Specifies the time period in days for how long the performance data must be preserved. The default value is 30 days.

`collect-roi-statistics`

Specifies whether ROI statistics collection for this application is enabled. The default value is disabled.

`roi-report-name`

Specifies the name of ROI statistics report if the statistics collection is enabled and report generation is desired.

`roi-report-frequency`

Specifies the frequency of ROI statistics report, if the statistics collection is enabled and report generation is desired. The options are every week or month.

`roi-report-email-addresses`

Specifies the email-addresses to which ROI statistics report will be sent.

`roi-report-next-time`

Specifies the next time when the ROI statistics report will be sent.

`roi-report-smtp-config`

Specifies the smtp configuration that will be used to send the scheduled ROI report over email.

`roi-report-collect-statistics`

Specifies which statistics are to be included in the ROI statistics report.

`policy`

Specifies the acceleration policy to which you want to assign the new Web application.

`predefined`

Displays if this application is predefined.

`send-metadata`

Specifies when Etag HTTP headers will be included into responses. The default value is always.

`always`

Etag HTTP headers will always be included into responses.

`never`

Etag HTTP headers will not be included into responses.

`uncompressed`

Metadata HTTP headers will be included only if response is uncompressed.

`subdomain-number-of-http`

Specifies the number of HTTP subdomains that you want the WebAccelerator system to generate. The WebAccelerator system uses these additional subdomains only on embedded URLs or links that request images or scripts. The default value is 0.

`subdomain-number-of-https`

Specifies the number of HTTPS subdomains that you want the WebAccelerator system to generate. The WebAccelerator system uses these additional subdomains only on embedded URLs or links that request images or scripts. The default value is 0.

#### subdomain-prefix

Specifies the prefix that you want the system to assign to the subdomains. The default value is wa.

For example, if the Requested Host is `www.siterequest.com`, and you select 2 from the HTTP Subdomains box and type `wa` in the Subdomain Prefix box, the WebAccelerator system changes the domain on qualifying embedded URLs and links to use the following domains:

```
wal.www.siterequest.com
wa2.www.siterequest.com
```

Note: You must configure DNS with these entries, and they must map to the same IP address as the base origin server (`www.siterequest.com` in this example).

## wam domain list

#### NAME

`domain-list` - Configures a list of domains for WebAccelerator for use in inserting DNS prefetch tags.

#### MODULE

wam

#### SYNTAX

Configure the `domain-list` component within the `wam` resource module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create domain-list [name]
modify domain-list [name]
options:
  app-service [[string] | none]
  description [[string] | none]
  domains
    [add | delete | none | replace-all-with] {
    [string] ...
    }
```

##### DISPLAY

```
list domain-list [name ...]
```

##### DELETE

```
delete domain-list [name ...]
```

#### DESCRIPTION

You can use the `domain-list` component to manage the domain list resources used by the WebAccelerator DNS prefetching feature. A domain-list must be created, then added to the appropriate domain-lists on a WebAccelerator policy node in order for the domains within the domain list to be inserted into a document.

#### EXAMPLES

```
create domain-list my_domain_list domains add {example.com
example2.com}
```

Creates a domain list resource for the domains `example.com` and `example2.com` for use in inserting DNS prefetch tags.

```
list domain-list my_domain_list
```

Displays properties of the `domain-list` resource named `my_domain_list`.

```
delete domain-list my_domain_list
```

Deletes the `domain-list` resource named `my_domain_list`.

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**domains**  
Specifies the domains described by the domain list resource.

SEE ALSO  
create, delete, edit, list, modify, show, tmsh

**COPYRIGHT**  
No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## wam object-type

**NAME**  
object-type - Configures object types for WebAccelerator.

**MODULE**  
wam

**SYNTAX**  
Configure the object-type component within the wam module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create object-type [name]  
modify object-type [name]  
options:  
app-service [[string] | none]  
code [ [number] | generate]  
compression [disabled | policy-controlled]  
description [string]  
extensions [add | delete | modify | replace-all-with] {  
[document extension]  
...  
}  
mime-types [add | delete | modify | replace-all-with] {  
[MIME type]  
...  
}  
symmetric-compression [ disabled | enabled ]

edit object-type [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties

**DISPLAY**  
list object-type [ [ [name] | [glob] | [regex] ] ... ]  
show running-config object-type [ [ [name] | [glob] | [regex] ] ... ]  
options:  
all-properties  
non-default-properties  
group  
partition  
predefined

**DELETE**  
delete object-type [name ...]

**DESCRIPTION**  
You can use the object-type component to manage recognized types of objects. These object types are used to classify documents processed by WebAccelerator. A document can be classified by its file extension or MIME type.

**EXAMPLES**  
create object-type documents.abcd extensions add { abc abcd } mime-types add { text/abcd text/x-abcd }  
  
Creates a WebAccelerator object type named documents.abcd that includes all documents with extensions .abc or .abcd, and MIME types text/abcd or text/x-abcd.  
  
delete object-type documents.abcd

Deletes the pool named documents.abcd.

list object-type documents.abcd

Displays properties of the object-type named documents.abcd.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

code Specifies the numeric non-zero code of the object type, which is used troubleshooting and performance reporting. Each object type must have unique code. If not supplied, it will be generated by the system. Use keyword generate to have the system generate a new unique code.

##### compression

Specifies if this object type supports compression and when it can be enabled. The default value is disabled.

Valid values are:

##### disabled

Never compresses the response. If you use this option, be aware that it overrides any compression setting configured for the assembly rule that the WebAccelerator system matches to the specified object type. You should use this option only if you want the WebAccelerator system to ignore assembly rules for the specified object type.

##### policy-controlled

Specifies that compression is controlled by WebAccelerator policy. The compression setting is specified in the assembly rule that the WebAccelerator system matched for this object type. In most cases, you should use this option.

##### description

Specifies the object type description.

##### extensions

Specifies the extension the WebAccelerator system should find in the file name or Content-Disposition header of the response, in order to match to the specified object type.

##### group

Displays the group portion of the name.

##### mime-types

Specifies the MIME-types that the WebAccelerator system should find in the Content-Type header of the response, in order to match to the specified object type.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify. The name of the object type must be in form group.type where group is used to organize object type based on common usage pattern. For example, documents, binary, pages. The type is used to uniquely identify the object type within a group.

##### partition

Displays the administrative partition within which the object type resides.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

##### symmetric-compression

Specifies whether this object type will be compressed on the WAN link in a symmetric multibox deployment.

#### SEE ALSO

create, delete, edit, list, modify, show, tmsh

#### COPYRIGHT

              values [add | modify | delete | replace-all-with] {
                [ [regex] | [string] ] {
                  options:
                    app-service [[string] | none]
                    can-be-empty [yes | no]
                    can-be-missing [yes | no]
                    invert-match [yes | no]
                }
              }
            }
          }
        }
      }
    }
  }
}
}
partition [name]
publish-build [integer]
publish-comment [string]
published-on [date]

```

Note: Policies can be created only in the Drafts folder. This is required to support publishing functionality. You may create multiple Drafts folders, one for each folder where published policies are going to reside.

**DISPLAY**  
list policy [name ...]

show running-config policy [name ...]

options:  
all-properties  
non-default-properties  
partition  
predefined  
state

#### DELETE

delete policy [name ...]

#### SAVE/LOAD

save policy [name]  
load policy [name]  
options:  
overwrite  
file [filename]

#### PUBLISH

publish policy [name]  
options:  
publish-comment [string]  
publish-build [integer]

Note: Published policies can be deleted, but cannot be modified. The only way to update a published policy is to edit and then publish its development version.

#### DESCRIPTION

You can use the policy component to manage WebAccelerator acceleration policies. An acceleration policy is a collection of defined rule parameters that dictate how the WebAccelerator system handles HTTP requests and responses. The WebAccelerator system uses two types of rules to manage content: matching rules and acceleration rules. Matching rules are used to classify requests by object type and match the request to a specific acceleration policy. Once matched to an acceleration policy, the WebAccelerator system applies the associated acceleration rules to manage the requests and responses. There are multiple types of acceleration rules: variation, proxy, proxy override, parameter value substitution, and invalidation. The WebAccelerator system ships with several predefined acceleration policies that are optimized for specific Web applications, in addition to several non-application specific policies for general delivery and one for an optional symmetric deployment.

#### EXAMPLES

Note: For the following examples, the current folder is assumed to be set to /Common.

```
create policy "Drafts/My Policy"
```

Creates a new empty policy named My Policy in the folder /Common/Drafts.

```
create policy "Drafts/My Policy" copy-from "/Common/Generic Policy - Complete"
```

Creates a new policy My Policy in the folder /Common/Drafts by copying standard system policy /Common/Generic Policy - Complete.

```
modify policy "Drafts/My Policy" copy-from "/Common/Generic Policy - Complete"
```

Modifies the policy My Policy by overwriting it with standard system policy /Common/Generic Policy - Complete.

```
modify policy "Drafts/My Policy" nodes add { "My Node" { default-from Site }}
```

Adds a new node My Node as the child node of the node Site.

```
modify policy "Drafts/My Policy" nodes modify { "My Node" { matching add { content-type { values add { pages.other }}}}}
```

Adds a new matching rule into the node My Node. The rule will match content type of the requests to WAM object type pages.other.

```
publish policy "Drafts/My Policy" publish-comment "Added new node My Node"
```

Publishes the policy My Policy.

```
modify policy "Drafts/My Policy" nodes delete { "My Node" }
```

Deletes the node My Node from the policy My Policy.

```
delete policy "My Policy"
```

Deletes the policy My Policy.

```
save policy "My Policy" file policy.txt
```

Saves the policy My Policy into the file /var/local/wam/policy.txt.

```
load policy "Drafts/My Policy" overwrite file /tmp/policy.txt
```

Loads the policy My Policy from the file /tmp/policy.txt and overwrites the policy if it already exists.

#### POLICY OPTIONS

app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object,

you cannot modify or delete the object. Only the application service can modify or delete the object.

**code** Specifies a numeric non-zero code of the policy that is used for troubleshooting and performance reporting. Each policy must have a unique code. If not supplied, it will be generated by the system. Use the keyword **generate** to specify that the system generate a new unique code.

**copy-from**  
Specifies the name of an existing policy from which to copy all configuration options. If this field is used in the **modify** command, the configuration options of the existing policy will be replaced with the new ones. The **code**, **state**, **publish-build**, **publish-comment**, and **published-at** options are not updated.

**description**  
User defined description of a policy.

**nodes**  
Specifies the collection of policy nodes. Matching rules and acceleration rules for acceleration policies are organized on the Policy Tree, which consists of nodes. The structure of the Policy Tree supports a parent-child relationship. This enables you to easily randomize rules. That is, because a leaf node in a Policy Tree inherits all the rules from its root node and branch node, you can quickly create multiple leaf nodes that contain the same rule parameters by creating a branch with multiple leaf nodes. If you override or create new rules at the branch node level, the WebAccelerator system reproduces those changes to the associated leaf nodes.

**partition**  
Displays the administrative partition within which the policy resides.

**publish-build**  
Specifies the policy build version that was used during policy publishing. If not specified, this number is automatically incremented by the WebAccelerator system.

**publish-comment**  
Specifies the user supplied comment that describes the changes in the policy that is being published.

**published-on**  
Specifies the date and time when this policy was last published.

**file** Specifies the file name where the policy is going to be saved or loaded from. If a full path is not specified, it is set to `/var/local/wam` directory.

**overwrite**  
Specifies that the policy file for the **save** command or the policy component for the **load** command can be overwritten if it exists.

#### NODE OPTIONS

**always-proxy**  
Specifies that all requests matching this node must be proxied. If it enabled, proxy rules are not used, even if configured. **proxy-override** rules still apply.

**app-service**  
Specifies the name of the application service to which this node belongs. The default value is none. Note: If the **strict-updates** option is enabled on the application service that owns the object, you cannot modify or delete this node. Only the application service can modify or delete this node.

**assembly-compression**  
Specifies, when enabled, that the WebAccelerator system compresses content for responses, using **gzip-encoding**. Note that to use this feature, you must set the **compress** value for the response's object type in the corresponding object-type component, and the client must be able to accept **gzip-encoded** content. The default value is enabled.

**assembly-compression-ows**  
Specifies, when enabled, that the WebAccelerator system requests **gzip-encoded** or **deflate-encoded** content from the origin Web server. Note that the origin Web server will comply only if it supports compression, otherwise it will reply with **uncompressed** content. The default value is disabled.

**assembly-concatenation**  
Specifies, when enabled, that the WebAccelerator system will perform **JavaScript/CSS concatenation** in HTML documents. The URLs that may be concatenated are specified using the **assembly-concatenation-sets** option. See the WebAccelerator documentation for more details. The default value is disabled.

**assembly-concatenation-sets**  
Specifies the concatenation sets that are active for this node. If a URL in the HTML document that belongs to one of the enabled sets is found, it will be transformed with concatenation using the URL of the configured set. This is an ordered set, and if the URL exists in multiple active concatenation sets, the first set specified by this option will be used. See the WebAccelerator documentation for more details.

**assembly-css-inlining**  
Specifies, when enabled, that the WebAccelerator system will inline CSS URLs in HTML documents. The CSS URLs that may be inlined are specified using the **assembly-css-inlining-urls** option.

See the WebAccelerator documentation for more details. The default value is disabled.

**assembly-css-inlining-urls**  
Specifies the CSS URLs that may be inlined.

**assembly-css-reorder**  
Specifies, when enabled, that the WebAccelerator system will reorder CSS URLs to the HEAD section of HTML documents. The CSS URLs that may be reordered are specified using the **assembly-css-reorder-urls** option. See the WebAccelerator documentation for more details. The default value is disabled.

**assembly-css-reorder-cache-size**  
Specifies the size of the intermediate cache used to store CSS URLs being reordered. Increasing the size of this cache allows more CSS URLs to be reordered. The default value is 8kB. The maximum value is 8kB.

**assembly-css-reorder-urls**  
Specifies the CSS URLs that may be reordered. The URLs must be fully-qualified and whitespace used to separate URLs. The URLs must correspond to WebAccelerator URL resources created by the command `create wam resource url`. See the help for `wam resource url`.

**assembly-dns-prefetch**  
Specifies, when enabled, that the WebAccelerator system manipulates an HTML document to add DNS prefetch tags at the end of the head. The DNS prefetch tags added are the combined list of domain lists specified in **assembly-dns-prefetch-domain-lists**. DNS prefetch tags will not be inserted in the following conditions: when DNS prefetching is explicitly disabled in the document, either by an HTTP header or by a meta-tag in the head of the HTML document; when the connection is served over HTTPS without **assembly-dns-prefetch-https-enable** enabled; or when the connection is to a client browser that does not support DNS prefetching.

In a document, most browsers will perform DNS prefetching on all domains linked with an HREF. This will speed up performance by having the browser cache possible DNS resolutions before a client clicks on a link, but DNS prefetching cannot automatically occur when a link is created through other means (such as javascript). Inserting DNS prefetch tags addresses this issue.

The default value is disabled.

**assembly-dns-prefetch-domain-lists**  
Specifies the lists of domains that will be inserted into a document. The domain lists must correspond to WebAccelerator domain list resources created by the command `create wam resource domain-list`. See the help for `wam resource domain-list`.

**assembly-dns-prefetch-https-enable**  
Specifies, when enabled, that the WebAccelerator system manipulates an HTML document to add DNS prefetch tags at the end of the head when a document is served over HTTPS when the client browser supports DNS prefetching. By default, most browsers that support DNS prefetching will not do any DNS prefetching on pages served over HTTPS. Enabling **assembly-dns-prefetch-https-enable** will insert a meta-header that will turn on DNS prefetching on the page and a meta-header turning off DNS prefetching for the rest of the page. DNS prefetching cannot be turned on for the rest of an HTML document once the meta-header turning off DNS prefetching is reached.

DNS prefetching is turned off on most browsers serving pages over HTTPS by default as a security measure. DNS prefetching can be used to track which pages are seen over HTTPS by watching the domain resolution requests sent out by the client. According to DNS prefetch standards currently, turning on DNS prefetching on a page will cause all links in the page to have their domains prefetched. This is mitigated by this option with the insertion of an HTTP meta-header turning off DNS prefetching after the DNS tags inserted by the WebAccelerator system. Turning on DNS prefetching for the rest of the page in a request served over HTTPS can be done with the **assembly-dns-prefetch-https-automatic** option.

The default value is disabled.

**assembly-dns-prefetch-https-automatic**  
Specifies, when enabled, that the WebAccelerator system will not insert a meta-tag into an HTML document served over HTTPS turning off DNS prefetching for the rest of a page. By default, most browsers that support DNS prefetching will not do any DNS prefetching on pages served over HTTPS. **assembly-dns-prefetch-https-enable** must be enabled for this option to work.

The default value is disabled.

**assembly-ibr**  
Specifies, when enabled, that the WebAccelerator system manipulates the Web browser cache to reduce requests to your site for relatively static content, such as images and style sheet (CSS) files. The default value is enabled.

**assembly-image-inlining**  
Specifies, when enabled, that the WebAccelerator system will inline image URLs in CSS documents. The image URLs that may be inlined are specified using the **assembly-image-inlining-urls** option. See the WebAccelerator documentation for more details. The default value is disabled.

**assembly-image-inlining-max-size**

Specifies the maximum size of the image that is allowed to be inlined. The default value is 2kB. The maximum value is 8kB.

**assembly-image-inlining-urls**

Specifies the image URLs that may be inlined.

**assembly-js-inlining**

Specifies, when enabled, that the WebAccelerator system will inline JS URLs in HTML documents. The JS URLs that may be inlined are specified using the `assembly-js-inlining-urls` option. See the WebAccelerator documentation for more details. The default value is disabled.

**assembly-js-inlining-urls**

Specifies the JS URLs that may be inlined.

**assembly-js-reorder**

Specifies, when enabled, that the WebAccelerator system will reorder JavaScript URLs to the end of HTML documents. The JavaScript URLs that may be reordered are specified using the `assembly-js-reorder-urls` option. See the WebAccelerator documentation for more details. The default value is disabled.

**assembly-js-reorder-cache-size**

Specifies the size of the intermediate cache used to store JavaScript URLs being reordered. Increasing the size of this cache allows more JavaScript URLs to be reordered. The default value is 8kB. The maximum value is 8kB.

**assembly-js-reorder-urls**

Specifies the JavaScript URLs that may be reordered. The URLs must be fully-qualified and whitespace used to separate URLs. The URLs must correspond to WebAccelerator URL resources created by the command `create wam resource url`. See the help for `wam resource url`.

**assembly-intelligent-client-cache**

Specifies, when enabled, that the WebAccelerator system will Intelligent Client Cache HTML documents. See the WebAccelerator documentation for more details. The default value is disabled.

**assembly-icc-force**

Specifies, when enabled, that the WebAccelerator system will Intelligent Client Cache HTML documents, even if the client does not support HTML5 localStorage. See the WebAccelerator documentation for more details. The default value is disabled.

**assembly-icc-image-max-size**

Specifies the maximum size of the image that is allowed to be inlined as part of Intelligent Client Caching. The default value is 32kB. The maximum value is 50kB.

**assembly-icc-css-max-size**

Specifies the maximum size of the CSS that is allowed to be inlined as part of Intelligent Client Caching. The default value is 50kB. The maximum value is 1024kB.

**assembly-icc-js-max-size**

Specifies the maximum size of the JS that is allowed to be inlined as part of Intelligent Client Caching. The default value is 50kB. The maximum value is 1024kB.

**assembly-icc-max-num-urls**

Specifies the maximum number of links in an HTML document that are allowed to be inlined as part of Intelligent Client Caching. The default value is 10. The maximum value is 100.

**assembly-icc-min-client-expiry**

Specifies the minimum client expiry of a resource that is allowed to be inlined as part of Intelligent Client Caching. The default value is 2days.

**assembly-minification**

Specifies, when enabled, that the WebAccelerator system will minify JavaScript and CSS.

**assembly-multiconnect**

Specifies, when enabled, that the WebAccelerator system modifies embedded URLs with unique sub-domains that prompt the browser to open more persistent connections for each supported protocol (HTTP or HTTPS). To use this feature, you must configure DNS with the additional domains and map those domains to the same IP address as the base origin server. The default value is enabled.

**assembly-on-proxies**

Specifies, when enabled, that the WebAccelerator system applies the Content Compression and Intelligent Browser Referencing features (if enabled) to content served to clients, even if the content is not served from the WebAccelerator system's cache. Enable this option if you are using the Content Compression or Intelligent Browser Referencing features. The default value is enabled.

**assembly-pdf-linearization**

Specifies, when enabled, that the WebAccelerator system applies linearization on PDF documents, if the documents match the node matching rules. PDF linearization transforms the document to include the index of the pages in the beginning. This allows Web browsers to load and show specific pages rather than a whole document. See the WebAccelerator documentation for more details. The default value is disabled.

**optimize-image**

Specifies whether image optimization should be applied and the

format conversion to use. Each of the 4 supported formats (JPEG, PNG, GIF, TIFF) can be converted to any of the others. Images using a capability unique to one format may lose that feature when converted to a format that does not support it. (For example, animated GIFs or multipage-TIFFs will have only the first image when converted to PNG or JPEG). Transparency will be lost when converting from GIF or PNG to JPEG. TIFF is a container for many different image formats so the results will be best-effort and may not list completely.

A converted image will likely have a different number of bytes after conversion. Some conversions are likely to produce fewer bytes; however, a requested conversion will be done even if it results in more bytes (for consistency). For example, you may want to offer multiple formats of an image without storing them all on a server.

A correct Content-Type header will be generated for converted images, but HTML files will not be rewritten.

`optimize-for-client` Specifies whether to allow conversion to a format and/or size which is optimum for the specific client making the request but which, if saved by that client and later sent elsewhere, might not be appropriate.

`webp-quality` WebP is a "lossy" compression format. This means when you convert an image to a WebP and then convert it back, you will not get back exactly the same image you started with. Compression changes the amount of information stored (and therefore the number of bytes), but not the image dimensions (the number of pixels). The `webp-quality` attribute represents the absolute quality of the WebP produced. Compression (quality) is represented as a number between 1-100 where 1 is minimal quality, but small, and 100 is high-quality, but large. For most images, useful values of quality will be from about 30-70.

`jpegxr-quality` JPEG-XR is a "lossy" compression format. This means when you convert an image to a JPEG-XR and then convert it back, you will not get back exactly the same image you started with. Compression changes the amount of information stored (and therefore the number of bytes), but not the image dimensions (the number of pixels). The `jpegxr-quality` attribute represents the absolute quality of the JPEG-XR produced. Compression (quality) is represented as a number between 1-100 where 1 is minimal quality, but small, and 100 is high-quality, but large. For most images, useful values of quality will be from about 5-30.

`jpeg-quality-is-relative` =item `jpeg-quality`

JPEG is a "lossy" compression format. This means when you convert an image to a JPEG and then convert it back, you will not get back exactly the same image you started with. Compression changes the amount of information stored (and therefore the number of bytes), but not the image dimensions (the number of pixels). When `jpeg-quality-is-relative` is set to no, the `jpeg-quality` attribute represents the absolute quality of the JPEG produced. Compression (quality) is represented as a number between 1-100 where 1 is minimal quality, but small, and 100 is high-quality, but large. For most images, useful values of quality will be from about 30-100. Because information once lost cannot be regained, converting a low-quality JPEG to a higher quality is pointless and image optimization will prevent that (by not changing the original to a higher JPEG quality).

You might be unable to choose a specific absolute quality for JPEG images. When `jpeg-quality-is-relative` is set to yes, the relative JPEG quality setting is enabled. In this case, `jpeg-quality` is a percentage (a number between 1-100) that when multiplied by each JPEG's original quality, becomes its optimized quality.

`jpeg-strip-exif`

JPEG files have a header (called EXIF) that contains optional data such as a date, time, camera model, exposure settings, and so on. The EXIF header can also contain a color profile, which is required when included. EXIF headers can be small or large. Unless they contain a color profile, they do not affect displaying the image, and so can be removed if the loss of the information they contain is acceptable. There are four options for this setting:

`no` Leaves any EXIF headers alone.

`yes` Always strips EXIF headers.

`if-safe`

Only strips EXIF headers if they do not have color profiles (ensures that images display properly).

`make-safe`

Applies the color profile and then strips the EXIF header (typically decreases image file size). Applying a color profile requires additional CPU time.

`jpeg-strip-keeps-copyright` This setting affects the meaning of `jpeg-strip-exif`. If it is set, stripping the EXIF header will strip everything except the Copyright notice (if one is present).

`jpeg-sampling-factor`

Sets the sampling factor to be used when producing JPEG images. The default value is `preserve`, which matches the original file. You can also explicitly specify this option, as it can sometimes improve compression.

`jpeg-progressive-encoding`

When enabled, progressive encoding will be used in JPEG images. For large JPEG files, this can improve compression. When this is enabled, it will be applied only if the file is large enough to improve compression.

`png-256-colors`

It is often possible to significantly reduce the size of PNG files

without changing their appearance very much by reducing the number of colors to 256 optimally selected values. This optimization is enabled when png-256-colors is set to yes.

#### cache-complete-only

Specifies, when enabled, that the WebAccelerator system caches HTML pages only if the HTML code within the page contains begin and end tags. When disabled, the WebAccelerator system reviews HTTP response headers to determine if the information contained on the page is complete. The default value is enabled.

#### cache-first-hit

Specifies that the first response should be cached according to the policy caching settings. When this is off, the response is cached when more than one request for the document has been seen. Turning this on can reduce cache churn for unpopular documents. The default value is no.

#### cache-mode

Specifies how where the cached documents will be stored. The default value is memory-and-disk. Possible values are:

##### memory-and-disk

The cached documents will be stored in memory or on disk.

##### memory-only

The cached documents will be stored in memory only.

#### cache-priority

Specifies the cache admission priority of documents matching the policy node. Documents with high priority are more likely to be admitted into the cache. The default value is medium. Possible values are:

low Documents will have low priority.

##### medium

Documents will have medium priority.

high Documents will have high priority.

#### cache-stand-in-period

Specifies the amount of time that the WebAccelerator system continues to serve content from cache if the origin Web server does not respond to the WebAccelerator system's requests for fresh content. The default value is 0 (zero), which means the WebAccelerator system responds to requests for expired content with a HTTP 404 error.

code Specifies a numeric non-zero code for the node that is used for troubleshooting and performance reporting. All nodes must have unique codes within the policy. If not supplied, the code will be generated by the system. Use the keyword generate to specify that the system generate a new unique code.

#### coherency

Specifies if the WebAccelerator system will attempt to keep content matching the associated node in sync across the blades of a cluster. The default behavior is to keep content in sync.

#### blade

The cached documents will not be kept coherent across blades. This causes each blade to have its own copy of a given cached document.

#### cluster

The cached documents will be kept coherent across blades. This causes the cluster to have single version of a given cached document.

#### defaults-from

Specifies the node that you want to use as the parent node. Your new node inherits all options and values from the parent node specified. The default value is none, which means this is a root node.

#### description

User defined description of a node.

#### invalidations

Specifies the collection of invalidations rules. Invalidations rules enable you to expire cached content before it has reached its time-to-live (TTL) value. This is useful when content updates are event-driven, such as when an item is added to a shopping cart, a request contains a new auction bid, or a poster has submitted content on a forum thread. Invalidations rules can be created only on leaf nodes.

#### lifetime-cache-control-extensions

Enables you to configure extension tokens to be added to the cache-control header of HTTP response. The WebAccelerator system does not process any of these extensions. It is possible that the origin Web server will send cache-control extensions as well. You can choose whether to preserve them by including the custom-extension in the lifetime-preserve-response-values list.

#### lifetime-cache-max-age

Specifies the amount of time that the WebAccelerator system serves content from the cache before requesting fresh content from the origin Web server. The default value is 4 hours.

#### lifetime-honor-ows

Specifies, if enabled, that the WebAccelerator system honors certain cache-control directives from the origin Web server

response to determine cache lifetime. The default value is disabled.

#### lifetime-honor-ows-values

Specifies which Cache-Control directive from the origin Web server response will determine cache lifetime. Available directives are all-values, private, no-cache, no-store, must-revalidate, proxy-revalidate, max-age, s-maxage, and expires. This option is only effective if lifetime-honor-ows is enabled.

#### lifetime-honor-request

Specifies, if enabled, that the WebAccelerator system honors certain Cache-Control directives from the client's browser request to determine cache lifetime. The default value is enabled.

#### lifetime-honor-request-values

Specifies which cache-control directive from client's browser request will determine cache lifetime. Available directives are all-values, no-cache, no-store, max-age, max-stale, and min-fresh. This option is only effective if lifetime-honor-request is enabled. The default values are max-age, max-stale, and min-fresh.

#### lifetime-http-heuristic

Specifies the percentage, based on the HTTP Last-Modified header, that the WebAccelerator system uses to compute TTL values for cached content. For example, if content was modified 30 days ago and the lifetime-http-heuristic option is set to 50%, the WebAccelerator system caches the content for 15 days. This option is applicable only if you use the HTTP Last-Modified headers to identify content lifetime. The default value is 50%. This option is effective only if lifetime-use-heuristic is enabled.

#### lifetime-insert-no-cache

Specifies, when enabled, that the WebAccelerator system inserts a no-cache directive into the HTTP Cache-Control header, which stops the client's browser from locally caching content. This value overrides the HTTP Cache-Control header cache directives sent to the client by the origin Web server.

#### lifetime-preserve-response

Specifies, if enabled, that the WebAccelerator system preserves certain Cache-Control directives from the origin Web server and includes them into client's browser response. The default value is enabled.

#### lifetime-preserve-response-values

Specifies which Cache-Control directive from the origin web server response will be preserved in response to the client's web browser. Available directives are all-values, private, no-cache, no-store, must-revalidate, proxy-revalidate, max-age, s-maxage, expires, and custom-extension. This option is only effective if lifetime-preserve-response is enabled. The default value is all-values.

#### lifetime-response-max-age

Specifies, when enabled, the amount of time that the client's browser should locally store content. This value overrides the max-age and expires the directives in the HTTP Cache-Control header that are sent to the client by the origin web server, only if the new value for the max-age is greater than the value supplied by the origin web server. Modify this value only if there is an acceptable trade off between the freshness of the content served to clients and overall site performance.

#### lifetime-response-s-maxage

Specifies, when enabled, the amount of time that the client's browser should locally store shared content. This value overrides the s-maxage and expires the directives in the HTTP Cache-Control header that are sent to the client by the origin web server, only if the new value for the s-maxage is greater than the value supplied by the origin web server. Modify this value only if there is an acceptable trade off between the freshness of the shared content served to clients and overall site performance.

#### lifetime-stand-in-codes

Specifies that the WebAccelerator system is allowed to serve stale content from the cache if it is not able to re-validate its freshness with the origin web server. The WebAccelerator system serves invalid content to the downstream proxies or clients if the response code from the origin web server matches one of codes specified with this option. This option is effective only if cache-stand-in-period has a non-zero value. The default values are 404, 500, and 504.

#### lifetime-use-heuristic

Specifies, when enabled, that the WebAccelerator system uses the percentage from lifetime-use-heuristic option to compute TTL values for cached content. The default value is no.

#### matching

Specifies the collection of matching rules. The rules consist of the HTTP request data type parameters that the WebAccelerator system uses to match an incoming HTTP request to a specified node. The following types of HTTP parameters are available for matching rules: host, path, extension, query-param, unnamed-query-param, path-segment, cookie, user-agent, referrer, protocol, method, header, client-ip, and content-type.

#### object-min-size

Specifies the minimum object size required in order for content matching the associated node to be eligible for caching. The default behavior is to use the minimum object size specified by the associated web-acceleration profile.

#### object-max-size

Specifies the maximum object size allowed for content matching the associated node in order to be eligible for caching. The default behavior is to use the maximum object size specified by the associated web-acceleration profile.

#### order

Specifies the order of the node in the Policy Tree. All nodes in the policy must have an order. The order numbers are sequential, starting from 2. Orders 0 and 1 are reserved for internal use. The child node orders must be greater than the order of their parent node. You can change the order of the nodes by updating the order option of the node that you would like to move. The system honors the specified order if it falls within the range of sibling node orders. Otherwise, the system picks the closest valid order number. The remaining nodes are automatically re-ordered to free requested order number. The node order is also used as a last resort to determine which node to use when multiple nodes match the request. The node with a lower order wins. New nodes have their order assigned automatically to make them last among their siblings.

#### proxy

Specifies the collection of proxy rules. In general, proxy rules options are relevant to only requests that match their node, rather than to matched responses. The following types of HTTP parameters are available for proxy rules: host, query-param, unnamed-query-param, path-segment, cookie, user-agent, referrer, protocol, method, header, and client-ip.

#### proxy-override

Specifies the collection of proxy override rules. You can define proxy override rules and associated conditions under which the WebAccelerator system should ignore proxying rules options. The following types of HTTP parameters are available for proxy override rules: host, query-param, unnamed-query-param, path-segment, cookie, user-agent, referrer, protocol, method, header, and client-ip.

#### request-queueing

Specifies, when enabled, that the WebAccelerator system will queue requests for expired or new documents and proxy fewer requests to the origin web server (OWS). If the response is cachable, the response will be served to all waiting requests; if not, the waiting requests will proxy normally.

#### response-codes-cached

Specifies the collection of HTTP response codes that determine whether the WebAccelerator system should cache the content. The valid codes are 300, 301, 302, 307, and 410. The codes 200, 201, 203, and 207 are included into the list implicitly. The default values are 300 and 301.

#### substitutions

Specifies the collection of parameter value substitution rules. Some requested pages include hyperlinks that require that specific information appear in the response. You can configure parameter value substitution so that when a query parameter contains identification information for a sites visitors, it prompts the WebAccelerator system to serve different content for the request, based on the specific visitor. Conversely, if parameter value substitution is not configured, the WebAccelerator system uses the value that it cached for the original request, for all subsequent requests after the first, even if the subsequent requests have different values that should be used in the response.

If you configure parameter value substitution, the WebAccelerator system changes the targeted parameters value on the page served from the cache, so that the parameter you specify appears on the URL embedded in that page.

#### variation

Specifies the collection of variation rules. When the WebAccelerator system caches responses from the origin web server, it uses certain HTTP request parameters to create a Unique Content Identifier (UCI). The WebAccelerator system stores the UCI in the form of a compiled response and uses the UCI to easily match future requests to the correct content in its cache. You can configure variation rules to add or modify the parameters on which the WebAccelerator system bases its caching process. If the WebAccelerator system receives two requests that are identical except for the value of a query parameter defined in the variation rule, it creates a different UCI for each, and caches each response under its unique UCI. The following types of HTTP parameters are available for variation rules: host, query-param, unnamed-query-param, path-segment, cookie, user-agent, referrer, protocol, method, header, and client-ip.

#### viewstate-cache

Specifies, when enabled, that the WebAccelerator system accelerates requests and responses for Web form objects that are generated by ASP.NET web applications. Because the file size of forms can be significant, the WebAccelerator system is able to cache and substitute values, thus reducing the file size and achieving faster performance.

#### viewstate-cache-size

Specifies the size of the ViewState object cache in kilobytes. The default value is 100 kilobytes.

#### viewstate-tag

Specifies the name of the web form field where the ViewState object is stored. The default value is `__VIEWSTATE`.

**video-optimization-fast-start**  
Specifies when enabled, that the WebAccelerator system optimizes video by prefetching.

**video-optimization-max-bitrate**  
Specifies, the maximum bitrate of video that can be allowed in kilobits per sec. The default value is 0.

**video-optimization-insert-ad**  
Specifies, when enabled, that the WebAccelerator system can insert ad into the video.

**video-optimization-preroll-ad**  
Specifies, when enabled, that the WebAccelerator system can insert ad at the beginning of the video.

**video-optimization-ad-frequency**  
Specifies the frequency of ad insertion. Units in seconds.

**video-optimization-ad-policy**  
Specifies the ad policy applicable when processing the video.

**type** Displays the node type. The possible types are:

#### **branch**

The branch nodes exist only for the purpose of propagating rule parameters to leaf nodes. The WebAccelerator system does not perform matching against branch nodes. Branch nodes can have multiple leaf (child) nodes, as well as child branch nodes.

**leaf** A leaf node inherits rule parameters from its parent branch node. The WebAccelerator system performs matching only against leaf nodes, and then applies the leaf nodes corresponding acceleration rules to the request.

### **HTTP PARAMETERS**

Both matching and acceleration rules are identified by the type, and optionally, by the name of HTTP parameters that are used inside the rules. The following types of HTTP parameters are available:

#### **content-type**

A rule that uses the content-type parameter is based on type definitions in the object-type components. Unlike the HTTP request data types, a matching rule based on content type is specific to the content type parameter that the WebAccelerator system generates for a response. You specify the regular expression that you want a response's content type to match.

#### **client-ip**

A rule that uses the client IP parameter is based on the IP address of the client making the request. The IP address, however, may not always be the address of the client that originated the request. For example, if the client goes through a proxy server, the IP address is the IP address of the proxy server, rather than the client IP address that originated the request. If several clients use a specific proxy server, they all appear to come from the same IP address.

#### **cookie:[name]**

A rule that uses the cookie parameter is based on a particular cookie that you identify by name, and for which you provide a value to match against. This value is usually literal and must appear on the cookie in the request or in a regular expression that matches the request's cookie that appears on the cookie HTTP request headers. These are the same names you use to set the cookies, using the HTTP Set-Cookie response headers. The HTTP request can contain multiple cookies, and the rule identifier must include the name of the cookie separated with colon (:).

#### **extension**

A rule that uses the extension parameter is based on the value that follows the far-right period, in the far-right segment key of the URL path.

#### **header:[name]**

A rule that uses the header parameter is based on a particular header that you identify by name and for which you provide a value to match against. You can use an HTTP request data type header parameter to create rules based on any request header other than one of the recognized HTTP request data types. The HTTP request can contain multiple headers, and the rule identifier must include the name of the header separated with colon (:).

**host** A rule that uses the host parameter is based on the value provided for the HTTP Host request header field. This header field describes the DNS name that the HTTP request is using.

#### **method**

A rule that uses the method parameter is based on whether the request uses the GET or POST method.

#### **query-param:[name]**

A rule that uses the query parameter is based on a particular query parameter that you identify by name and for which you provide a value to match against. The value is usually literal and must appear on the query parameter in the request, or in a regular expression that matches the requests query parameter value. The query parameter can be in a request that uses GET or POST methods. The HTTP request can contain multiple query parameters, and the rule identifier must include the name of the header separated with colon (:).

**path** A rule that uses the path parameter is based on the path portion

of the URI. The path is defined as everything in the URL after the host and up to the end of the URL, or up to the question mark (whichever comes first).

**path-segment:[name]**

A segment is the portion of a URI path that is delimited by a forward slash (/). For example, in the path: /apps/search/full/complex.jsp, apps, search, full, and complex.jsp all represent path segments. The path can contain multiple segments so the rule identifier must include the name of the segment separated with colon (:). The name can be a segment ordinal or some other string to distinguish it from other segments rules in the same node.

**protocol**

A rule that uses the protocol parameter is based on whether the request uses the HTTP or HTTPS protocol.

**referrer**

A rule that uses the referrer parameter is based on the value provided for the HTTP Referer in the request header. (Note the misspelling of Referer. This spelling is defined for this request header in all versions of the HTTP specification.) This header provides the URL location that referred the client to the page that the client is requesting. You do not typically base rules on the Referer request header, unless you want your sites behavior to be dependent on the specific referrer. For example, one implementation would be for sites that provide different branding for their pages based on the user's web portal or search engine.

**unnamed-query-param:[name]**

An unnamed query parameter is a query parameter that has no equal sign. That is, only the query parameter value is provided in the URL of the request. The HTTP request may contain multiple unnamed query parameters so the rule identifier must include the name of it separated with colon (:). The name can be the ordinal of unnamed query parameter or some other string that can make it distinguishable from other unnamed query parameter rules in the same node.

**user-agent**

A rule that uses the user agent parameter is based on the value provided for the HTTP User-Agent in the request header, which identifies the browser that sent the request.

**RULE OPTIONS**

**active**

Specifies, when enabled, that the invalidation trigger rule is enabled. You can use this option to disable a specific invalidation trigger rule temporary, without removing it from the policy.

**arg-all**

Specifies, when enabled, that the rule matches all HTTP parameters of this type rather than one identified by arg-name or arg-ordinal. This option is applicable to variation rules query-param, unnamed-query-param, path-segment, cookie, and header. Such rules serve as a fallback case for defining document variation. All root nodes must include one variation rule of each type with this option enabled. The default value is disabled.

**arg-alias**

**src-alias**

**dst-alias**

**request-data-alias**

Specifies the user supplied alias for rules that use ordinals to identify HTTP request data. These include the unnamed-query-param and path-segment rules. The src-alias and dst-alias options are used in parameter value substitution rules to define aliases for the source and target definitions correspondingly. The request-data-alias option defines an alias for the invalidation trigger rules.

**arg-direction**

**src-direction**

**dst-direction**

**request-data-direction**

Specifies the direction that the WebAccelerator system uses to count the ordinal of path-segment. The src-direction and dst-direction options are used in parameter value substitution rules to define the ordinal direction for the source and target definitions correspondingly. The request-data-direction option defines the ordinal direction for the invalidation trigger rules. The default value is left-to-right. The possible values are:

**left-to-right**

The path segment is counted form left to right.

**right-to-left**

The path segment is counted form right to left.

**arg-name**

**src-name**

**dst-name**

**request-data-name**

Specifies the name of the parameter type for query-param, cookie, and header. If not specified, arg-name option is initialized from the rule name. This option is not effective if arg-all is enabled. The src-name and dst-dst options are used in parameter value substitution rules to define the parameter name for the source and target definitions correspondingly. The request-data-name option defines the parameter name for the invalidation trigger rules.

**arg-ordinal**

src-ordinal  
dst-ordinal  
request-data-ordinal

Specifies, in the form of a number, the location of a parameter for unnamed-query-param and path-segment rules. The numbering starts at 1 and follows the direction specified in the corresponding direction option. This option is not effective if arg-all is enabled. The src-ordinal and dst-ordinal options are used in parameter value substitution rules to define the parameter ordinal for the source and target definitions correspondingly. The request-data-ordinal option defines the parameter ordinal for the invalidation trigger rules.

broadcast

Specifies whether a triggered invalidation rule is broadcast to other members of a multibox deployment. This option is only effective when the application using this policy has multibox set to farm or symmetric.

cache-content

Specifies the parameter for which the WebAccelerator system must obtain fresh content when the invalidations rule is triggered. The available request types are: host, path, extension, query-param, unnamed-query-param, path-segment, cookie, user-agent, referrer, protocol, method, header, and client-ip.

Note: You must select and configure the path parameter for the cached content to invalidate, or the invalidations rule will fail to trigger. All other parameters are optional.

description

User-defined description of a rule.

dst-type

Specifies the HTTP parameter type to use as target definition for the request value substitution rule. A target definition contains a value in the embedded URL that you want the WebAccelerator system to replace with the value that you specified for the source definition, during assembly. The possible values are:

path-segment

Specifies that the WebAccelerator system targets the URL parameter, as specified by the dst-ordinal and dst-direction you define.

query-param

Specifies that the WebAccelerator system targets the URL parameter, as specified by the dst-name you define.

unnamed-query-param

Specifies that the WebAccelerator system substitutes the URL parameter, as specified by the dst-ordinal you define.

dst-urls

Specifies the collection of URLs in the request for which you want the WebAccelerator system to replace content.

request

Specifies a parameter in the request that triggers the invalidations rule. The available request types are: host, path, extension, query-param, unnamed-query-param, path-segment, cookie, user-agent, referrer, protocol, method, header, and client-ip.

Note: You must select and configure the path parameter for the request header criteria, or the invalidations rule will fail to trigger. All other parameters are optional.

request-data-type

Specifies the HTTP request parameter value that the WebAccelerator system should find in its cache and for which it should request updated content from the origin Web server. The default value is undefined.

The following types of HTTP parameters are available:

host  
query-param  
unnamed-query-param  
path-segment  
cookie  
user-agent  
referrer  
header  
client-ip

Specifies that the WebAccelerator system should use the corresponding value from the request that triggered the invalidation. Additional data, if required to identify the value, must be specified in the request-data-name, request-data-ordinal, and request-data-direction options. The values option is ignored.

undefined

Specifies that the WebAccelerator system should not use any values from the request that triggered the invalidation. You must add a value into the values option with which to compare the cached content.

src-type

Specifies the HTTP parameter type to use as source definition for the request value substitution rule. A source definition contains the value that the WebAccelerator system embeds in the URL, in place of the cached (target definition) value, during substitution. Typically, the source definition is a specific request element, such as a particular query parameter; however,

you can specify another source type, such as a random number. The possible values are:

**path-segment**

Specifies that the WebAccelerator system substitutes the URL parameter, as specified by the src-ordinal and src-direction options you define.

**query-param**

Specifies that the WebAccelerator system substitutes the URL parameter, as specified by the src-name option you define.

**randomizer**

Specifies that the WebAccelerator system generates a random number and places that number on the targeted location in an embedded URL.

**request-url**

Specifies that the WebAccelerator system is limited to target-specific URLs embedded in a page, as defined in the prefix that an embedded URL must match before the WebAccelerator system performs substitution. If you use the request URL as the source, the WebAccelerator system uses the entire request URL as the value to substitute.

**unnamed-query-param**

Specifies that the WebAccelerator system substitutes the URL parameter, as specified by the src-ordinal option you define.

**src-url**

Specifies whether the request URL is a relative URL or an absolute URL. The default value is absolute.

**value-case-sensitive**

Specifies, when enabled, that the HTTP parameter must be matched against supplied value(s) in case sensitive manner. The default value is no.

**values**

Values are a collection of rule parameters that enable you to specify different parameter values for the same rule. Most rules allow only one value, while variation rules support multiple values. Each value can prompt a different behavior by the WebAccelerator system. All variation rules must include at least one value with match-all option enabled. A value can be represented by actual string, regex, or multiple strings, or regexes separated by space ( ).

**RULE VALUE OPTIONS**

**can-be-empty**

Specifies, when enabled, that the defined HTTP request parameter is included in the request, but has no value (is an empty string). The default value is no.

**can-be-missing**

Specifies, when enabled, that the defined HTTP request parameter is absent from the request. The default value is no.

**invert-match**

Specifies, when enabled, that the defined HTTP request parameter does not match the associated regular expression that you defined. The default value is no.

**match-all**

Specifies, when enabled, that the defined HTTP request parameter matches all possible values. This option is available only for variation rule values as a fallback case. Each variation rule must have at least one value with this option enabled. The default value is no.

**cache-as**

Specifies whether the associated value should prompt the WebAccelerator system to reply to matched requests with the same or different content. This option is available only for variation rule values.

## wam resource concat-set

**NAME**  
concat-set - Configures concatenation sets for WebAccelerator for use in JavaScript/CSS concatenation

**MODULE**  
wam resource

**SYNTAX**  
Configure the concat-set within the wam resource module using the syntax shown in the following sections.

**CREATE/MODIFY**  
create concat-set [name]  
modify concat-set [name]  
options:  
app-service [[string] | none]  
url [url]  
type [css|js]  
members [string ] ...

**DISPLAY**  
list concat-set [name ...]

**DELETE**  
delete concat-set [name ...]

**DESCRIPTION**  
You can use the concat-set component to manage the concatenation sets used by the WebAccelerator JavaScript and CSS concatenation feature. A concatenation set must be created, then enabled and activated in the configuration on a WebAccelerator policy node.

**EXAMPLES**  
create concat-set testSet url http://www.example.com/concatSet.css type css  
css  
Creates a set whose URL will be http://www.example.com/concatSet.css for use in concatenation.  
list concat-set testSet  
Displays properties of the concatenation set named testSet.  
delete concat-set testSet  
Deletes concatenation set named testSet.

**OPTIONS**  
app-service  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.  
url  
Specifies the URL that will be used to generate the concatenated link.  
type  
Either "css" or "js". Specifies whether the set is to be used for CSS or JavaScript concatenation.  
members  
Specifies the members of this set. The set members are the URL resources that are defined by the wam resource url.

**SEE ALSO**  
create, delete, edit, list, modify, tmsh

**COPYRIGHT**

## wam resource domain-list

**NAME**

domain-list - Configures a list of domains for WebAccelerator for use in inserting DNS prefetch tags.

#### MODULE

wam resource

#### SYNTAX

Configure the domain-list component within the wam resource module using the syntax shown in the following sections.

##### CREATE/MODIFY

```
create domain-list [name]
modify domain-list [name]
options:
  app-service [[string] | none]
  description [[string] | none]
  domains
    [add | delete | none | replace-all-with] {
      [string] ...
    }
}
```

##### DISPLAY

```
list domain-list [name ...]
```

##### DELETE

```
delete domain-list [name ...]
```

#### DESCRIPTION

You can use the domain-list component to manage the domain list resources used by the WebAccelerator DNS prefetching feature. A domain-list must be created, then added to the appropriate domain-lists on a WebAccelerator policy node in order for the domains within the domain list to be inserted into a document.

#### EXAMPLES

```
create domain-list my_domain_list domains add {example.com
example2.com}
```

Creates a domain list resource for the domains example.com and example2.com for use in inserting DNS prefetch tags.

```
list domain-list my_domain_list
```

Displays properties of the domain-list resource named my\_domain\_list.

```
delete domain-list my_domain_list
```

Deletes the domain-list resource named my\_domain\_list.

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**description**  
User defined description.

**domains**  
Specifies the domains described by the domain list resource.

#### SEE ALSO

create, delete, edit, list, modify, show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## wam resource url

#### NAME

url - Configures a URL resource for WebAccelerator for use in reordering whitelists

#### MODULE

wam resource

#### SYNTAX

Configure the url component within the wam resource module using the syntax shown in the following sections.

```
CREATE/MODIFY
create url [name]
modify url [name]
options:
  app-service [[string] | none]
  url [url]
  type [css|js]
```

```
DISPLAY
list url [name ...]
```

```
DELETE
delete url [name ...]
```

#### DESCRIPTION

You can use the url component to manage the URL resources used by the WebAccelerator JavaScript and CSS reordering features. A URL resource must be created, then added to the appropriate whitelist on a WebAccelerator policy node in order for the corresponding URL to be reordered.

#### EXAMPLES

```
create url test.css url http://www.example.com/test.css type css
```

Creates a URL resource for the URL http://www.example.com/test.css for use in CSS reordering whitelists.

```
list url test.css
```

Displays properties of the URL resource named test.css.

```
delete url test.css
```

Deletes the URL resource named test.css.

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**url** Specifies the URL described by the URL resource.

**type** Either "css" or "js". Specifies whether the URL resource is to be used for CSS or JavaScript reordering.

#### SEE ALSO

create, delete, edit, list, modify, show, tmsh

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2011-2013. All rights reserved.

## wam roi-statistics

**NAME**  
roi-statistics - Provides ROI statistics for WAM application.

**MODULE**  
wam

**SYNTAX**  
Provides ROI statistics for configured application within the wam module.

```
DISPLAY
show roi-statistics
show roi-statistics [application-name]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
```

#### DESCRIPTION

You can use the roi-statistics component to view the ROI statistics of configured WAM application.

#### EXAMPLES

```
show roi-statistics my_application
```

The show command will display ROI statistics for the configured WAM application.

#### SEE ALSO

```
show, tmsh
```

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

F5 Networks and BIG-IP (c) Copyright 2011-2014. All rights reserved.

## WOM

### wom advertised-route

#### NAME

advertised-route - Configures a route advertised by the local endpoint to remote endpoints for WAN optimization.

#### MODULE

wom

#### SYNTAX

Configure the advertised-route component within the wom module using the syntax in the following sections.

#### CREATE/MODIFY

```
create advertised-route [name]
modify advertised-route [name | all]
options:
  app-service [[string] | none]
  description [string]
  dest [ip address/netmask]
  include [disabled | enabled]
  label [value]
  metric [integer]
  origin [configured | discovered | manually-saved | persistable]
```

#### DISPLAY

```
list advertised-route
show advertised-route
options:
  all
  all-properties
  app-service
  running-config
  non-default properties
  one-line
```

#### DELETE

```
delete advertised-route [name]
```

#### DESCRIPTION

You can use the advertised-route component to configure a subnet that the system can reach through the local endpoint. You can specify a netmask or use slash format.

Routes are advertised to all connected WAN Optimization Managers. The remote endpoints use the subnet configuration information to determine peer routing and optimization actions.

#### EXAMPLES

```
list advertised-route all
```

Displays all endpoint advertised routes for the local WAN Optimization Manager.

```
delete advertised-route adv_rt2
```

Deletes the advertised route adv\_rt2.

#### OPTIONS

**app-service**  
Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application

service can modify or delete the object.

**description**  
User defined description.

**dest** Specifies the IP address and netmask of the advertised route.

**include**  
Enables or disables the inclusion of this route in the optimization of traffic. This option allows you to define a subset of IP addresses to exclude from optimization within a larger included subnet. An excluded endpoint advertised route must be a valid address range subset of an included endpoint advertised route. The default is enabled.

**label**  
Specifies an optional descriptive label for this route.

**metric**  
Specifies a routing number to select between WAN Optimization Manager pairs. The higher the number, the more expensive the route in terms of resources. Not currently implemented.

**origin**  
Specifies whether the route was discovered automatically or configured manually. You can change the origin from discovered to persistable, if you want to save the route to the file `bigip_local.conf` when you use the command `save config`. After you run the command `save config`, this attribute changes to manually saved. Endpoints that have the attribute discovered are not saved to the file `bigip_local.conf`.

The options are:

**configured**  
Indicates that you manually configured this route. The system automatically sets this value, and you cannot change it.

**discovered**  
Indicates that the system automatically discovered this route. Note that route for which the value of the origin property is discovered are not saved to the file `bigip_local.conf`.

**manually-saved**  
After you run the command `save / sys config`, the value of the origin property that was set to persistable changes to manually-saved. Note that after the system changes the value to manually-saved, you cannot change it again.

**persistable**  
Change the origin from discovered to persistable, if you want to save the route to the file `bigip_local.conf` when you use the command `save / sys config`.

#### SEE ALSO

`create`, `delete`, `list`, `wom local-endpoint`, `modify`, `wom remote-endpoint`, `wom server-discovery`, `show`, `tms`

#### COPYRIGHT

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## wom deduplication

**NAME**  
`deduplication` - Configures symmetric data deduplication for WAN optimization.

**MODULE**  
`wom`

**SYNTAX**  
Configure the deduplication component within the `wom` module using the syntax in the following sections.

**MODIFY**  
`modify deduplication`  
**options:**  
`codec [sdd-v2 | sdd-v3]`

[disabled | enabled]  
max-endpoint-count [integer]

#### DISPLAY

list deduplication  
show running-config deduplication  
options:  
dictionary-size  
one-line

#### DESCRIPTION

You can use the deduplication component to configure symmetric data deduplication, which compresses data over the WAN by identifying and removing repetitive data patterns.

#### EXAMPLES

list deduplication

Displays all the deduplication settings.

modify deduplication max-endpoint-count 4

Sets the maximum number of remote endpoints to 4.

#### OPTIONS

codec

Specifies which algorithm the system uses for deduplication.

The options are:

sdd-v2

Used for low number of spokes, such as for data center to data center replication.

sdd-v3

Used for high number of spokes, such as for connecting multiple remote sites or mesh topologies.

dictionary-size

Displays the current size of the dictionary, which deduplication uses to look up byte patterns.

[disabled | enabled]

Enables or disables deduplication. The default value is enabled. Note that if you enable or disable deduplication, you must then restart the BIG-IP WOM system using bigstart restart, or the change takes effect the next time the BIG-IP device reboots.

max-endpoint-count

Specifies the maximum number of concurrent remote endpoints supported by symmetric data deduplication. For codec sdd-v3, the system sets the value at 128.

#### SEE ALSO

## wom endpoint-discovery

**NAME**  
endpoint-discovery - Configures automatic discovery of remote endpoints for WAN optimization.

**MODULE**  
wom

**SYNTAX**  
Configure the endpoint-discovery component with the wom module using the syntax in the following sections.

**MODIFY**  
modify endpoint-discovery  
options:  
auto-save [disabled | enabled]  
description [string]  
discoverable [disabled | enabled]  
discovered-endpoint [disabled | enabled]  
icmp-max-requests [integer]  
icmp-min-backoff [integer]  
icmp-num-retries [integer]  
max-endpoint-count [integer]  
mode [disable | enable-all | enable-icmp | enable-tcp]

reset-stats endpoint-discovery

**DISPLAY**  
list endpoint-discovery  
show running-config endpoint-discovery  
options:  
all-properties  
non-default-properties  
one-line

show endpoint-discovery  
options:  
(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DESCRIPTION**  
You can use the endpoint-discovery component to specify parameters for automatically discovering remote endpoints for WAN optimization. These endpoints are configured WAN Optimization Managers on remote BIG-IP(r) systems that advertise themselves to the configured WAN Optimization Manager on the local BIG-IP system.

**EXAMPLES**  
modify endpoint-discovery max-endpoint-count 10

Limits the number of remote endpoints that can be discovered to ten. After discovering ten remote endpoints, the WOM stops sending probe messages.

list endpoint-discovery all-properties

Displays the configuration parameters for the discovery of remote endpoints.

**OPTIONS**

**auto-save**  
Specifies whether the system automatically saves remote endpoints that it discovers. The default value is enabled.

**description**  
User defined description.

**discoverable**  
Specifies whether the WAN Optimization Manager responds to probe messages it receives from WAN Optimization Managers on remote BIG-IP systems. The default value is enabled.

**discovered-endpoint**  
Specifies whether the WAN Optimization Manager sends out probe messages to discover other WAN Optimization Managers on remote BIG-IP systems in the network. The default value is enabled.

**icmp-max-requests**

Specifies the maximum number of ICMP probe message requests, after which the system stops sending probe message requests until at least one message is cleared from the queue by either a timeout or a response. The default value is 1024.

**icmp-min-backoff**

Specifies the maximum number of seconds to wait before abandoning an ICMP probe message request and resending it. The range is from 0 to 255. The default value is 5.

**icmp-num-retries**

Specifies the maximum number of times the system sends an ICMP probe message request for a single flow. The range is from 0 to 255. The default value is 10.

**max-endpoint-count**

Specifies the highest number of endpoints for the system to discover before it stops sending probe messages. The range is from 0 to 255. The default value is 0, which indicates no limit.

**mode** Specifies the type of probe messages the system should send. The default value is `enable-all`.

The options are:

**disable**

Turns off probe messages.

**enable-icmp**

Sends only ICMP probe messages.

**enable-tcp**

Sends only TCP probe messages.

**enable-all**

Sends both ICMP and TCP probe messages.

**SEE ALSO**

`list`, `modify`, `show`, `tmsh`, `wom local-endpoint`, `wom remote-endpoint`, `wom server-discovery`

## wom local-endpoint

**NAME**

`local-endpoint` - Configures the local endpoint for the WAN Optimization Manager.

**MODULE**

wom

**SYNTAX**

Configure the local-endpoint component within the wom module using the following syntax.

**CREATE/MODIFY**

`create local-endpoint`

`modify local-endpoint`

**options:**

`addresses [add | delete | replace-all-with] {  
[ip address]`

`}`

`addresses none`

`allow-nat [disabled | enabled]`

`description [string]`

`endpoint [disabled | enabled]`

`internal-forwarding [disabled | enabled]`

`ip-encap-mtu [unsigned integer]`

`ip-encap-profile [none | profile name]`

`ip-encap-type [gre | ipip | ipsec | none]`

`no-route [drop | passthru]`

`server-ssl [none | profile name]`

`snat [local | none | remote]`

`tunnel-port [unsigned integer]`

**DISPLAY**

`list local-endpoint`

```
show local-endpoint
show running-config local-endpoint
options:
  all-properties
  non-default-properties
  one-line
```

```
DELETE
delete local-endpoint
```

#### DESCRIPTION

You can use the local-endpoint component to modify the settings for the local endpoint for the WAN Optimization Manager on the local BIG-IP(r) system.

#### EXAMPLES

```
modify local-endpoint allow-nat disabled
```

Disables the allow-nat option, specifying that the system does not accept connections for traffic behind a Network Address Translation (NAT) device.

```
list local-endpoint all-properties
```

Displays all of the properties of the local-endpoint component.

#### OPTIONS

##### addresses

Specifies a single IP address the system uses for the local endpoint. The IP address must be in the same subnet as a self IP address on the BIG-IP(r) system.

##### allow-nat

When enabled, specifies that the system accepts connections for traffic behind a Network Address Translation device. The default value is enabled.

##### description

User defined description.

##### endpoint

When enabled, specifies that the local endpoint is available for initiating and receiving optimized traffic. The default value is enabled.

To turn off WAN optimization on this endpoint, use disabled.

##### internal-forwarding

When enabled, specifies that the local endpoint is available for forwarding internal traffic to remote endpoints. The default value is disabled.

This parameter works only if internal-forwarding for remote-endpoint is set to default.

##### ip-encap-mtu

Specifies the maximum transfer unit for IP encapsulated traffic.

##### ip-encap-profile

Specifies the name of the profile with the encapsulation settings. This profile must be of the type specified for the setting ip-encap-type.

##### ip-encap-type

Specifies the type of IP layer encapsulation to perform on iSession(tm) traffic.

The default value is none. The options are:

**gre** The system uses the Generic Routing Encapsulation (GRE) tunneling protocol.

**ipip** The system uses the IP over IP (IPIP) tunneling protocol.

##### ipsec

The system uses IP security (IPsec) encapsulation.

**none** No IP encapsulation takes place.

##### no-route

Specifies what the system does with traffic for which there is no remote endpoint to complete the iSession connection.

The default value is passthru. The options are:

**drop** The system terminates the traffic flow.

##### passthru

The traffic flow continues without an iSession connection.

##### server-ssl

Specifies the default server SSL profile the system uses for all encrypted outbound connections. The default value is none.

**snat** Specifies the IP address the system uses for incoming traffic as the source IP address of the TCP connection between the WAN Optimization Manager and the server.

The default value is none. The options are:

##### local

The system uses the endpoint IP address closest to the destination. Use this setting to make sure the return route also goes through the BIG-IP system, so that both sides of

the connection can be optimized. This setting is useful if responses returning from the server to the client would not normally pass through the BIG-IP system.

none The system uses the original connecting client IP address.

remote

The system uses the source IP address of the incoming iSession connection. Use this setting when an appliance that uses NAT is located between the WAN Optimization endpoints.

tunnel-port

Specifies the number of the port on the local endpoint that the WAN Optimization Manager uses for control connections. The port must have access through the firewall. The range is from 1 to 65535. The default value is 443.

SEE ALSO

## wom profile cifs

NAME

cifs - Configures a Common Internet File System (CIFS) profile.

MODULE

wom profile

SYNTAX

Configure the cifs component within the wom profile module using the syntax shown in the following sections.

CREATE/MODIFY

create cifs [name]

modify cifs [name]

options:

app-service [[string] | none]

defaults-from [ [name] | none]

description [string]

fast-close [disabled | enabled]

fast-set-file-info [disabled | enabled]

office-2003-extended [disabled | enabled]

read-ahead [disabled | enabled]

record-replay [disabled | enabled]

write-behind [disabled | enabled]

DISPLAY

list cifs

list cifs [ [ [name] | [glob] | [regex] ] ... ]

show running-config cifs

show running-config cifs [ [ [name] | [glob] | [regex] ] ... ]

options:

all-properties

app-service

non-default-properties

one-line

partition

show cifs

show cifs [ [ [name] | [glob] | [regex] ] ... ]

options:

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

DELETE

delete cifs [name]

DESCRIPTION

You can use the cifs component to manage a CIFS profile.

EXAMPLES

create cifs my\_cifs\_profile

Creates a CIFS profile named my\_cifs\_profile using the system defaults.

modify cifs my\_cifs\_profile fast-close disabled

Turns off fast-close for the CIFS profile named my\_cifs\_profile.

#### OPTIONS

##### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

##### defaults-from

Specifies the profile that you want to use as the parent profile. The new profile inherits all settings and values from the parent profile specified. The default value is cifs.

##### description

User defined description.

##### fast-close

Specifies whether the system speeds up file close operations by fulfilling them through the WAN Optimization Manager closer to the request initiator. The default value is enabled.

##### fast-set-file-info

Specifies whether the system speeds up file metadata change requests by fulfilling the requests through the WAN Optimization Manager closer to the request initiator. The default value is enabled.

glob Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

name Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

##### office-2003-extended

Specifies whether the system performs read-ahead operations based on parsing the Microsoft CDF file and understanding its structure. The default value is enabled.

##### partition

Displays the administrative partition within which the component resides.

##### read-ahead

Specifies whether the system speeds up CIFS file downloads by prefetching the file data on the WAN Optimization Manager closer to the request initiator. The default value is enabled.

##### record-replay

Specifies whether the system opens CIFS files faster by performing more intelligent read-ahead operations. The default value is enabled.

##### regex

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

##### write-behind

Specifies whether the system speeds up CIFS file uploads to the server by fulfilling write requests through the WAN Optimization Manager closer to the request initiator. The default value is enabled.

#### SEE ALSO

create, delete, glob, list, ltm virtual, modify, regex, show, tmsh

## wom profile isession

#### NAME

isession - Configures an iSession profile.

#### MODULE

wom profile

## SYNTAX

Configure the iSession component within the wom profile module using the following syntax.

### CREATE/MODIFY

```
create isession [name]
modify isession [name]
options:
  adaptive-compression [disabled | enabled]
  app-service [[string] | none]
  compression [disabled | enabled]
  compression-codecs [add | delete | none | replace-all-with] {
    options:
      bzip2
      deflate
      lzo
  }
  data-encryption [disabled | enabled]
  deduplication [disabled | enabled]
  defaults-from [ [name] | none]
  deflate-compression-level [integer]
  description [string]
  mode [disabled | enabled]
  port-transparency [disabled | enabled]
  reuse-connection [disabled | enabled]
  target-virtual [none | host-match-all | host-match-no-isession | virtual-match-all]

reset-stats isession
reset-stats isession [ [ [name] | [blog] | [regex] ] ... ]
```

### DISPLAY

```
list isession
list isession [ [ [name] | [glob] | [regex] ] ... ]
show running-config isession
show running-config isession [ [ [name] | [glob] | [regex] ] ... ]
options:
  all-properties
  app-service
  non-default-properties
  one-line
  partition

show isession
show isession [ [ [name] | [glob] | [regex] ] ... ]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
  field-fmt
  global
```

### DELETE

```
delete isession [name]
```

## DESCRIPTION

You can use the iSession component to manage an iSession profile.

## EXAMPLES

```
create isession my_isession_profile defaults-from isession
```

Creates an iSession profile named my\_isession\_profile using the system defaults.

```
modify isession my_isession_profile deduplication disabled
```

Turns off deduplication for the iSession profile named my\_isession\_profile.

## OPTIONS

### adaptive-compression

Enables or disables the automatic selection of the optimal compression algorithm for the current traffic, based on link speed. The system can use only compression algorithms that are specified. The default value is enabled.

### app-service

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

### compression

Enables or disables the compression of data according to the methods you select for the attribute compression-codecs. The default value is enabled.

### compression-codecs

Specifies the codecs to use for compression. The following codecs are available:

#### bzip2

Specifies the use of the bzip2 compression algorithm, which improves compression ratios on low-bandwidth data links.

#### deflate

Specifies the use of the Deflate data compression algorithm.

#### lzo

Specifies the use of the Lempel-Ziv-Oberhumer (LZO) data compression algorithm.

### data-encryption

Enables or disables encryption of the traffic on the outbound connection. If you select enabled, the system uses the SSL profiles specified on the local and remote endpoints of the

iSession connection. The default value is disabled.

**deduplication**

Enables or disables data deduplication, which replaces previously transmitted data with references, thus reducing the amount of bandwidth needed to transfer data over the WAN. The default value is enabled.

**defaults-from**

Specifies the profile that you want to use as the parent profile. The new profile inherits all settings and values from the parent profile specified. The default value is isession.

**deflate-compression-level**

Specifies the level of compression, if deflate-compression is specified and adaptive-compression is disabled. The range is 1 to 9. A higher value causes the CPU to spend more time looking for matches, which may result in better compression. The default value is 1.

**description**

User defined description.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**mode** Enables or disables the use of this profile for WAN optimization traffic. The default value is enabled.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**partition**

Displays the administrative partition within which the component resides.

**port-transparency**

Enables or disables the preservation of the destination port specified by the client over the WAN. The default value is enabled.

**regex**

Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**reuse-connection**

Enables or disables the saving and reuse of connections between the local and remote WAN Optimization Managers. The default value is enabled.

**target-virtual**

For terminated iSession traffic, specifies the matching criteria that a client-side BIG-IP system uses to select a target virtual server on the server-side BIG-IP system.

The default value is virtual-match-all. The options are:

**none** Specifies that the system sends the terminated iSession traffic directly to the server.

**host-match-all**

Specifies that the system selects the closest match from all the host virtual servers.

**host-match-no-isession**

Specifies that the system matches only host virtual servers with no iSession profile.

**virtual-match-all**

Specifies that the system selects the closest match from all the virtual servers.

**SEE ALSO**

create, delete, glob, list, ltm virtual, modify, regex, reset-stats, show, tmsh, wom local-endpoint, wom remote-endpoint

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

BIG-IP 2012-05-22 wom profile isession(1)

**NAME**  
 mapi - Configures a Messaging Application Program Interface (MAPI) profile.

**MODULE**  
 wom profile

**SYNTAX**  
 Configure the mapi component within the wom profile module using the following syntax.

**CREATE/MODIFY**  
 create mapi [name]  
 modify mapi [name]  
 options:  
 app-service [[string] | none]  
 defaults-from [ [name] | none]  
 description [string]  
 discover-exchange-servers [disabled | enabled]  
 native-compression [disabled | enabled]

**DISPLAY**  
 list mapi  
 list mapi [ [ [name] | [glob] | [regex] ] ... ]  
 show running-config mapi  
 show running-config mapi [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
 all-properties  
 app-service  
 non-default-properties  
 one-line  
 partition

show mapi  
 show mapi [ [ [name] | [glob] | [regex] ] ... ]  
 options:  
 (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)

**DELETE**  
 delete mapi [name]

**DESCRIPTION**  
 You can use the mapi component to manage a MAPI profile.

**EXAMPLES**  
 create mapi my\_mapi\_profile  
 Creates a MAPI profile named my\_mapi\_profile using the system defaults.  
 modify mapi my\_mapi\_profile native-compression enabled  
 Turns on native-compression for the MAPI profile named my\_mapi\_profile.

**OPTIONS**

**app-service**  
 Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**defaults-from**  
 Specifies the profile that you want to use as the parent profile. The new profile inherits all settings and values from the parent profile specified. The default value is mapi.

**description**  
 User defined description.

**discover-exchange-servers**  
 Enables or disables the automatic discovery of the Microsoft Exchange servers in the network and creation of a virtual server for each one discovered. The default value is disabled.

**glob** Displays the items that match the glob expression. See help glob for a description of glob expression syntax.

**name** Specifies a unique name for the component. This option is required for the commands create, delete, and modify.

**native-compression**  
 Enables or disables native Microsoft Exchange compression. The default value is disabled.

**partition**  
 Displays the administrative partition within which the component resides.

**regex**  
 Displays the items that match the regular expression. The regular expression must be preceded by an at sign (@[regular expression]) to indicate that the identifier is a regular expression. See help regex for a description of regular expression syntax.

**SEE ALSO**  
 create, delete, glob, list, ltm virtual, modify, regex, show, tmsh

BIG-IP 2012-05-22 wom profile mapi(1)

---

## wom remote-endpoint

### NAME

remote-endpoint - Configures one or more remote endpoints for the WAN Optimization Manager.

### MODULE

wom

### SYNTAX

Configure the remote-endpoint component within the wom module using the following syntax.

#### CREATE/MODIFY

```
create remote-endpoint [name]
modify remote-endpoint [name]
options:
  address [ip address]
  allow-routing [disabled | enabled]
  app-service [[string] | none]
  dedup-action [none | cache-refresh]
  description [string]
  endpoint [disabled | enabled]
  internal-forwarding [default | disabled | enabled]
  ip-encap-mtu [unsigned integer]
  ip-encap-profile [none | profile name]
  ip-encap-type [default | gre | ipip | ipsec | none]
  origin [configured | discovered | manually-saved | persistable]
  server-ssl [none | profile name]
  snat [default | local | none | remote]
  tunnel-encrypt [disabled | enabled]
  tunnel-port [unsigned integer]
reset-stats remote-endpoint
```

#### DISPLAY

```
list remote-endpoint
list remote-endpoint [name]
show running-config remote-endpoint
show running-config remote-endpoint [name]
options:
  all-properties
  dedup-codec
  non-default-properties
  one-line

show remote-endpoint
show remote-endpoint [name]
options:
  (default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)
```

#### DELETE

```
delete remote-endpoint [name]
```

Note: If you delete a remote endpoint without also disabling the endpoint-discovery component, the remote endpoint may reappear as it is rediscovered. To remove a remote endpoint from traffic initiated by this WAN Optimization Manager, set the endpoint option of the remote-endpoint component to disabled.

### DESCRIPTION

You can use the remote-endpoint component to create, modify, or delete a remote endpoint for traffic from the local WAN Optimization Manager.

### EXAMPLES

```
modify remote-endpoint 13.16.0.5 endpoint disabled
```

Disables the WAN optimization connection to the remote endpoint that is named 13.16.0.5.

```
list remote-endpoint all-properties
```

Displays all the properties of all the remote endpoints for traffic from the local WAN Optimization Manager.

### OPTIONS

**allow-routing**  
Specifies whether there is a route from the local endpoint to this remote endpoint through which the local endpoint can establish connections. The default value is enabled.

**address**

Specifies the IP address of the remote endpoint.

**app-service**

Specifies the name of the application service to which the object belongs. The default value is none. Note: If the strict-updates option is enabled on the application service that owns the object, you cannot modify or delete the object. Only the application service can modify or delete the object.

**description**

User defined description.

**dedup-action**

Clears the cache used for symmetric data deduplication on the specified remote endpoint and immediately resets the value to none.

**dedup-codec**

Displays the deduplication codec used by the remote endpoint: `sdd-v2` or `sdd-v3`.

**endpoint**

When enabled, specifies that traffic can be optimized between the local and remote endpoints. The default value is enabled.

Note: Disabling a remote endpoint affects only the connection between the local endpoint and this remote endpoint.

**internal-forwarding**

When enabled, specifies that the remote endpoint is available for forwarding internal traffic.

When disabled, specifies that the remote endpoint is NOT available for forwarding internal traffic.

When default, specifies that forwarding internal traffic is managed by the `local-endpoint.internal-forwarding` setting.

The default value is default.

**ip-encap-mtu**

Specifies the maximum transfer unit for IP encapsulated traffic. The default value is 0.

**ip-encap-profile**

Specifies the name of a profile with encapsulation settings. This profile must be of the type specified for the setting `ip-encap-type`.

**ip-encap-type**

Specifies the type of IP layer encapsulation performed on iSession traffic.

The default value is default. The options are:

**default**

The system uses the `ip-encap-type` value set for the local endpoint.

**gre** The system uses the Generic Routing Encapsulation (GRE) tunneling protocol.

**ipip** The system uses the IP over IP (IPIP) tunneling protocol.

**ipsec**

The system uses IP security (IPsec) encapsulation.

**none** No IP encapsulation takes place.

**origin**

Specifies whether the remote endpoint was discovered automatically or configured manually.

The options are:

**configured**

Indicates that you manually configured this remote endpoint. The system automatically sets this value, and you cannot change it.

**discovered**

Indicates that the system automatically discovered this remote endpoint. Note that endpoints for which the value of the `origin` property is discovered are not saved to the file `bigip_local.conf`.

**manually-saved**

After you run the command `save / sys config`, the value of the `origin` property that was set to `persistable` changes to `manually-saved`. Note that after the system changes the value to `manually-saved`, you cannot change it again.

**persistable**

Change the `origin` from `discovered` to `persistable`, if you want to save the endpoint to the file `bigip_local.conf` when you use the command `save / sys config`.

**server-ssl**

Specifies the server SSL profile the system uses to connect to this remote endpoint. This setting overrides the `server-ssl` setting for the local-endpoint component. The default value is none.

**snat** Specifies the IP address the system uses as the source IP address

of the TCP connection between the WAN Optimization Manager and the server.

The default value is default. The options are:

**default**

The system uses the snat value set for the local-endpoint component.

**local**

The system uses the endpoint IP address closest to the destination. Use this setting to make sure the return route also goes through the BIG-IP system, so that both sides of the connection can be optimized. This setting is useful if responses returning from the server to the client would not normally pass through the BIG-IP system.

**none** The system uses the original connecting client IP address.

**remote**

The system uses the source IP address of the incoming iSession connection. Use this setting when an appliance that uses NAT is located between the WAN Optimization Manager endpoints.

**tunnel-encrypt**

Enables or disables encryption of traffic passing between the two WAN Optimization Managers. The default value is enabled

**tunnel-port**

Specifies whether to use a specific port for traffic optimized to this endpoint or to use port transparency (0). The default value is 443.

**SEE ALSO**

create, delete, list, modify, show, tmsh, wom advertised-route, wom local-endpoint

**COPYRIGHT**

No part of this program may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying, recording, or information storage and retrieval systems, for any purpose other than the purchaser's personal use, without the express written permission of F5 Networks, Inc.

## wom remote-route

**NAME**

remote-route - Displays the destination routes learned from the remote endpoints.

**MODULE**

wom

**SYNTAX**

Display the remote-route component within the wom module using the syntax in the following section.

**DISPLAY**

show remote-route

options:

(default | exa | gig | kil | meg | peta | raw | tera | yotta | zetta)  
detail

**DESCRIPTION**

You can use the remote-route component to view the subnets that the system can reach through the remote endpoint(s). The system can optimize traffic destined for these subnets.

**EXAMPLES**

show remote-route

Displays the subnets reachable through the remote endpoint(s) configured on the WAN Optimization Manager.

show remote-route detail

Displays detailed information about the remote endpoint(s) through which the displayed subnets can be reached.

**SEE ALSO**

show, tmsh, wom advertised-route, wom remote-endpoint, wom server-discovery,

## wom server-discovery

### NAME

server-discovery - Configures the dynamic discovery of servers that can be reached through the local endpoint and the routes to reach them.

### MODULE

wom

### SYNTAX

Configure the server-discovery component within the wom module using the syntax in the following sections.

#### MODIFY

modify server-discovery

##### options:

```
auto-save [disabled | enabled]
description [string]
filter-mode [exclude | include]
idle-time-limit [integer]
ip-ttl-limit [integer]
max-server-count [integer]
min-idle-time [integer]
min-prefix-length-ipv4 [integer]
min-prefix-length-ipv6 [integer]
mode [disabled | enabled]
rtt-threshold [integer]
subnet-filter [add | delete | none | replace-all-with] {
    [ip address]
}
time-unit [days | hours | minutes]
```

#### DISPLAY

list server-discovery

show running-config server-discovery

##### options:

```
all-properties
auto-save
current-module
description
filter-mode
idle-time-limit
ip-ttl-limit
max-server-count
min-idle-time
min-prefix-length-ipv4
min-prefix-length-ipv6
mode
non-default-properties
one-line
rtt-threshold
subnet-filter
time-unit
```

### DESCRIPTION

You can use the server-discovery component to configure the dynamic discovery of servers and the routes to reach them through the local endpoint. The local endpoint advertises these routes to any remote endpoints to which it is connected.

### EXAMPLES

```
list server-discovery all-properties
```

Displays the settings for dynamic discovery of advertised routes.

```
modify server-discovery mode disabled
```

Disables the dynamic discovery of advertised routes.

### OPTIONS

#### auto-save

Specifies whether the system automatically saves the subnets that it discovers that can be reached through the local endpoint. The default value is enabled.

**description**  
User defined description.

**filter-mode**  
Specifies whether the subnets you add using the attribute `subnet-filter` are excluded from or included in the discovery of advertised routes. If you specify `include`, and do not specify any IP addresses, no subnets are discovered. The default is `exclude` with no IP addresses specified, which means that all advertised routes that conform to the specified attributes are discovered.

**idle-time-limit**  
Specifies the maximum length of time a route can be idle without being removed from discovery. The default value is 0. Use the attribute `time-unit` to set the unit of measure. Use the attribute `min-idle-time` to set the minimum length of idle time.

**ip-ttl-limit**  
Specifies the number of network segments on which a packet is allowed to travel before the route is removed from discovery. The more routers a packet travels through, the smaller the `ip ttl` value is. The range is 0 to 255. The default value is 5.

**max-server-count**  
Specifies the highest number of servers the system discovers before it stops looking. The default value is 50.

**min-idle-time**  
Specifies the minimum length of time a route must be idle before being removed from discovery. The default value is 0, which indicates that idle time is not considered in discovery. Use the attribute `time-unit` to set the unit of measure. Use the attribute `idle-time-limit` to set the maximum length of idle time.

**min-prefix-length-ipv4**  
Specifies the minimum prefix length for route aggregation in IPV4 networks. The range is 0 to 32. The default value is 32.

**min-prefix-length-ipv6**  
Specifies the minimum prefix length for route aggregation in IPV6 networks. The range is 0 to 128. The default value is 128.

**mode** Enables or disables the dynamic discovery of servers that can be reached through the local endpoint. For server discovery to take place, the setting `mode` of the component `wom endpoint-discovery` must not be set to disabled.

**rtt-threshold**  
Specifies that the system does not add servers it discovers with a round-trip time greater than this value, in milliseconds. The default value is 10.

**subnet-filter**  
Specifies the IP addresses of the subnets to include in or exclude from the discovery of advertised routes, depending on the setting you selected for the attribute `filter-mode`. The default is none. If you selected `include` for the attribute `filter-mode`, and do not specify any IP addresses, no subnets are discovered.

**time-unit**  
Specifies the unit of measure (days, hours, or minutes) for the length of idle time specified using the attributes `idle-time-limit` and `min-idle-time`.

**SEE ALSO**

`list`, `modify`, `show`, `tms`, `wom advertised-route`, `wom endpoint-discovery`, `wom local-endpoint`, `wom remote-route`

## wom verify-config

**NAME**  
`verify-config` - Checks the WAN Optimization Manager configuration.

**MODULE**  
`wom`

**SYNTAX**

run verify-config

**DESCRIPTION**

You can use the verify-config component within the wom module to display configuration information about the WAN Optimization Manager that can be used for troubleshooting.

**SEE ALSO**

run, tmsh, wom diagnose-conn
